According to reliable information about 900 tons of ore is being treated daily at the Dome Mines. Mill heads are stated to have recently shown an average of about $9.80 a ton. Allowing for the usual small loss in recovery, it is evident that output has recently averaged about $8,400 daily or at the rate of about $250,000 a month.

In its best days, in 1916, the Dome treated ore at the rate of around 1,300 tons daily, but the average grade was around $5 to the ton. As a consequence of which for the year ended March 31, 1917, an output of $2,171,-784 was recorded. Thus, although present tonnage is not equal to that of 1916-17, the higher grade ore being treated serves to make the current rate of output the highest in the company's history. Were the Dome to be able to maintain an average output of a quarter of a million dollars monthly, or an annual production of around three million dollars, it can readily be seen that net profits would soar to new high levels.

Through fear of misleading the public the directorate of the Dome hesitates to present an official monthly statement, in that conditions over which there might be no control might arise, and, further, that in view of ore reserves being estimated to contain around $5.10 a ton, it could hardly be expected that mill heads will be held at the present high average and a favorable statement for a brief period might be found to be unreliable when calculating the value of shares as regards holding them over a long period. But the outlook is exceedingly favorable.

Developments at depth on the Dome Extension mine being conducted by the Dome Mines through the workings of the latter, and facilitated by reason of the great mining equipment and managerial organization of the Dome Company, is taking on proportions that leads to

the belief that the Dome Extension will on or before March next actually become a part of the Dome Mines itself.

Interests in the north who are watching the developments point to the nature of work on the Dome Extension as reasonable assurance that the Dome Mines Company already anticipate actually taking over the Dome Extension, in that the work being done is not only exploratory, but is preparatory to actual production. The terms which the Dome Company holds its option on Dome Extension is on a basis of thirty shares of Dome Extension for one share of Dome Mines. Here arises an interesting situation. For instance, the quotations for shares of the Dome Mines have recently ranged from $14 to $15 a share, while shares of the Dome Extension have ranged from 30 to 35 cents a share. In buying shares in the Dome Extension at 30 cents a share it is equivalent to buying shares in the Dome Mines at $9 a share or upwards of $5 of a saving—in reality, profit. In buying Dome Extension shares at even 35 cents a share is equivalent to buying shares in the Dome Mines at $10.50, provided, of course, that the option is exercised.

It is an interesting fact that the leading men of the Dome Mines Company already control the Dome Extension stock, which fact would appear to be reasonable assurance that the outlook is such as would indicate a successful consummation of the deal along the proposed lines. The situation appears to offer food for thought among those who speculate.

The question being asked is this: Is there actually a way in which Dome shares may be bought for $10.50 a share.

Mr. John A. Brownlee, who is interested in the development of the Lucky Cross property at Swastika, says:—

"The Marigold Mining Company, Limited bought the property of the Lucky Cross Bondholders Limited tnd started pumping out the workings the latter part of June, working two shifts, the operation took three weeks.

"When the 100 foot level was reached some assaying done returned high values in gold. The Company then decided to install a complete assaying plant which consisted of gasoline engine, crusher, pulverizer and complete equipment for all work necessary.

"Channel sampling was begun and extended from the surface to the 200 foot level and then to the face of the drift. Five foot sections were takn and careful checking of the assays gave returns of $17.20 per ton gold with an average width of 44 inches. Right at the 200 foot level there is five feet two inches of ore that averages $107.60 per ton.

"In the raise from the 200 and about 40 feet above that level 10 feet 5 inches of ore averages $15.60 for the entire width.

"Vein Number 4 on which there has been some surface work done averages $34.40 for two and a half feet."

L. P. Burns, Limited, announce the incorporation of a company under this name, which was formerly Burns & Roberts, Limited, of Toronto. The new company is still at the same address, 301 Bank of Hamilton Building, Toronto. They are manufacturers of tanks, boilers, smoke stacks, plate work, and specialize in new and used machinery of all kinds.

BRITISH COLUMBIA.

THE METAL MINES.

Victoria, B.C.

It appears to be likely that there will be considerable mining development in the Mount Sicker region, Vancouver Island. Following the recent announcement that New York interests had bonded the old copper holdings of the Tyee Copper Company, comes word that the Guggenheimers have acquired the Mount Brenton claims, which are located in the same district. It is stated that development work will be expedited and that if the expectations of the engineers who have reported upon the property are realized, mining will be carried on actively, a concentrator being installed and other necessary equipment provided.

Some months ago the Canadian newspapers carried a statement purporting to come from the Advisory Council for Scientific and Industrial Research to the effect that the prospects of an iron and steel industry being established on the Pacific Coast was extremely remote. Hon. Wm. Sloan, Minister of Mines, immediately took the matter up with Prof. A. B. McCallum, Administrative Chairman of the Research Board, who recently visited British Columbia. He called upon Mr. Sloan and assured him that when the full details of the Board's report are made public it will be found that nothing is said prejudicial to the future of the iron and steel industry in the Pacific Northwest.

The Sechart Mercury Mine, Vancouver Island, which has been idle for some time, has been purchased by Capt. E. H. Mansfield, who proposed to install a distillation plant to produce mercury on the ground. The property is well located for transportation, being situated on an island in Barclay Sound. The mercury content is about 2.5 per cent. If this mine becomes a producer it will be the second in British Columbia to produce quicksilver.

Merritt, B.C.

There have been a number of prominent mining men visiting the Merritt district during the past few weeks. Among them are Joseph Errington, M.E., of San Francisco; A. Leopold and Mr. Mills, of New York; C. G. Davis, representing English interests, and R. S. Lennie, K.C., of Vancouver, accompanied by N. W. Sweetser, M.E., Frank M. Hawkes, secretary of the Donohoe Mine Corporation, and J. F. Knapp, M.E., of Seattle. Messrs. Errington, Leopold and Mills are inspecting the Aspin Grove property. Messrs. Davis, Lennie and Sweeter have been going over the Aberdeen mine, which has been unwatered for their inspection. Messrs. Hawkes and Knapp are interested in the Donohoe Mine Corporation, and J. F. Knapp, M.E., of these properties will be actively developed. The Aspen Grove Amalgamated Mines, Limited, already have been diamond drilled and a considerable quantity of low-grade ore has been blocked out at the Aberdeen. R. R. Hedley, M.E., is prosecuting development work at the Mary Reynolds mine in the Stump Lake district. The new wagon road giving this and other properties transportation facilities, has been completed so that work may now proceed with an assurance that adequate supplies may readily be secured.

Alice Arm, B.C.

With the practical completion of the railway from Tidewater at Alice Arm to the Dolly Varden mine, the operators of other mines in the district are giving evidence of some concern as to the policy of the Taylor Engineering Company towards the handling on the railroad of ore from properties other than the Dolly Varden. The Alice Arm Commercial Club has taken the matter up with the Minister of Mines and the Minister of Railways. It is stated that the company is adverse to committing itself on this point and that as a result work on a number of properties at the head of Kitsault River is being delayed. Mr. Taylor, however, the manager of the Taylor Engineering Company, has given his assurance that everything will be done in his power to assist in the development of the mineral resources of the district.

Creston, B.C.

What is known as the British Columbia Iron Company, Limited, has been formed to develop forty claims situated about three miles west of Kitchener, B.C., and extending in a belt north and south which crosses the C.P.R. line at Thompson Creek. It is stated that this is one of the largest deposits of hematite in the province. Considerable work was done last Fall in opening it up and the management assert that a large body of hematite running from sixty to seventy-five per cent iron has been uncovered. E. C. Wragge, of Nelson, who is interested in the proposition, states that what has been discovered so far is very satisfactory. There are, however, some points to be determined before it can be asserted that this is a commercial proposition. It will take diamond drilling to obtain the knowledge required and the question of taking this step is now being discussed.

Nelson, B.C.

A school for prospectors is likely to be opened this winter in Nelson, B.C. The proposal is favored by the school board of that city and if an instructor can be obtained with the necessary qualifications action will be taken. It is felt that laboratory training and lectures to prospectors would be of material value to the prospectors of the adjacent district and of ultimate benefit to the mining industry.

Construction of a small concentrator on the Emerald Silver-Lead Mine property, Sheep Creek district, is making good progress according to R. W. Mifflin, the superintendent. The work is expected to be complete by the end of November. The plant, which, by running two shifts a day, will have a daily capacity of 30 tons, is designed primarily to demonstrate the feasibility of treating the ore of the Emerald Mine in which lead predominates, by this method.

The plant of the French Complex Ore Reduction Company has been closed down. This enterprise has been supported by the Provincial Government to the extent of about $65,000, which purpose was to demonstrate the practicability of treating with commercial success the fractious silver-lead-zinc ores of the Kootenays by means of the French electroyitical process. A company was formed consisting mainly of Victoria and Nelson men, by whom the patents are held. In addition to the experimental plant at Nelson, one was installed at the Standard Mine at Silverton. The Canadian Consolidated Mining and Smelting Company took an option on the process but did not close on it, having developed in its own plant an electro-chemical process which met its requirements. While the Nelson plant has gone out of operation and the loans made by the Government thus will have to be written off. It is claimed by Mr. French that the Company's experimental work is responsible for the ultimate success attending the development of the electro-chemical processes in the handling of complex zinc ore.

Trial, B.C.

The Consolidated Mining & Smelting Company has offered a scholarship to the student who is the son of any of its employees making the highest marks in the 1919 matriculation examination. The award consists of an allowance of $500.00 a year toward an applied science course, the same to be taken at the British Columbia University or any other Canadian university. S. G. Blaylock, general manager of the company, now is applying for applications for this scholarship. He explains that these applications must be accompanied by a statement of the marks obtained, the name of the father of the applicant and the position the latter holds in the company.

Ore receipts in gross tons for the week from August 14 to August 21, inclusive, at the Canadian Consolidated Company's smelter at Trail, totalled 5,492 tons. This makes an aggregate for the year of 222,987 tons. The heaviest shipper for the week was the Centre Star Mine of Roseland with 2,151 tons, while next in order is the Sullivan Mine of Kimberley.

Kaslo, B.C.

A new road has been constructed to the California Mine, and what is known as the Athabasca mill, is expected to be in operation on ore from this mine within the next two months.

Grand Forks, B.C.

The possibility of the Granby Consolidated Mining and Smelting Company resuming operations at Grand Forks is the subject of considerable speculation. The smelter at Grand Forks was closed down in June, the reason given being lack of coke, occasioned by labor trouble in the Crows Nest Pass district. At the time of the cessation of operations the price of copper was so low that the prospects were not particularly encouraging. Since the close-down Granby officials at Phoenix and Grand Forks are said to have been working on several schemes for the handling of at least fifty thousand tons of good grade ore from the Phoenix property. Shipment to Trail smelters or to Anyox and the installation of a concentrator at the mine, are plans reported to have been considered. There is no doubt, however, that there is the quantity of ore mentioned available and that the company is desirous of treating it before withdrawing entirely from the camp. Having this in mind, and the fact that the coal mines of the Crows Nest are now in operation, which assures a supply of coke, those interested in the district are hopeful that the smelter will be reopened. And meanwhile the citizens of Greenwood are said to have opened negotiations, having in view the acquirement of the Granby Company's ore at Phoenix. This, presumably, would be used by the Greenwood people in their operations of the Canada Copper Company's smelter, providing the same is secured by them in the negotiations now under way.

Greenwood, B.C.

Negotiations between the committee of the citizens of Greenwood and the Canada Copper Corporation, whereby the former propose to take over the Company's properties at Phoenix and the smelter at Greenwood, are said to be practically completed, requiring only ratification by the directors of the company to be effected. Those interested in the transaction are hoping that it may be possible to have the smelter blown in before the end of the year.

THE COLLIERIES.

British Columbia Coal Output in July.

The output of the coal mines of British Columbia for the month of July totalled 143,341 tons, which was made up as follows:

	Tons.
Corbin Coal and Coke Co.	221
Middlesboro Coal Mines, Ltd.	7,216
Fleming Coal Co.	3,477
Coalmont Coal Company	1,800
Princeton Coal Mines, Ltd.	1,104
Canadian Western Fuel Co., Nanaimo	43,612
Canadian Collieries (D), Ltd., Comox	41,782
" " " " Extension	17,714
" " " " S. Wellington	6,966
Pacific Coast Coal Mines, S. Wellington	4,208
B. C. Coal Mines, E. Wellington	3,851
Nanoose Collieries	1,915
Granby Collieries, Ltd., Cassidy's	7,475
Total	143,341

Alberta Collieries Resume Normal Operation.

Conditions are gradually resuming the normal in District 18, U.M.W. of A., which comprises Eastern British Columbia and the Province of Alberta, and according to reports received by the Minister of Labor up to the 25th of August, thirty-one of the leading coal mines of the district are again being worked. This represents sixty percent of the total output. While some opposition still is being experienced by the officials of the United Mine Workers from advocates of the One Big Union Idea, the resistance of the latter appears to be declining.

The books, papers and monies, property of the International Mine Workers of America, District 18, which were in the custody of Edward Brown, secretary of the International of Calgary, who later transferred his allegiance to the O.B.U., have been handed over to International officers. The latter have left to attend the convention to be held at Cleveland, Ohio, at which it is expected there will be some representation of District 18, if the same can be arranged.

The Coal Commissioner, W. H. Armstrong, in a recent statement said that the O.B.U., as far as District 18 is concerned is non-existent. He asserts that the miners who forsook the International Union are seeking reinstatement and that their applications are being granted in the majority of cases. He said that the men are going back on exactly the same terms as they were working before but that when they were in a position to sign a contract it was likely that a new agreement would be entered into between them and the miner owners. During the strike between 8,000 and 9,000 men were idle, and the wives and families of the miners suffered to a considerable extent. The mines, however, were not materially affected, and while it might be a few weeks before full shifts could be taken back, they all would be working in the near future.

Coal Shortage Next Winter Not Anticipated.

Commissioner Armstrong predicted that there would be no shortage of coal this winter because, although the mines were idle for several months, the capacity production is greater than the demand during the autumn months and by working to capacity the reserve stocks for winter can be restored.

An advance of fifty cents a ton on Western Canadian coal is prophesied by D. H. Connor, assistant to the Fuel Controller of Canada, who has returned after an inspection of the Alberta mines. He states that an adequate supply of cars will be available for the transport of coal during the winter months.

Notwithstanding that it has been said by operators and others that no shortage need be feared in the Canadian West, the Canadian Commission of Conservation, is surveying the situation throughout the Dominion, asserts that it is almost a certainty that the supply will be inadequate. Up to June 7 of the present year the total production of anthracite was only 33,349,500 net tons, as compared with 42,858,000 tons in the corresponding period of 1918, a decrease of 9,500,000 tons, or 22 per cent. It is assumed that the 1919 production will be less than 80,000,000 tons, whereas the production last year was 99.514,334 tons. Thus a shortage of 20,000,000 tons, or 20 per cent, is anticipated.

DISCOVERY OF COLD WATER THAWING PROCESS IN YUKON GOLD AREAS.

The work of dredging the famous Bonanza and Eldorado creeks, a total length of forty miles, has been completed and the dredges which did the work and which belong to the Guggenheim or Yukon Gold fleet, have been dismantled and hauled to Dawson. On August 25th, the first of the two left Dawson by steamer for Seattle via St. Michael, her final destination being unknown. It is reported the Guggenheim may send them to Burma, India or the Malay Peninsula to dig tin. Dredges owned by the same Company are operating on Hunker, Gold Run and Bear creeks, and one at Guggieville on the Klondike River.

With several years life ahead of this field and prospects that a new discovery in cold water thawing will reduce the cost of thawing one-half, many more miles of low-grade properties in this country will be brought into profitable operating range. It is known that one hundred miles of dredging ground remain to be worked in the vicinity of Dawson.

It is claimed that every camp in the frozen ground of Alaska and the Yukon will benefit by the cold water system which will give increased acreage and prolonged life. The Yukon Gold Company of Dawson, up to August 27th, have turned over yardage which exceeds several times that removed at the Panama Canal.

Many hydraulic plants are still working gold on the high benches of Bonanza and Klondike river and also on the numerous Hunker hills. The Canadian Klondike Company are operating steadily three large dredges on the Upper Yukon Valley. The gold yield to date is $200,000,000. It is estimated that fully that much more will be received before the camp placers are exhausted.

For those who are not familiar with the cold water thawing, this is practically the same as steam, using points or even pipe with hose attached through the water is forced at a pressure into the ground. As long as the pressure is kept up there is no danger of freezing. A ten foot pipe will force its way into the ground and the earth about for three or four feet will be loosened up and thawed out in about an hour's time with a pressure of from forty to sixty pounds.

DISCOVERY OF FREE MILLING GOLD AT DRUM LUMMON.

Prof. Edwin T. Hodge, of the University of B. C. has just completed a report on the Drum Lummon mine near Hartley Bay, Douglas Channel, in which he comments on the discovery of free milling gold in the workings of this mine.

Prof. Hodge declares that there is a wonderful showing on this property, not only of high-grade copper and gold, but of other minerals, the formations being of a rare nature, almost suggestive of gems.

In his report, Prof. Hodge, says: "This property is usually looked upon as a copper mine, but I am of the opinion that gold values may be the determining fact or in making it a productive mine. Every sample that I have taken shows a trace of gold. The gold occurs as irregular shaped nuggets, as sheets and as tiny flakes, but in close association with shalcocite and bornite.

"Gold values are constant in all the ore. Small gold shoots have been found and I anticipate the finding of larger gold shoots, some, perhaps, of bonanza type. The finding of a few large shoots of rich ore is one of the possibilities in this property—a possibility which makes it worthy of further development."

Mr. Porteaus Sloan, managing director of the company, who arrived in Vancouver from the mine the first week in August says that the work of driving the west drift, in which high-grade copper was encountered last year a further distance of 2000 ft. will be undertaken at once. This was suggested by Prof. Hodge after examining the mine and the geology of the locality.

The high values in the mine are being maintained as the drill is advanced, declares Mr. Sloan. A large amount of ore has already been blocked out and exploration work will be carried on through the winter. Shipments of concentrates are being made to the smelters at Tacoma, the mill recently installed concentrating the general run of the mine.

COAL-MINING IN SPITSBERGEN.

Coal was first discovered in Spitsbergen in 1900, when a Norwegian ship exported the first cargo. The Gulf Stream affects the climate on the west coast of the island, where the principal settlements are found, most of the claims being taken up by Norwegian, English, Swedish, and Russian companies.

The Norwegian Spitsbergen Company, which is the principal concern, has acquired one English, one American and one Norwegian company, and in two years exported 85,000 tons of coal. Six other Norwegian companies have started work during the last few years.

The coal, according to the **Teknisk Ukeblad,** is of superior quality, containing very little ash, is comparatively free from sulphur and has a high calorific value, varying from 13,000 to 14,500 B.Th.U. per 1 lb. It is excellent steam coal, but does not contain sufficient volatile matter for a gas coal. It does not clinker.

Mining is easy, as the ground is frozen to a great depth and perfectly dry. There is very little dust and no fire-damp. The temperature of the headings seldom rises above 25 deg. F., but the absence of humidity makes the low temperature quite tolerable. The coal is found below a bed of smooth sandstone, which forms an excellent safe roof.

The upper tertiary beds, which contain the best coal, consist of three seams with a combined thickness of 6 ft. They are separated by beds of shale 1 to 2 ft. thick, and nearly horizontal; the dip being only 2-3 deg. Sporadically, the dip increases to 10-12 deg.

The coal in the lowest steam, which is 3 ft. 3 in. thick, is free from shale or other impurities.

RECENT MINING INCORPORATIONS.

Davidson Consolidated Gold Mines, Limited, Incorporators: Joseph Montgomery, barrister-at-law; Daniel Alexander Sherriff and Russel Edwards Evans, accountants; Elsie White, book-keeper; and May Stern, stenographer—all of Toronto. Capital $5,000,000, divided into 5,000,000 shares of $1 each. Head office, Toronto.

Symmes-Young Silver Mines, Limited (no personal liability.) Incorporators: Mervil MacDonald, Geoffrey Walters Adams, and Percy Edwin Smily, barristers-at-law; Robert Roy McKay, student-at-law; and Bertha Rice, stenographer—all of Toronto. Capital $2,000,000, divided into 2,000,000 shares of $1 each. Head office, Toronto.

Nipissing Extension Mines, Limited. Incorporators: John Wellington Pickup, solicitor; Thomas Arthur Dark, actuary; Charles Quincy Parker, company secretary; Harold Aldis Bernard, insurance clerk; and George Barner, accountant—all of Toronto. Capital $3,000,000, divided into 3,000,000 shares of $1 each. Head office, Toronto.

The Brown Feldspar Potash, Limited. Incorporators: Lena Adams, bookkeeper; Henry Cartwright Secord, broker; Kenneth Alexander McRae, engineer; Mary Winnifred Hunt, stenographer; and Mabel Gray, teacher—all of Toronto. Capital $500,000, divided into 500,000 shares of $1 each. Head office, Toronto.

Granby-Kirkland Gold mines, Limited. Incorporators: Newton Carman Shaver, prospector; Verneta Brown Shaver, Claudene Brown Bagshaw, and Dorothy Howard Brown, married women—all of Toronto; and Howard Milton Brown, Chicago, Ill., sales manager. Capital $2,000,000, divided into 2,000,000 shares of $1 each. Head office, Toronto.

Camburn Silver Mines, Limited (no personal liability.) Incorporators: Archibald Woodburn Langmuir, Donald Black Sinclair, and Harold Wilson Shapley, solicitors; George Charles Loveys, accountant; and Jennie Jardine Elliott Hayes, office secretary—all of Toronto. Capital $1,500,000, divided into 1,500,000 shares of $1 each. Head office, Toronto.

Pittsburg and Northern Ontario Exploration and Development Company, Limited. Incorporators: George Arthur Young, broker; James Howard Young, insurance agent; Joseph Edward Hallatt, prospector; Norman Currie Urquhart, accountant; and Eva Leach, stenographer—all of Toronto. Capital $100,000, divided into 10,000 shares of $10 each. Head office, Toronto.

Book Review

MINERAL DEPOSITS. By Waldemar Lindgren, professor of economic geology, Massachusetts Institute of Technology, and formerly geologist U. S. Geological Survey. Published by McGraw-Hill Book Co., New York.

This is the second edition of a splendid book. The author has endeavored to bring the subject up to date, and, owing to his exceptional ability, has been very successful in interpreting the results of recent investigations and in giving them the proper place in the discussions. All of the chapters have been revised and many of them largely rewritten. The result is an up to the minute treatise by a man who has an international reputation as a geologist.

Dr. Lindgren takes up the subject of mineral deposits in a scientific and at the same time simple manner. He makes it plain at the outset that the intelligent study of mineral deposits requires a very good working knowledge of physics and chemistry, as well as keen observation on the part of the student. To such readers the book will seem in part a very elementary treatise; but this very simplicity helps one to follow the application of principles to the particular deposits selected as examples.

In the introductory chapter the author first gives definitions of the terms used in economic geology. He refers briefly to the occurrence of metals in the earth's crust, and to their value.

In a chapter on formation of minerals there is discussed solution and precipitation; influence of pressure and temperature; precipitation by evaporation, by reaction between solutions and solids and between gases or gases and solutions. Crystalline minerals and colloids are described.

Then follow three chapters on underground waterflow, composition and chemical work of. In these three chapters a very good idea of the nature and behavior of the water circulating in the rocks is given. Particularly instructive is the discussion on alteration of rocks by the formation of new minerals which take the place of other minerals which have been removed by the same agency.

The author then discusses the origin of underground waters. He makes it clear that most of the water is of meteoric origin—such water as we have at the surface, but temporarily laden with mineral substances dissolved from the rocks, and thus potential formers of new mineral deposits. Of less volume, but also of great importance, are the magmatic or juvenile waters, such as escape from some springs in volcanic regions.

Spring deposits and the relation of mineral deposits to mineral springs form the subject of two chapters. Interesting and significant are the descriptions of deposits now being formed by hot springs.

Chapter 9 deals with folding and faulting. Faults are classified and several types described.

Openings in rocks, is the subject of the next chapter. Cavities originate in many ways; by original mode of formation, as in the case of amygdaloidal volcanic rocks; by solution as in limestones; by fractures such as contraction joints produced by tensile stress or shrinkage; expansion joints as in serpentines. Fissures are also produced by torsional stress; by folding of sedimentary strata, by shearing stress under action of gravity and by compressive stress.

The next two chapters deal with the form and structure of mineral deposits and their texture. Here comes the natural classification into two groups — those ore deposits which were formed with the rocks that enclose them and those were which formed later than the enclosing rocks. The former are called syngenetic and the latter epigenetic. The author attaches less importance to form than to mineral association in classifying deposits, but he points out that the form, while often largely accidental, is of great importance in mining. He defines veins, lodes, sheeted zones, stockwork, stringer lode, pipe, ladder veins, lenticular veins, bed veins, gash veins and vein systems. Texture of the deposits is considered with reference to the temperature of formation. In veins formed at lower temperatures and comparatively shallow depths crustified and drusy forms and fine granular texture predominate, while in deep seated veins the texture is commonly coarsely crystalline and massive. Crushing and brecciation of the early minerals is extremely common, and repeated opening of the fissure is sometimes indicated by the texture of the deposit.

The occurrence and form of ore-shoots is dealt with in chapter 13. The deposition of valuable minerals from solutions is partly by decrease in pressure and temperature, but there are important accompanying factors such as favorable character of the wall rock. A number of diagrams are used with the text to illustrate various forms of ore-shoots and the influence of rocks and intersections.

The classification of mineral deposits is then taken up. Grouping by substances and uses is briefly referred to. A genetic classification is adopted as most desirable, both theoretically and practically. The author considers that each deposit should be considered as a problem in physical chemistry. In his scheme he makes two major divisions: (1) The deposits such as placers formed by mechanical processes of concentration. (2) The great majority of deposits which have been produced by chemical processes of concentration. Two cases are distinguished; the substances were originally contained in the same geological body in which the deposit is found, or they may have been introduced from the outside. Most metal deposits belong to the latter class. Deposits of this kind occur along fissures or from replacements along fissures or are found in general where opportunity is offered for vigorous circulation of the depositing waters.

The metal deposits genetically connected with igneous rocks are sub-divided into several groups according to the evidence of mineral association and geological relations.

The first group includes ores deposited at slight depth below the surface; the temperature is here relatively low, perhaps from 50 deg. to 150 deg. C. and the pressure will scarcely exceed 100 atmospheres. Examples of this group are found in the gold and silver veins of Tonopah, the Cripple Creek gold telluride veins and the California quicksilver veins.

A second group of deposits was formed by hot ascending waters at moderate depths, say from 5,000 to 10,000 feet below the surface at temperature of perhaps 150 deg. to 250 deg. C and correspondingly increased pressure. Examples of these are the gold-quartz veins of California and the metasomatic pyritic deposits of Leadville.

A third, deep seated group includes veins and contact-metamorphic deposits. The temperature of for-

mation in these cases was high, but in most cases below 575 deg. C, the crystallographic inversion point for quartz. The pressure was probably very high. Some gold quartz veins, including those of the Porcupine and Kirkland Lake districts, Ontario, are placed in this group. Cassiterite veins and tourmaline-copper veins are also in this group.

Another class of deposits includes those formed by concentration in igneous magmas, as in the case of the iron ores of northern Sweden and the nickel-copper ores of the Sudbury district, Ontario.

Following these introductory chapters, which take up 206 pages, comes the description of ore deposits in groups in accordance with the scheme of classification adopted. The chapter headings are:

15. Deposits formed by mechanical processes of transportation and concentration; detrital deposits.
16. Deposits produced by chemical processes of concentration in bodies of surface water by reaction between solutions.
17. Deposits formed by evaporation of bodies of surface waters.
18. Deposits formed from processes of rock decay and weathering.
19. The hematite deposits of the Lake Superior region.
20. Deposits formed by concentration of substances contained in the surrounding rocks, by means of circulating waters.
21. Deposits resulting from regional metamorphism.
22. Deposits of native copper with zeolites in basic lavas.
23. Lead and zinc deposits in sedimentary rocks; origin independent or igneous activity.
24. Deposits formed near the surface by ascending thermal waters and in genetic connection with igneous rocks.
25. Deposits formed at intermediate depths by ascending thermal waters and in genetic connection with intrusive rocks.
26. Veins and replacement deposits formed at high temperatures and pressure and in genetic connection with intrusive rocks.
27. Deposits formed by processes of igneous matamorphism.
28. Deposits of the pegmatite dikes.
29. Deposits formed by concentration in molten magmas.
30. Metamorphiosed deposits.

These chapter headings summarize the author's scheme of classification. In each chapter will be found described a group of deposits. Examples are taken from all parts of the world, but American deposits naturally receive the most attention. Many Canadian mining districts are referred to. In chapter 15 there are many references to the Klondike gold deposits. The Quebec asbestos deposits come in the group treated in chapter 20. In chapter 25 the Nova Scotia and Deloro gold deposits are mentioned, and the Cobalt silver deposits receive special attention. This chapter and the succeeding one, which deals with the group which includes many of the gold deposits of Ontario, are specially well worth reading. What Dr. Lindgren has to say about the gold deposits dealt with in these two chapters should prove useful to anyone interested in the development of gold properties in Canada.

In chapter 27 the Hedley gold deposit at Hedley, B.C., is described as the best known example of the gold-arsenopyrite type formed by ingneous metamorphism. The graphite deposits of Eastern Ontario and Quebec and the copper deposits of the boundary district, B.C., are also described here. The Canadian mica deposits are mentioned in chapter 28, and some of the molybdenite deposits belong to this group. In chapter 29 the Sudbury nickel-copper deposits, the Quebec chromite deposits and the Ontario corundum deposits are mentioned. The Sudbury deposits are described at some length.

Chapter 31 deals with the oxidation of metallic ores by weathering agencies. It is noted that in glaciated areas there has been comparatively little oxidation since the glaciers cleaned away the older accumulations of weathered products. In other areas oxidation may extend to very considerable depth and the proper interpretation of surface outcrops necessitates a good working knowledge of the nature of the alterations that take place as a result of exposure.

In chapter 32 an attempt is made to group ore deposits by reference to the metallogenetic epochs or time intervals favorable for the deposition of certain useful minerals. In treating those of North America the author deals separately with those of the east and of the west. In the east he distinguishes: 1, the Pre-Cambrian epochs; 2, Paleozoic sedimentary epochs; 3, Paleozoic epochs of saline deposits; 4, epochs of Triassic copper deposits; 5, Cretaceous and later periods of lead and zinc concentration; 6, Tertiary and recent products of rock decay.

In the Western or Cordilleran part of the continent Dr. Lindgren distinguishes: 1, The Pre-Cambrian epoch; 2, The Early Mesozoic epoch; 3, The Late Mesozoic epochs; 4, The Early Tertiary epoch; 5, The Late Tertiary epoch; 6, The Post-Pliocene epoch; 7, Cretaceous or later epochs of copper concentration in sedimentary rocks.—R. E. H.

COAL SITUATION AND MINERAL PRODUCTION IN NEW SOUTH WALES.

Sydney, as the chief commercial entrepot of Australia, largely owes its position to the existence of the most valuable coal mines in Australia at its feet. The coal deposits, which are almost inexhaustible, extend 100 miles north, south, and west of Sydney—also under the bed of the Pacific Ocean to an undetermined extent. The coal is of the highest grade and suitable for all purposes, such as gas making, coke making, household or factory purposes, and for bunkering steamers.

Labour troubles in connection with the mining of coal are always existent, and one trouble is no sooner settled than another crops up. Two years ago the price of coal was, at the instance of the Government, put up three shillings per ton, which, of course, meant an increased hewing rate. Labour troubles have again arisen, and the Commonwealth Government has therefore intervened and announced its intention to take over the mines of New South Wales, and a proclamation has been issued to that effect. According to the Canadian Government Trade Commissioner at Sydney, there is much talk about nationalisation," and this action, of course, again resurrects such suppositions; but what the ultimate end will be remains to be seen.

The coal trade of the State has of course been considerably interrupted during the war period, foreign exportation having almost entirely ceased owing to the cost and difficulty of obtaining freightage. Business relations with foreign buyers have, however,

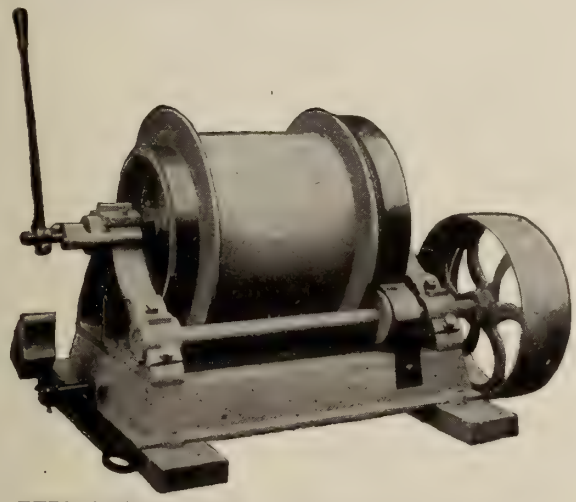
MINE HOISTS—Any Size

From 10 H.P. to 50 H.P.

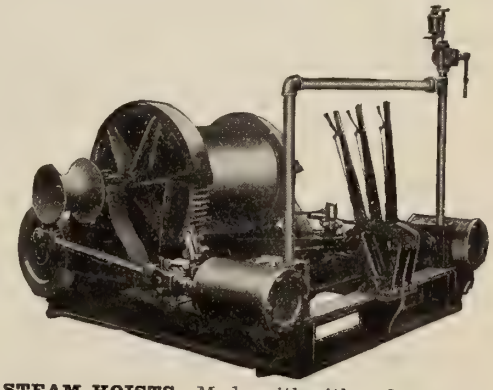
Your choice of either STEAM, ELECTRIC or BELT DRIVE

We make two distinct types of Mine Hoists
DRUMS, FRICTION DRIVEN, revolving only when Frictions are engaged. Load may be lowered by gravity, without expenriture of power, controlled by the powerful Band Brake.
FIXED DRUMS, keyed fast to shaft. Drums cannot revolve in either direction except driven by the engines or motor. The load is under absolute positive control at all times.

ELECTRIC HOISTS—Made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base to receive the motor.



BELT HOISTS—Made in the same large range of sizes as the Steam and Electric Hoists.



STEAM HOISTS—Made with either One Drum or Two Drums.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

again been resumed, but labour troubles which are at present looming, appear as if they would cause another interruption to trading relations.

Mineral Output for 1918.

War prices for most metals made the New South Wales mineral output for 1918 a record so far as value is concerned. The production totalled £14,391,981, which was £1,439,262 better than 1917, the State's previous best.

There was also a small recovery in the gold won—87,145 ounces, valued at £369,473, as compared with 82,171 ounces valued at £349,038 in the year 1917. Most of the gold now obtained is extracted from copper ore in its treatment. Of the £696,580 worth of copper produced, £501,685 was obtained from the great Cobar copper mine, which, owing to the reduced price of copper and labour troubles, has been closed down for the present.

Tin gave £548,876 in 1918, compared with £373,696 in 1917.

The output of the silver-lead mines was £5,712,138, being an increase of £600,000 over the previous year.

The aggregate mineral production of the States now totals £300,499,184, of which coal has provided the major part of £92,721,420, silver-lead £86,235,094, gold, £62,368,521, copper £14,988,804, zinc £13,000,000, and tin £11,511,880.

Coke Production.

Upwards of one-half of all the coke produced in the state of New South Wales, the value of which last year was £387,000, is produced in the Illawarra District (40 miles from Sydney), the balance being produced at Newcastle and the western districts. Owing to the closing down of the metalliferous industry in many directions, there has been a large curtailment of smelting operations. Consequently huge stacks of coke have accumulated and most of the works are only running half time. Not long ago the main concern of the managers was the securing of sufficient slack for the purpose, but at present their trouble is to use all the slack available.

BELGIAN COLLIERIES RECOVERING

The total Belgian output of coal during July amounted to very nearly 87 per cent. of the average monthly production during 1913. In the Mons and central districts the coal output in July reached practically the pre-war output. In the Charleroi the output amounted to 85 per cent. and in the Liege district 77 per cent.

PERSONALS.

Mr. P. E. Hopkins of the Ontario Bureau of Mines has gone to the Wasapika gold area, where he will spend the balance of the field season in geological mapping of the area.

Mr. A. G. Burrows of the Ontario Bureau of Mines is now at Metachewan, revisiting the gold properties there. He will be at Matachewan a short time and will then go to Gowganda.

Mr. M. Y. Williams of the Geological Survey, Ottawa, who is an authority on the geology of oil areas, and Mr. Jos. Keele of the Mines Branch, Ottawa, who specializes in clays, are making examinations along the proposed T. & N. O. railway extension north of Cochrane.

:-: EDITORIAL :-:

NANAIMO MINE-RESCUE AND FIRST AID MEET.

We are pleased to receive from the Journal's British Columbia correspondent an account of the first international mine-rescue and first-aid competition ever held in the Pacific North-West, which was a feature of the Labour Day Meet of the Vancouver Island Mine Safety Association at Nanaimo.

Nowhere is international co-operation and good fellowship more appropriately shown than in humanitarian endeavour and in the amelioration of industrial hazards.

The "Journal" is glad to second the suggestion that Vancouver Island teams should be sent to take part in the Pittsburgh Safety Meet. Mr. Sloan, the Minister of Mines of British Columbia, is apparently a Minister who is vitally interested in the Department under his charge, and in attending the Vancouver Island Safety Meet he has displayed a proper conception of his duties of his office. Even emulation in good works is apt to pall if official approval is not prominently displayed, and writing from a distance, the "Journal" desires to congratulate most heartily all those who helped to organize the competition and to defray the expenses connected with it. It is time and money excellently well spent.

The keenness of the tests on which the marks were accredited to the competing teams is also a welcome evidence of a realization on the part of the organizers of mine rescue teams equipped with breathing apparatus that rescue work should not be attempted without rigorous tests of the tightness and general safety of breathing apparatus. A defective apparatus spells only an additional casualty.

THE PORT COLBORNE ELEVATOR EXPLOSION.

The dust explosion at the Port Colborne elevator is a reminder that dust detonation is a danger not confined to coal mines, but that it is present wherever combustible matter is disseminated and suspended in the atmosphere as impalpable dust. Flour mills, grain elevators, mine screening-plants are not distinguishable from coal-mines in this regard, except in so far as the passages and workings of a dusty mine contain a percentage of inflammable gases. The dissemination of carbonaceous material through the atmosphere causes that intimate admixture with the oxygen of the air which gives every dust particle the potentialities of rapid combustion accompanied by rapid expansion of liberated gases that constitute a truly explosive mixture. One of the singular features of coal mines regulation has been the disinclination of mining men to believe in the explosive properties of floating coal-dust, and there are those even yet who are not fully convinced judging by the risks they take in lightly regarding the presence of coal-dust as a source of danger. The persistence of coal-miners in continuing to use black powder, with primitive methods of detonation, naked lights, bare electric wiring, and unenclosed electric motors in the presence of coal-dust, usually associated with a little gas and modern methods of copious and swiftly moving ventilation currents, is an anachronism that would be speedily corrected if coal-miners really believed that coal-dust will detonate.

Accumulations of inflammable gas are usually regarded as the predisposing cause of most disastrous coal mine explosions, but a little analysis of the circumstances accompanying colliery explosions will reveal that a significantly large proportion of them were brought about by improper methods of blasting the coal in the presence of coal-dust, and probably only a trifling percentage of gas.

Dusty roads, black powder, "squib" detonation, naked lights; these are the forerunners of the coroner's inquest on coal miners.

CALCULATIONS ON THE COST OF LIVING.

The tabulation contained in the monthly issue of the "Labour Gazette" showing the cost of food-stuffs, coal, rent and light, averaged over the representative population centres of Canada, has been a source of authoritative reference much used in the past five years, and those who have had occasion to follow the flight of living costs into the empyrean can bear testimony to the general accuracy of these figures. Their usefulness has however, been limited by the absence of comparative figures on the costs of boots and clothing, items of the weekly budget that are becoming of ever-increasing importance, not to say concern.

Calculations of the cost of living are invidious ones to make, and their accuracy can be impugned on a thousand categories, according as one is buying or selling labour. The percentage of living expenses borne by the individual items that compose them will vary according to social status, occupational requirements, and individual preferences. The bulking of the item of food-stuffs becomes larger and more menacing as the "margin of subsistence" is approached, but while in the case of the man with small wages and a large family in the dependent stage, the increase of the cost of food-stuffs by one hundred per cent may necessitate an increase of his wages by almost the same amount unless his relative financial position is to be impaired, this

becomes less the case as the expenditures outside of food-stuffs increase.

For this reason, among many others, the usefulness of cost of living statistics is nullified unless it includes all the necessary items of life, among which boots and clothing must be numbered.

If it should be that the index number is about to descend from its celestial expedition, the necessity for some unbiased and authoritative reference will become even more apparent.

It has recently been stated by Prof. Nicholson, a student of economics, that the real workingman stands to gain much more by the decline of prices than by further increases in wages, but the divergment of opinion on this question, if prices ever do come down, will be just as wide as the gulf between Dives and Lazarus.

We would suggest for the consideration of the Department of Labour that it should attempt to increase the statistical value of the "Family Budget" tabulation by including the items of boots and clothing. The difficulties of doing this are great, admittedly great, but it seems quite necessary that the calculation should be a complete one.

In this connection it is interesting to note that the "Labor Gazette" for August contains a complete and detailed calculation of the average family budget for the periods 1908-10, 1913 and 1918, which include clothing item by item. This is a commendable innovation, and having gone so far, it should be less difficult to enlarge the scope of the familiar calculation of the "Weekly Budget."

It has been suggested by persons who had private axes to grind that the cost of living calculations of the Department of Labour were "faked," the reason given being partly political, and partly based on local price vagaries, but those who make such a statement betray their ignorance of the intricacy of the calculation, the interesting affect of the "mass average" in eliminating local error, and the practical impossibility of "faking" statistics of this kind. It is said that a liar must have a good memory, but the cost of living statistician who attempted to arrange his figures so as to achieve certain ends, regardless of the accuracy of such figures, would require to have not only a phenomenal memory, but would have to be the champion of liars.

We must realize that the wastes of war can only be made good by hard work and not by soft money.

With the abandonment of soft money the soft ways of making money must also be abandoned.

We must try to get back to the pre-war methods of larger production with narrower margins for profit. It is hopeless to tell labor to work more and produce more if there is to be artificial scarcity to secure higher prices.

If capital still tries to continue on the methods of scarcity and monopoly and high prices — I do not say all capital, but enough to be noticeable — there is a real danger of social insecurity.

Capital is asking in some quarters for governmental insurance against falling prices. I venture to say that falling prices are a necessary insurance for the security of capital in general.

A continuance of the raise in prices is not only dangerous to capital, because it may bring social revolution into the range of practical politics, but it is dangerous in a more particular way — the way namely of **foreign trade.**

The real working classes stand to benefit more by falling prices than by rising money wages.

Extracts from a letter given to the staff of Barclay's Bank, London, by Prof. J. S. Nicholson.

CONSOLIDATION OF CORUNDUM MANUFACTURERS.

The International Abrasive Corporation is making application for listing on the Boston Stock Exchange.

This consolidation is of interest to Canadian readers as it is comprised of the Superior Corundum Wheel Company, Dominion Abrasive Wheel Company, Harrison Supply Company, and National Abrasive Company with plant at Waltham, Mass., Amesbury, Mass., Niagara Falls, Ont., and Mimico, Ont. Three of these companies are successfully established. The National Abrasive Company is a new producer.

It is stated that the new Company will be the only producer of "Natite," said to be the most successful of manufactured corundums, and it is claimed that a ton of this patented product can be produced for $14.25 against $30 per ton of corundum by the ordinary bauxite process.

The situation of the plants of the Company in both Canada and the United States is expected to give maximum tariff advantages.

BRITTANIA MINING CO., HOWE SOUND, SHOWING RECORD PRODUCTION.

The mine and plant of the Britannia Mining Company, Howe Sound, are working to capacity, and the production records are the highest in the history of the company. The mill is treating about 2,500 tons a day and producing about 2,000,000 pounds of copper per month. The Brittania mine has now four levels extended through Britannia Mountain, connecting with the Empress group. During the past year new developments aggregated 24,595 feet. Diamond drilling was done to the extent of 26,682 feet. Raises are now being driven to connect the 2,700 feet level with the 4,100 or mill level, so that ore can be delivered by gravity to the ore cars on the mill level. This permits the underground transportation of all ore and overcomes winter interruptions to transportation.

Larder Lake District, Northern Ontario

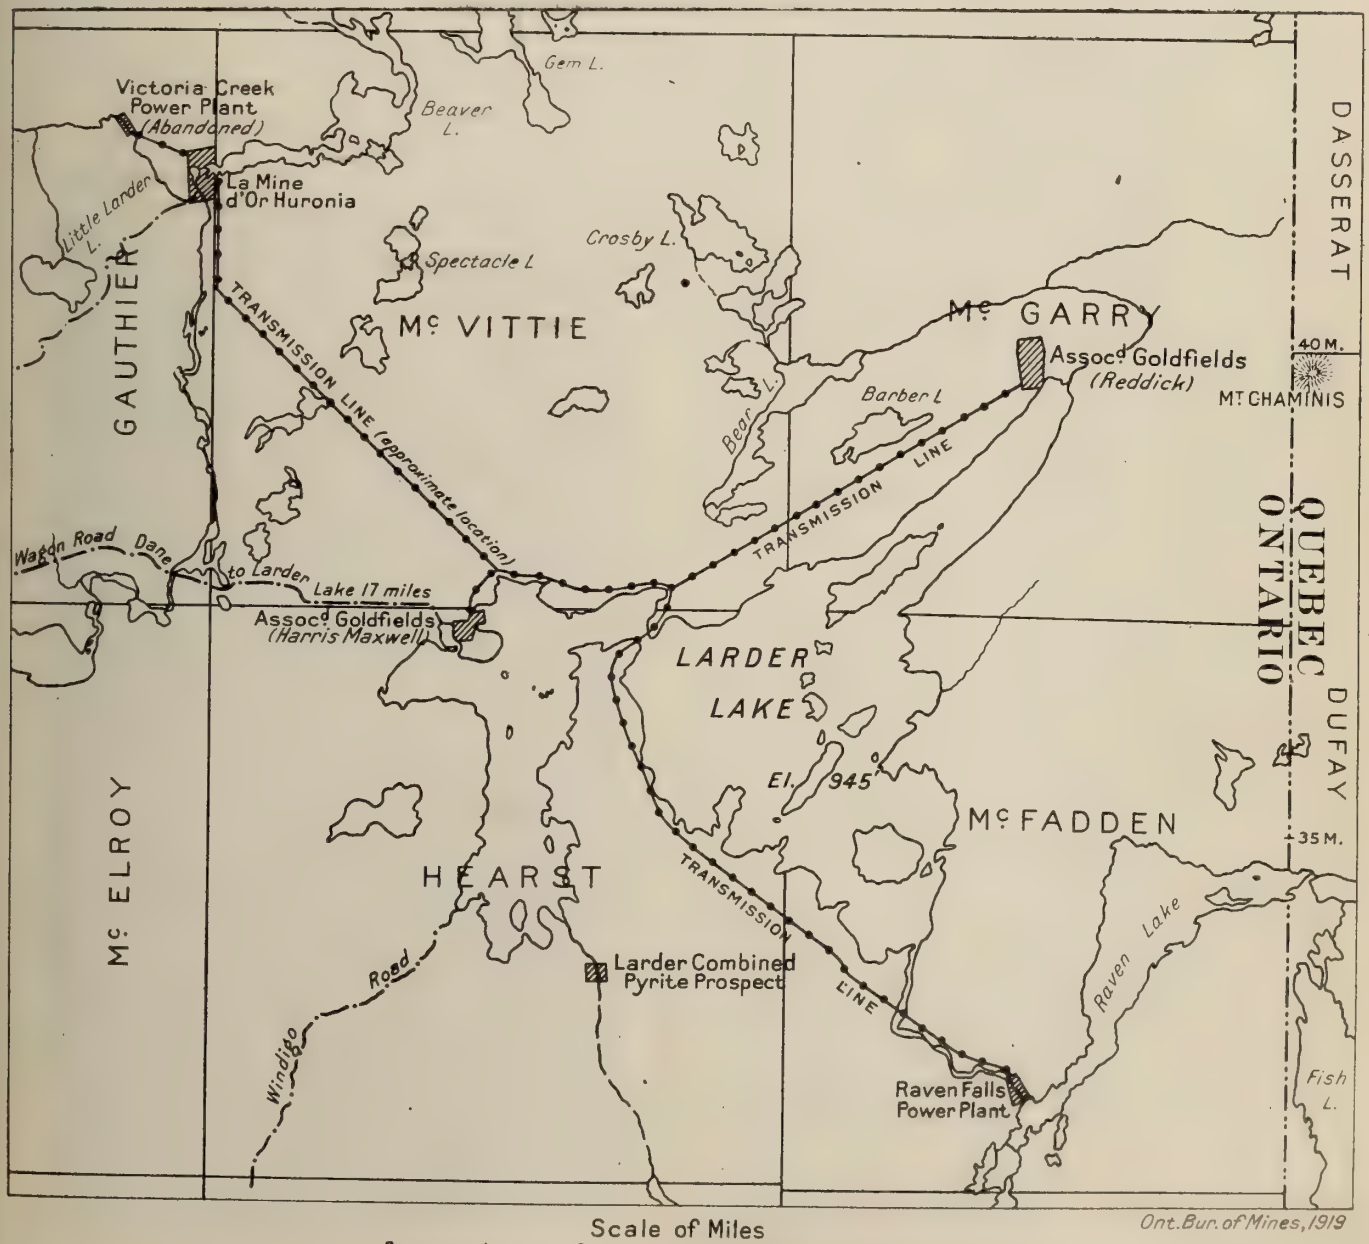
By N. C. PEARCE.

Going forward at Larder Lake is one of the really interesting mining enterprises of Northern Ontario. The program, now being worked out on the properties, calls for the development, the mining, and the milling of huge tonnages of low grade ore. The ore is of a character that has given rise to many opinions of its worth. The mining according to program, will be of the open-cut sort on ore bodies, 300 feet and more in width. The milling, if it is to have a success in keeping with the remainder of the ambitious plan, will be done in mills of capacity greater than anything in Northern Ontario, greater even than the units now being completed at the Hollinger, with their total of 3,500 tons daily. In fact, two mills, each of 5,000 tons, are talked of.

The company which has all these broad guage plans in hand, is the Associated Goldfields Mining Company. In the early stages before production. monetary strength of a company reflects confidence, and this company has $550,000 of confidence, cashed, in the banks. With that much to go on their enterprise can be discussed with a feeling that it will be carried well forward and that we shall see a good trial of the worth of the big low grade ore bodies which are being developed.

The results are bound to be of extreme interest all through Northern Ontario for other bodies, more or less similar in character although not in size, exist in other parts. Some of these, as the writer knows were staked first a dozen years ago, allowed to lapse, and restaked since, and perhaps some are again even.

The properties being worked by the Associated Goldfields—their total holdings in Larder Lake being 2000 acres—are the Harris-Maxwell, Reddick and Kerr-



The Larder Lake Area.

Addison. These names, particularly the first two, are well known to those who remember the boom in Larder that followed the early exciting years of Cobalt.

At the Harris-Maxwell the ore body on surface was opened up across a width of 130 feet. It may be wider there for water on one side and deep overburden on the other cut off further investigation. At the 500 feet level cross cuts of more than 300 feet have failed to find either wall. This body is known to be 1000 feet long.

The Kerr-Addison and Reddick properties, which adjoin, our ore body that at surface outcrops 300 feet in width, and is indicated by diamond drill to be 500 feet wide in places. This can be traced on surface over a length of 1200 feet, and a recent strike in the underground work on the Reddick would indicate that its length is at least 2000 feet. These figures tell of the enormous prospects providing the ore bodies are found to contain commercial ore throughout their length and breadth.

In general, the geology of Larder Lake is similar to the pre-Cambrian in many other parts of the north country. The oldest rocks are dominantly volcanics, comprising green stones and green schists. Associated with them are bands of ferruginous carbonate, iron formation, slate and conglomerate, which strike nearly east and west and dip vertically.

The rusty-weathering carbonate rocks at Larder are inter-sected by quart and calcite stringers. This type of material can be found in or near many of the gold areas of Northern Ontario, but at Larder it is found to carry considerably more gold than is usually contained. The carbonates are, on the Associated Goldfields properties, dolomites, occurring in bands of the widths mentioned. Usually brown in color, often large parts of them have been altered to green fuchsite or mariposite, serpentine and talc. A complicated network of quartz stringers is the gold carrier. In places the gold is quite coarse, but it is usually so finely disseminated as to be discoverable only by assay.

The point many examiners of these dolomite bands have labored to prove is that very careful sampling, in fine detail, will have to be done to determine which of these quartz stringers (sometimes four feet wide) or ore shoots (where they are thickly matted) are worth treatment. What the Associated engineers believe is that the quartz is sufficiently wealthy to make mining and milling of the whole material a profitable undertaking. Sampling to date has not caused the engineers to swerve from this idea, and now further sampling over entire widths is being done. In the final analysis, an extensive mill run can be the only decisive test.

The Harris-Maxwell property consists of two claims on the northwest shore of Larder Lake. Here the main camps and offices of the company are located. Communication with the other working properties, which are nine miles down the lake to the east, is made in summer by launch and in winter over the ice. At present the men are housed in bits of cabins, and they eat in a large marquee. Sleeping and cook camps for a staff of 200 are under erection and should be completed by the end of September. Living conditions then will be much improved and it will be possible to attract a full working crew. As it is now, the company employs far more men than any other developing mine in Northern Ontario.

The workings at the Harris-Maxwell are confined to crosscutting and drifting at the 500 foot level, where in all about 1200 feet of work has been done. Stations were cut in the shaft at each 100 feet. The openings are all in silicified dolomite. To a depth of 440 feet the workings are largely in grey dolomite while below this the rock is quite green, being rich in fuchsite, and cut by quartz stringers which carry much tourmaline and pyrite. Quite coarse gold can be seen in several places, and it is often accompanied by the fine galena.

At the 500 foot level considerable faulting is to be observed, also a change in places back to grey dolomite from the green. The management make the statement that the ore body should produce millheads of at least $5 a ton.

On the Kerr-Addison property, which many observers, lay and professional, will think is the prettiest looking of the set, the only work of consequence done is diamond drilling. A little trucking on surface, and a short tunnel near it, can be seen of the work performed in the early days. In these old workings a careless examination reveals free gold, and new shoots put in at random or surface will also expose very handsome showings. In appearance the ore body certainly would seem to have some exceptionally rich spots. About 2000 feet of diamond drilling have been done and the major part of a 10,000 foot order will be expended on this property.

The drill holes are set in to cross at an angle of 45

C. DAIMPRE,
Manager of the Associated Goldfields Properties.

or 50 degrees first from one wall, then from the other. The first hole showed the dolomite band to be 300 feet wide, and a later hole, further along, had it at that place 500 feet wide. The body held its characteristics throughout. An interesting appearance, under surface, was a broad tongue of porphyry. No assays have yet been made of the cores.

Adjoining the Kerr-Addison, on the strike of its big ore body, is the Reddick property of the Associated Goldfields. This is the pioneer property of Larder Lake. It is the first on which gold was discovered, and also makes a bid for fame because of producing the material for the first gold coins minted in Canada.

The work at the Reddick is confined to the 100 foot level, and totals about 1200 feet of drifting and cross-cutting. About half of this was done by former owners, and was not especially expert. The later work has been more objective and resultful. The rocks consist of alternating bands of dolomite and green schists. Two ore bodies, one 50 feet, the other 10 to 40 feet, in width, have been explored. The values are reported to run $10 to $12 the ton.

In August, in a cross-cut to the north, ore closely resembling that on the Kerr-Addison was struck. The last information was that this cross-cut was 75 feet into the ore body and that the condition pertaining to the second round of shots, when free gold was brought out, had continued with every round. In the west drift, which had been following a 50 foot vein, the color and character of the ore changed last month, and as it was known to angle toward this place it is quite possible that the Kerr-Addison body has been picked up here also. The writer saw some of the ore from the later faces (the drift now being 50 feet into the new ore) and it is remarkably prolific as to coarse gold and general mineralization.

The great point is: what measure of success will the Associated engineers have in taking these ores bodies as a whole and milling them. Those who read reports a year old, or who have not visited the properties, may shake their heads wonderingly. But on the properties the observer sees so much coarse "sweetness" scattered through the quartz, sees the stringers matted in a tangled network of quartz and dolomitic material, that he quickly takes in some of the confidence and assurance of those who are footing the bills and adventuring in an enterprise whose rewards, to success, must be extremely high.

Cheap hydro power for "glory holing" mining methods abounds. The company has its own plant on Raven Falls, on the river which flows out of Larder Lake. The plan is to mine the bodies by electric shovels and run the ore to the mills, down inclines, by electric trams. It is an extremely cheap method, this form of open cutting.

As part of its activities the Associated keeps going a small lumber mill, which has cut all the lumber for the camps and mine buildings, and is now cutting material for mill buildings.

Not a handicap, but assuredly a great difficulty to be overcome, is the condition of the road from Dane, on the T. & N. O. Railway, to Larder Lake. Some work was done on it during the summer but that work consists largely of scraping the road-bed into a loose mass and then putting it back and patting it down smooth. The autumn rains have played havoc with it already and it is, if possible, worse than before.

Other interests are working in the Larder Lake district, notably Nipissing, Crown Reserve, and other silver companies, and the old La Mine D'Or Huronia is being put into shape for a resumption of milling within a few weeks. But this article was intended only to take up the "glory hole" plans for the three leading properties.

A. I. M. & M. E. MEETING, SEPT. 22nd AT CHICAGO.

Practically every subject of importance to the American mining world will be discussed at the 120th. meeting of the American Institute of Mining and Metallurgical engineers, which convenes here for a five-day session on September 22nd. This is the 120th. meeting of the Institute and the attendance will include all those prominent in mining, United States Government officials and leaders of industry.

The fact that mine taxation, conservation of coal and new developments in the measurement of high temperatures are subjects to be thoroughly discussed at this meeting has excited great interest among mining engineers. On account of the number of subjects to be presented, a good part of the five days is given up to technical work from which it is expected that there will be developments of considerable moment.

The Institute will take a number of special trips to points near Chicago, including a steamer trip to Gary, Indiana, and rail trips to North Chicago and Milwaukee and nearby coal fields.

It has just been announced by the Institute that Charles M. Schwab will be in attendance and will address the Institute at a banquet on Wednesday evening, September 24th.

The principal session on the opening day will deal with mine taxation ond representatives of the U. S. Treasury will be present to participate in the discussion and to gain the cooperative opinions of the mine owners and engineers. During the day technical sessions will take up non-ferrous metallurgy and metallography; coal and gas; milling; industrial organization and geology. In the evening there will be a smoker at the Chicago University Club.

On the second, September 23rd. the Institute will take an excursion by boat to the plant of the United States Steel Corporation at Gary, Indiana, with technical sessions en route on the subject of iron and steel. in the evening, sessions on oil and iron and stel will be held.

On the third day, September 24th. several hours in the morning and afternoon will be given over to conferences on sulphur in coal, iron and steel and mining and local resources. In the evening President Horace V. Winchell of Minneapolis will hold a reception at Congress Hotel, to be followed by a banquet and dancing.

On Thursday, the interest of the Convention will be centred on pyrometry, a study of high temperatures, and some of the members will take an all-day excursion to the La Salle District to view the coal fields, cement manufacturing, three big zinc works and other industrial developments related to mining.

The Weekly Bulletin of the Department of Trade & Commerce states that a Sheffield (England) importer desires Canadian quotations on cobalt, nickel and ferro-alloys.

Ontario's Metalliferous Production, First Half-Year, 1919

Department of Mines Report.

Returns received by the Ontario Bureau of Mines for the six months ending June 30th, 1919, are tabulated below, and for purposes of comparison the quantities and values are given for the corresponding period in 1918.

PRODUCT.		Quantity.		Values.	
		1918	1919	1918	1919
Gold	ounces	229,421	231,729	4,648,164	4,666,759
Silver	"	8,736,002	5,744,172	8,267,624	5,951,362
Platinum	"		13.6		818
Palladium	"		16.4		987
Cobalt (metallic)	lbs.	118,889	59,337	249,045	93,157
Nickel (metallic)	"	208,802	5,147,745	83,332	1,825,347
Nickel Oxide	"	21,768	5,503	5,551	1,567
Cobalt Oxide	"	259,371	202,912	339,052	301,791
Cobalt Sulphate & Hydroxide	"	222,039	26,289	27,505	16,164
Nickel Sulphate & Carbonate	"		133,732		15,531
Molybdenite, concentrates	"	32,656		45,845	
Lead (pig)	"	776,711	1,481,204	66,630	54,802
Copper (blister)	"		3,080,492		452,055
Nickel in matte (*)	short tons	21,393	7,072	12,385,950	3,535,915
Copper in matte (*)	" "	10,708	4,341	4,283,040	1,128,753
Copper ore	" "	16		318	
Iron Ore, exported (†)	" "	30,741	5,804,	138,018	44,309
Iron, pig (x)	" "	38,130	24,095	1,034,517	670,512
Total				31,574,591	18,759,829

* Copper in matte was valued at 20 cents and nickel at 30 cents per pound in 1918. For 1919 the values have been placed at 13 and 25 cents per pound respectively. The total matte produced contained 10,605 tons of nickel and 5,911 tons of copper. See heading "Nickel-Copper" for explanation.

† Total output of iron ore was 70,955 short tons worth $307,645.

x Total output of pig iron was 305,577 tons valued at $8,503,644. Figures in the table represent proportional product from Ontario ore.

General Remarks.

As a result of after-war conditions there was a material reduction in Ontario's metalliferous production for the first six months of 1919 as compared with the corresponding period of 1918. This is due chiefly to the curtailed production of nickel-copper matte to about half that of 1918, when there was the greatest production of these metals that this Province has ever known. The silver output continues its natural decline, although the price of the metal has been rising steadily. Gold, however, shows a slight increase over both the 1917 and 1918 production. Molybdenite, for lack of a market, is not being mined. The precious metals, platinum and palladium, are now recovered at the Port Colborne refinery of the International Nickel Company of Canada, Ltd. Lead along with most other metals has fallen in price since the close of the war.

Gold, Platinum and Palladium.

Gold production, 231,729 ounces, shows an increase but is still a little under the figures for the first half of 1916, when 235,060 ounces were recovered. Unfortunately the strike at the Kirkland Lake camp, which began on June 12th, is still effective, and that source of gold supply is shut off for the time being. At Porcupine, however, the output is increasing, more particularly at the Hollinger, Dome, and McIntyre mines. During the half year 490,523 tons of ore were milled, of which 465,407 were treated at Porcupine and 25,116 tons at Kirkland Lake for a recovery of 212,895 and 18,637 ounces respectively. As a by-product of nickel-copper refining at Port Colborne gold to the value of $3,921, also platinum and palladium in small quantities as shown in the table of production, were recovered.

Silver.

Despite the high price of silver, which averaged 103,677 cents per ounce for the half year, production from Cobalt declined nearly three million ounces as compared with 1918. There were 28 properties from which shipments were made; those marketing one-quarter million ounces or over are named in descending order: Nipissing, Mining Corporation of Canada, McKinley-Darragh-Savage, Kerr Lake, Miller Lake-O'Brien, Coniagas, O'Brien and Buffalo. On July 23rd a strike was called by the Miners' Union. A settlement in the near future is probable as representatives of both miners and managers are meeting in conference. Even with an early resumption of work

the year's output will be materially reduced by the strike. Of the total output 42,900 ounces were recovered from gold ores and 11,714 ounces from the refining of nickel-copper matte. The Miller Lake-O'Brien and Crews-McFarlan mines at Gowganda contributed 409,344 ounces of the total, the balance coming from Cobalt proper and Casey township. Seven shippers were paid for the Cobalt content of the silver ore, receiving therefore $16,737. The ore testing and sampling plant at Cobalt, formerly operated by Campbell & Deyell, was purchased by the Ontario Government on May 8th, and since that date has been under the management of A. A. Cole, Mining Engineer of the T. & N. O. Ry. Commission.

Silver-Cobalt Refineries.

In addition to metallic cobalt and nickel and various compounds of these metals, as noted in the table, Southern Ontario refineries recovered 2, 659,569 ounces of silver and marketed 1,949,280 pounds of white arsenic. This production came from plants located at Deloro, Thorold, Welland and Chippawa. Nickel metal from these refineries to the extent of 106,023 pounds was marketed for $37,119.

Nickel-Copper.

Since July 1918, when the production of refined nickel and blister copper by the International Nickel Company of Canada, Limited, began at Port Colborne, Ont., the total quantities of nickel and copper in matte do not appear in the table production. The figures given represent the shipments of matte to the United States and Wales. The close of the war found the nickel companies over-stocked, and consequently the price fell and production was curtailed. Until the surplus stock has been absorbed nickel-copper matte production will not increase even to a pre-war basis. Ore smelted in the period totalled 370,541 tons as compared with 717,119 tons for the corresponding period in 1918. Ore shipped from the Alexo mine to the Mond Company smelter was 2,215 tons and the British America Nickel Corporation on June 30th had 46,814 tons stock-piled.

Iron-Ore and Pig-Iron.

Of the total output of iron ore 65,151 tons went to Ontario blast furnaces, and 5,804 tons were shipped out of the Province. The Magpie and Moose Mountain mines were the chief producers.

Four iron furnaces at Sault Ste. Marie, two at Hamilton and one each at Midland, Parry Sound, Port Colborne and Deseronto were in blast. Foreign ore smelted in the period was 598,581 tons and Ontario ore 31,238 tons. The total output of pig-iron was 303,577 tons worth $8,503,644; steel 296,081 tons worth $8,770,717 and 23,955 tons of spiegel valued at $868,-148. The Algoma Steel Corporation now makes in its own ovens all the coke required in its plant, the output being 183,970 tons for the period.

Nova Scotia Notes

Coal Export Business Developing.

Some indications of a return to pre-war operating conditions are shown by recent news from the collieries in Nova Scotia.

An export trade in coal is being done, which is understood to consist largely of coal delivered to vessels calling for cargo. There have been newspapers reports of large contracts made with European buyers, but so far the bulk of the new business has been done in the supplying of cargo to foreign owned vessels that have been compelled to come to this side for coal because of the European shortage.

In this connection shipping is a more important consideration than the coal supply itself, and there is an unlimited market in Europe at the present time, and for an indefinite period to come, open to Canadian coal companies that possess vessels free to trade to Europe. The Nova Scotia Steel Company is understood to be taking advantage of the opening, having put the S.S. "Wascana" into the coal trade, together with another freighter the operation in which was obtained by the purchase of the coal-shipping plant of the Imperial Ministry of Shipping at the Terminal Wharf in Halifax.

The Scotia Company have sold a number of cargoes for Italian and French destinations.

The Dominion Coal Company are also obtaining considerable export business for Holland delivery and for Scandinavian ports. It may be taken for granted that the Nova Scotia companies have absolutely no intention of relinquishing the business in the Montreal market which they have been at such pains for so many years to cultivate, and a larger quantity will be delivered in the Montreal district before the ice forms than has been sent up the River since the 1915 season, but at the present time, if freights are obtainable, the European market offers more profitable sale and it will be surprising if the Nova Scotian operators do not take full advantage of it.

Colliery Extensions.

Another encouraging sign is the commencement of development work, after an almost complete cessation for five or six years. If development work had been much longer delayed, the aspect of the future of the Nova Scotia coal industry would be worse than it is, and even with new extensions and developments pushed to the utmost during the next five to ten years, it will not be found possible to make up the leeway that has resulted from the complete discontinuance of new developments during the war period.

Dominion Coal Company.

It is understood that the Dominion Coal Company are re-opening the No. 17 Colliery—more familiarly known as the Old Victoria Mine. This is one of the collieries that was acquired by the Dominion Company when it was incorporated. Along with the Gardiner Mines and others it was closed down when the Company developed its policy of working only the Phalen seam collieries concentrated in the district of Glace Bay. Just previous to the war, the mine was pumped out, and the main haulage way was re-timbered and some development work done at the foot of the deeps. An extensive surface layout was planned, and a few buildings were erected, but when the needs of the army commenced to shorten the available labour supply, the extension work was discontinued, and only sufficient force was kept at work to maintain the mine in order and to keep it ventilated and pumped out.

The production of No. 17 was brought up to about 2,000 tons monthly just previous to the outbreak of war, and it will not be possible to increase the output beyond a few hundred tons daily until the surface equipment is installed. The lower workings of this colliery are dipping quite steeply, between 30 and 40 degrees, and the conditions of operation will be found probably more difficult than in any of the other collieries of the Dominion Company.

The coal is of excellent quality, and in the days when the mine was independently operated, "Victoria Mines" coal had a wide reputation.

A large colliery village had been erected before the war, and is available to house any new workers obtained. The houses are of modern design, well spaced and most healthily situated, the surrounding country being a pastoral and long-settled farming district.

The Dominion Coal Company is also making preliminary investigations, of a prospecting and testing nature, to determine the advisability of re-opening the Gardiner Seam. This is a seam of good quality, about 4′ 6″ in thickness, well adapted for longwall operation. It underlies the whole land and submarine areas of the Dominion Company in the Glace Bay District, and has mined only to a very small extent. This is one of the seams that was reserved for future development when the Dominion Company in 1893, as previously mentioned, concentrated its operations on the thicker and more accessible seams on its properties.

The Dominion Coal Company also controls the properties of the North Atlantic Collieries at Port Morien, where there is a very large submarine area of coal awaiting future development. This submarine area may in years to come assume importance second only to the submarine tract off Glace Bay and Waterford.

As previously mentioned, the Dominion Company are also sinking a new shaft to the Phalen Seam near No. 2 Colliery, and are understood to contemplate a second new shaft to develop the submarine area off Glace Bay tributary to the Caledonia Colliery area.

Nova Scotia Steel and Coal Company.

The Scotia Company is testing the Stubbert seam near Point Aconi, but nothing beyond a preliminary operation is as yet contemplated.

It is also reported that the Scotia Company intend to erect a by-product coking plant at Sydney Mines, and to further develop the system of electrical operation of its collieries by the power derived from waste gases which it has followed for a good many years. While it is known the Scotia Company have for some time been studying plans for such a coking plant, no official confirmation of the report has been announced, and it may therefore be presumed that future plans are as yet only in a formative stage.

The coal production of the Scotia Company has shown a marked improvement of late. An aggressive policy is being pursued by the management. A good many additions to the official staff of the Company have recently been made, and the collieries are working practically full time. The production of the Florence Colliery has in particular been increased.

THE HUNTINGDON MINE.

..Mr. F. M. Connell has returned to Toronto after being for some time at the Huntingdon copper mine at Eastman, Quebec. He reports that very satisfactory results are being obtained. Shipments of concentrate are being made regularly. A first class compressor which had been installed during the war on a chromite property near St. Cyr has been purchased by Mr. Connell's company, the Eastman Mning & Milling Co. Ltd., and will be installed at the Huntingdon.

CANADIAN COAL MEN.

Alexander Mc. Eachren, and Alexander MacDonald, Asst. General Superintendents of the Dominion Coal Company.

The operating officials of the Dominion Coal Company have usually been selected from amongst the employees of that Company, who in turn have been, and are still very largely, recruited from amongst the descendants of Scotch Highlanders who settled in Cape Breton Island, and have left an indelible impress on the place-names of the Island and the racial characteristics of its population.

At one time, almost without a single exception, the mine managers and superintendents of the Dominion Coal Company were born in Cape Breton Island, or at any rate not outside of Nova Scotia, and boasted the hereditary prefix "Mac" as part of their names.

The skill of these men as coal-miners was in the first instance inherited from their fathers, and perfected by early acquaintance with the "coal-face". No better examples of practical miners are to be found that these same Nova Scotians, who have made their mark, not only in New Scotland itself, but in every mining camp of this Continent, from Mexico to the Yukon. The gold nugget worn as a personal souvenir, with the blue scars of coal-dust in old cuts and abrasions, added to other signs that the initiated may recognise in the free masonry of the miner, tell the history of some Nova Scotia's wandering sons, who, by the way, wandered in just the same old way, and with the same old spirit into the fighting in France, and left their marks on "Fritz" for a change.

That, however is another story, which someone may someday gain fame by relating, for the story is one that will bear embellishment.

ALEXANDER McEACHREN.

Among the sons of Cape Breton who made their mark at home, being both beyond the military age but not nevertheless of pacifist disposition — at least not remarkably so — are Alexander MacDonald and Alexander McEachern, in the differing spelling of whose paternal prefix there is written much history.

Alexander McEachren has filled every capacity in the employment list of a colliery, having commenced as a trapper boy and risen through successive grades to the position of Assistant General Superintendent of the Dominion Coal Company. He has taken a leading part in the mining schools of Cape Breton, having assisted both as teacher and by his personal interest and influence to make this form of instruction as adequate as the appropriation of the Local Government will allow. Mr. Mc. Eachren has always been a student of mine safety, and in this respect has kept well in advance of his times.

He is a member of the Standing Examination Committee of the Province for the granting of certificates of competency, and a Councillor of the Mining Society of Nova Scotia. Previous to being appointed to his present position, Mr. McEachren was for eight to nine years Superintendent of the Waterford district of the Dominion Collieries, which includes the Collieries Nos. 12, 14, 15, 16 and 17.

Alexander MacDonald, likewise, has had a life-long experience in the Cape Breton collieries, and previous to being appointed to his present office was for nine years a Superintendent of No. 3 District, and before that was Manager of Caledonia Colliery for about nine years.

Both the subjects of this sketch have had experience in the harder tasks of a colliery official's life, having been intimately concerned with mine fires and explossions, and were it not that we defer to the general objection of conscientious mine officials to public announcement of their virtues, we could say many things that would sound like flattery, but would be merely a plain recital of incidents that are part of the ordinary duties of the responsible colliery official, and which the profession does not advertise.

The "twa Sandies" of our text are bound for the "top level" by different routes, but the writer imagines that before the Great Assize they will both obtain certificates of competency. At least he would not mind taking a chance with either for company.

ALEXANDER MacDONALD.

FIRST INTERNATIONAL MINE-RESCUE AND FIRST AID MEET IN THE PACIFIC NORTH WEST

(Reported by our Special Correspondent.)

An international competition in Mine Rescue and First Aid Work took place on Labor Day, the 1st. of September, under the auspices of the Vancouver Island Mine Safety Association, at Nanaimo, B. C. As it was the first held in Western Canada to be attended by representatives of the coal mining districts of the States of Washington and the first for a number of years to bring teams from the Crow's Nest Pass Coal Field, Eastern British Columbia, the event attracted unusual attention and the added interest stimulated those entering to special training. The result, it is admitted frankly, was a disappointment to the Canadians. The men from the Pacific Coast Coal Company won the British Columbia Championship Shield and second place was taken by the team representing the Roslyn Fuel Company. Consequently the trophy has left the Province for the first time. It must not be supposed that the British Columbians were anything but good losers. They congratulated the victors spontaneously and warmly, their sentiments being well expressed by Hon. Sloan, Minister of Mines, when, in the course of the presentation of the prizes, he said that, while the visitors unquestionably had won on their merits and so were entitled to the hearty congratulations of which they had been the recipients, they would find the Canadians back next year determined to reverse the present decision.

There were nine teams entered. Besides the two from Washington State the Canadian Western Fuel Company, of Nanaimo, B.C., had three, the Crow's Nest Pass Coal Company, Fernie, B. C., one; the Granby Company's Collieries, Cassidy's, one; and the Canadian Collieries (D) Ltd., two; one from the Extension and the other from the Cumberland mines. Of these the Cumberland team only was equipped with the Draeger Apparatus. Those from the Roslyn Company and from the Canadian Collieries (D) Ltd. (Extension) used the Paul while the remaining six teams were provided with the Gibbs. The usual boarded structure represented the mine and the problem, which was not varied, was that an explosion had occurred and the miner to be rescued had barricaded himself in against the gas, the ventilation, of course, having been cut off. It was simply stated that the said miner was alive, nothing being given as to whether he was injured or overcome. For this reason it is interesting comment that all the teams bore the patient from the mine on a stretcher, none taking advantage of the opportunity

to merely walk him through the bad air to the surface with a breathing machine as protection. The judges were James Bagley, State Mines Inspector for Washington; R. Schonning, manager of the United States Bureau of Mines Staff, Washington State; George Wilkinson, Chief Inspector of Mines for British Columbia; and Dudley Michel, Instructor in First Aid and Mine Rescue Work for the Provincial Department of Mines.

An analysis of the marking of the judges is illuminating because it shows that the competition was won and lost, not in actual mine rescue work but on the testing benches where the judges, Messrs. Michel and Schonning, presided and where the apparatus of the contesting teams was subjected to a rigorous test prior to being buckled on the men. The Fernie Team was the first to go through. They had no trouble with the Gibbs machines, escaping without a deduction because of "loose joints or connections." In mine work, however, thirty-six points were lost. A leak cost the Roslyn Team, ten points, while twenty-four were dropped in the mine. The Pacific Coast Coal Company's Team, Black Diamond, winners of the Shield and Championship, were penalized ten points for a leaky point or connection and fifteen for their performance in the mine. Laird's Team, of the Western Fuel Company, lost sixty points for leaks in apparatus and five in mine work. The Extension Team dropped ninety points for leaks in apparatus and forty-five for their work in the mine. The remainder may be summarized as follows:—

	Loose Joint or Connection.	Mine Work
No. 2 Team, Western Fuel Co., Nanaimo	30	40
Cumberland Team, Canadian Collieries (D) Ltd.	70	35
Granby Collieries (Cassidy's)	100	49
No. 3 Team, Western Fuel Co., Nanaimo	30	20

It will be seen from the above that there were two teams which stood, in actual performance in the mine, head and shoulders above the others, viz., that the Pacific Coast Coal Co., Black Diamond, and No. 1 (Laird's) Team of the Western Fuel Company, Nanaimo, B. C. Although, as stated at the outset, the Canadians are not disposed to withold any of the credit due those who came from the other side and took the honors they, quite naturally, feel that it is rather too bad that the decision should have gone against them solely because of minor leaks in apparatus, located through the severe tests of soap suds and penalized, when found, to the maximum extent. Mr. Laird and his men point out, too, that the apparatus which they used had previously been through the test, in the hands of the Fernie team, without a leak being found and that that experience no doubt accounted for what looseness subsequently developed. Of this there cannot be any doubt: that the Black Diamond and the Nanaimo Teams were the best in actual mine rescue work on their showings in the competitions under review and that the Laird Team, apart from the discrepancy found in their apparatus, must be congratulated on their performance in the mine. They did so well that it has been suggested that they should be sent to Pittsburg for the forthcoming international meet. In passing it may be observed that the "soap sud" test no doubt was the result of the very keen competition between the Gibbs and the Paul apparatus and their representatives on the Pacific Coast. The former was represented by H. H. Sanderson, the western manager of the Mine Safety Appliance Co., and George Riggs, the factory expert; and the latter by A. G. Menny, of the American Atmos Corporation.

Other prominent coal mining men who watched the contests with interest were Stephen H. Green, manager of the Pacific Coast Coal Co.; Harry Freeman, superintendent for the same company at Black Diamond; Wm. Shaw, superintendent of the Roslyn Fuel Company; Thomas Graham, General Superintendent of the Canadian Collieries (D) Ltd; J. J. Grant, manager of the Nanoose Collieries Ltd.; John Hunt, superintendent of the Canadian Western Fuel Co.; and officials of the B. C. Department of Mines. Among the guests of honor was Hon. Wm. Sloan, Minister of Mines, through whose influence as a member of the government a substantial grant had been obtained to defray the expenses of the event. Mr. Green, of the Pacific Coast Coal Co., was delighted with the success of his men and has no hesitation in predicting that they may be depended upon to bring honor to the west at Pittsburg.

In the First Aid Competitions the honors were fairly evenly divided, the results being as follows:—

Department of Mines Cup: I. J. W. Jemson's Team, Nanaimo, B. C.; 2, George Carson's Team, Nanaimo, B. C.

One Man Event: I. J. S. Murphy, Pacific Coast Coal Co., and Julius Tonda, patient; 2, R. Charnock, Nanaimo, and J. McCourt, patient.

W. L. Coulson Cup: 1, Jeo Barton's Team, Nanaimo, B. C.; 2, J. Brown's Team, Nanaimo.

Juvenile Cup, open for annual competition and offered by the Vancouver Island Mine Safety Association: 1, Ladysmith, R. Ferguson, captain; 2, Nanaimo, R. Jackson, captain.

Two Men Event: 1, Nanaimo, A. McNeill, captian; 2, Roslyn Fuel Company.

Open Event, (open to all working miners): 1, Nanaimo, Joe Barton, captain; 2, Nanaimo, A. McNeill, captain.

Mr. Sloan, in an address delivered in connection with the prize distribution, stated that as long as he held office he would do his utmost to assist mine safety competitions, believing them to be important in advancing the welfare of the coal miners. He was proud to have been identified with the first international Meet of the kind in the Pacific Northwest.

Special Correspondence

BRITISH COLUMBIA.

Slocan, B.C.

The first shipment this season from the Black Prince Mine, situated on the divide between Lemon and Springer Creeks, has been sent to the Consolidated Mining & Smelting Co.'s smelter at Trail, B.C. This is a silver-lead property of promise. The Black Prince has been developed to some extent and in the process has passed through the hands of a number of operators. J. E. Tipping, the present owner, has been in possession for the past four years and the best car of ore taken from the mine was shipped by him. The average return in this case was about 200 ounces of silver to the ton.

Nelson, B.C.

Reports reaching here are to the effect that work is proceeding on the Lucky Boy and the Security Mines of the Erie District which, together with the Second Relief Property, suffered by fire on the 16th of July last. S. L. Myers, superintendent of the two former properties, is engaged in getting out timber for a new bunkhouse and for other buildings. In the meantime Mr. Myers is camping in the tunnel of the Lucky Boy.

There is considerable activity at the Eureka Mine, Eagle Creek. W. M. Myers, the superintendent, is surveying preparatory to the installation of a new aerial tramway from the upper terminal of the Granite-Poorman Mine tramway to the lower adit of the Eureka workings, which will be about 3,000 feet in length. The Granite-Poorman Mine tramway, running between the mill and Granite siding, a distance of 3,000 feet, is being dismantled and the material will be put in the new line. The tramway being removed was utilized originally to facilitate shipment to the smelter. The Granite mill is running steadily on two shifts, handling ore from the upper levels of the Eureka. A crosscut is being driven on the latter property which will give 450 feet depth on the vein. There have been a number of visitors to the Eureka from Walla Walla recently, among whom were Mr. and Mrs. C. E. Nye, the former being the president of the Inland Mining Company, which is responsible for the work outlined.

J. W. Evans, manager of the Mountain Chief Mining Company, announces that a shipment of 200 tons is being made to the Consolidated Mining & Smelting Co.'s smelter at Trail, B.C., this being the first ore to go from this copper property under its present management. Development has been underway since last February. The ore body, which at first was chalcopyrite, acquired a substantial percentage of bornite as the shaft made depth. It now is being developed by a lateral drift, which was started at a depth of 60 feet, with a face of 9 feet. The general character of the ore is being maintained.

Lardeau, B.C.

Antimonial lead ore is said to have been struck on the E and M claim, Cascade Creek, Lardeau District. The vein averages six feet in width and carries a sixteen inch streak of dense sulphide that is reported to assay 21.5 per cent lead and 7.4 ounces of silver per ton. The ore was found while sinking for a rich silver vein that was worked two years ago.

The Panama, a dry-silver property situated at Bear Lake, Lardeau District, has been re-opened after an idleness of 18 months by H. Giegerich, of Kaslo, B.C. A long drift on the ledge, which is designed to get under the showings above, is being continued. The tunnel now is in a distance of 370 feet and it is estimated that it still has about 200 feet to go to reach the ore body. The Panama is opposite the Lucky Jim Zinc property. It was owned for fifteen years by the late J. P. Miller and Giegerich and, on the former's death, passed to the latter, who now is the sole owner.

Sandon, B.C.

Work on the Ruth Mine at Sandon, B.C., which has been prosecuted on the lower or mill level, has resulted in cutting the veins about 600 feet from the portal of the tunnel. At that point the vein is about eight feet wide and there is every indication that further development will show up a good ore body.

Edgewood, B.C.

A quantity of rich ore was uncovered in the course of the performance of assessment work on the claim of W. J. Banting, Lightning Peak. It is expected that active development will result. The outcome was a rush to the district by prospectors and the staking of all ground adjacent to the Banting claim. It is reported that on the Waterloo Mineral claim rich carbonates, running from 4,000 to 9,000 ounces of silver to the ton, have been discovered and that the owners have about a ton of it ready for shipment.

Salmon River, B.C.

The operators of the Premier Mine, Salmon River, propose to experiment with a motor-sled to transport ore over the snow during the coming winter.

Dawson, Y.T.

It is estimated that the total gold output of the placer camps of the Yukon Territory and of Alaska will be $5,250,000. To this may be added half a million dollars if the districts of Atlin, Northern British Columbia and of Nome, Alaskan Coast, are included, each of these sections being given credit for a quarter of a million. This computation is up to the close of navigation which will take place next month. Another half a million may be yielded by other scattered camps throughout the north so that it is possible that the aggregate will reach $6,250,000 for the year 1919. All northern camps are led by the Klondyke, with Dawson as the center, its season production being placed at $2,000,000. Second place is taken by the Tanana Valley as Fairbanks, Talovana and the Hot Springs are credited with $1,500,000 or more. On his return from a tour of the posts controlled by the Northern Commercial Company, Volney Richmond, the company's superintendent, estimates the season's placer gold yield as follows: Dawson, $2,000,000; Fairbanks, $800,000; Iditarod, $750,000; Talovana, $700,000; Kuskokwim, $250,000; Circle, $225,000; Ruby, $125,000; Kuyukuk, $100,000; Marshall, $75,000; Hot Springs, $60,000; Ophir, $50,000; Rampart, $25,000; Chandlar, $20,000.

Vancouver, B.C.

On his return from a tour of Northern British Columbia, in the course of which he visited Alice Arm, Anyox, and other mining centres, Hon. Dr. King, Minister of Public Works, stated that he noted a marked increase in mining activity and that a spirit of optimism was apparent, which had been lacking in recent years. He inspected the Dolly Varden Mines and the railroad operating between tidewater at Alice Arm and the mines, a distance of eighteen miles, construction of which was authorized by the Provincial Government. Dr. King states that it is the intention of the Taylor Engineering Company to extend the road for four miles next year, thus affording transportation facilities to other properties now being developed and which are making excellent showings. There is promise of a large tonnage being offered the railroad and the management is anxious to handle as much as possible, not only that the mineral deposits of the country may be made to yield, but that the railroad may be made to pay running expenses.

Alice Arm, B.C.

When Hon. Dr. King visited this centre he met the members of the Alice Arm Commercial Club to discuss the report that the Taylor Mining Company had refused to accept freight for transportation by the Alice-Dolly Varden Railroad from any source save the Dolly Varden mines. A. J. T. Taylor, manager of the company, also was present. When asked whether the railway would be able to take ore from outside sources Mr. Taylor stated that much would depend on how the road and equipment stood up under the tests soon to be made, but if he could possibly see his way clear in the face of the many complications involved he certainly would help out prospective shippers to the limit of his ability.

Subsequently Mr. Taylor reported that the Dolly Varden Mines were making a daily production of 100 tons of good grade ore and that regular shipments were being made over the new road to tidewater and thence by boat to the Anyox smelter of the Granby Consolidated Mining & Smelting Company. This would continue as long as weather permitted. Under Majors Young and Davis, both mining men recently returned from overseas, splendid progress had been made at the mine. A steam compressor and a 2,000-foot aerial tramway were in operation and the whole property now was as fully equipped mechanically as the difficulty in obtaining machinery would permit. It had been necessary first to complete the railroad and the aerial tramway before opening the mine to any extent.

Discussing conditions in the Alice Arm District, Mr. Taylor said that more engineers and prospectors had gone into the country than during any five years preceding.

Cowichan, B.C.

The B.C. Manganese Co., Ltd., are making good progress in the development of their properties at Hill 60, some twelve miles west of Duncan. Two carloads of ore, containing fifty tons each, already have been shipped and it is expected that a carload will go forward every three or four days. In the first instance the ore was brought down the hill by teams. Subsequently, however, motor trucks were put on the work and the results are said to be satisfactory. In its initial stages the mining was of a quarrying nature. Recently however, a steam plant was installed and production has been materially increased.

Victoria, B.C.

After a two weeks' trip through the country of the Kokahala River, British Columbia, Charles Camsell, of the Dominion Geological Survey, has returned. He surveyed gold deposits along the line of the Kettle Valley Railway from Hope to Jessica, and reports having found some quartz veins rich in gold. The "Emancipation Mine," however, is the only lode being worked in the section and, although it contains high grade ore, it is being operated in a small way, this being due to the excessive cost of labor and machinery. The same veins, he said, run across the Fraser River above Yale and have been prospected to some extent. They have supplied in the slow process of erosion much of the gold which has been taken from the placers of the Fraser and other streams.

Grand Forks, B.C.

The Canadian Consolidated Mining & Smelting Company is installing three decrepitating furnaces and rotary kilns at the Rock Candy Fluorspar mine near Lynch Creek, near Grand Forks, B.C. Since the completion of the concentrator at the property early this year experiments have been in progress in the treatment of this ore and it is said that Supt. A. A. Robertson, who is in charge, has met with success with the decrepitating process, something new for this Province, and which generally speaking consists of the breaking of the ore by means of a decrepitating furnace and rotary kiln, crude oil being used as fuel. One unit of the process was first installed and the results being satisfactory it was decided to instal three more. When these are operating it is expected that the plant will handle about 100 tons daily and it is anticipated that the demand for fluorite assures the continuous operation of the mine and plant.

No Reason For Stampede in Koyukuk Region.

From Fairbanks comes the report the prospects uncovered on Bettles River last spring do not warrant a stampede to that district at this time. All the ground on the creek has been staked but there will probably be no more work done until next winter.

From all indications there is a good chance that the country will turn out all right, but it will have to be developed in the future as nothing definite in the way of pay has been lined up.

This is no time for a stampede as everything is staked now and if anything develops during the winter, lays can be secured next year. Men going to the Koyukuk should have $1,000 in cash or its equivalent in grub as it will take that amount to run them through the winter.

Good prospects are also reported recently on the Hog River. About thirty-five men are preparing to spend the winter on this river, which is 300 miles from the mouth of the Koyukuk. Old timers are convinced that something good will be found there next winter.

The Yukon.

News from Mayo states there has been a strike in that vicinity. This is supposed to be the new silver find on Lightening Creek made by Louis Bouvett.

No definite news has come out up to the present writing.

Rich Strike Reported From Taku.

Reports from Juneau are that there has been a rich strike in the Taku district. Inklin is the present head of transportation on the Taku River, and is about 75 miles from the Coast.

University of British Columbia Has Two New Professors.

The University of British Columbia has added two new professors to its force of instructors. Professor H. H. Thompson, Bachelor of Science from McGill University comes to the chair of Metallurgy. The larger portion of M. Thompson's time since leaving McGill has been taken up with professional work in Canada and the United States. He was chief Metallurgist for some large mineral interests in Arizona and Utah for some time. Mr. Thompson is a Canadian and his desire to return to Canada and educate his children here has influenced him to accept the professorship.

The other appointment is Mr. George A. Gillies, M. Sc., to be assistant professor in Mining. M. Gillies is also a McGill man, who has a great deal of experience with the mechanical branch of the mining industry.

NORTHERN ONTARIO

The Gold Mines.

Hollinger Mine.—Producing at a rate of well over $7,000,000 annually, and soon to increase this output to an average of perhaps $10,000,000 a year, the reducing plant of the Hollinger Consolidated Gold Mines represents one of the largest and most modern of its kind in existance. Certain additions being made to the plant will increase its capacity from about 2,800 tons to not far under 3,500 tons daily. The ore contains an average of over $6 to the ton and may be estimated to yield profit approximateing half that amount. The company is capitalized at $25,000,000. Producing at the rate of $10,000,000 a year and realizing a net profit of $5,000,000 a year it can be seen that dividends at the rate of about twenty per cent are indicated for the not far distant future. Even producing at such a rate there is already ore blocked out and in sight sufficient to keep the mill running at full capacity for over four years. In addition to this it is considered not improbable that the new ore developed from year to year may for some time exceed the amount taken out with the result that ore reserves should be maintained for several years ahead of production and for a good many years to come. It is the ambition of General-Manager A. F. Brigham to establish a five-year record that will surpass in volume any previous record set by any other gold mine in the world.

The next few months will see the completion of the construction work. The amount of money being spent on construction each year by the Hollinger is very considerable. This has been an important factor in adding to the operating costs. With this factor reduced to ordinary upkeep of the equipment, the reduction in costs should be considerable.

It is considered not improbable that during 1920 the higher degree of efficiency as a result of more satisfactory working forces, taken together with lower cost of supplies and the elimination of construction work, the average cost of production might reasonably be reduced perhaps as much as a dollar a ton as compared with the past year. Treating 3,000 tons daily or nearly 1,100,000 tons of ore annually, it can readily be seen that this saving would alone amount to over four per cent on the company's issued capital.

Estimates recently made as to the earning capacity of the Hollinger and which indicated about 18 to 20 per cent net profit appear to have failed to take the foregoing facts into consideration.

Dome Mine.—As near as can be ascertained the Dome Mines is now realizing a net profit at the rate of about thirty per cent on its issued capital. It is stated, as pointed out last week in these columns, that about 900 tons of ore was being treated daily and an output of about $250,000 being recorded monthly. Of this, it is estimated about fifty per cent. is net profit, or to be conservative about $100,000 should represent net profit.

Capitalized at 500,000 shares of the par value of $10 each and with only 400,000 shares or $4,000,000 issued, the Dome need only earn $66,600 net profits monthly to meet its former rate of dividends of 20 per cent. Provided the company is actually earning $100,000 net profit monthly, the return is equal to 30 per cent. on the company's issued capital.

This record is being achieved at a time when the mill is running at about 65 per cent capacity. In due course, when running at full blast, it is not unreasonable to anticipate an achievement bordering on the sensational. Even now it is evident that the percentage of net profit being realized on the Dome Mines is higher than any other gold mine in Canada. This is made possible due to the low capitalization, a condition which appears certain to shower exceptional advantages upon the holder of Dome shares.

McIntyre-Porcupine.—It is expected that the annual report of the McIntyre-Porcupine will be mailed almost immediately to the shareholders. The company's year ended June 30th. In order to comply with the law it is necessary that the report shall be issued within ninety days after the ending of the year. Thus, September 30th would be the last day. The current fiscal year of the company already shows signs of being the best in its history. It is expected that for the first time, the current year's output will exceed the two million dollar mark. Development work at depth continues exceedingly favorably according to reports just to hand.

Shareholders of the Plenaurum Mines, which is under option to the McIntyre-Porcupine Company, are evincing a good deal of uneasiness. To them, or at least to a good many of the minority holders, the terms of the agreement remain somewhat of a mystery.

Rumors are current to the effect that a change in terms is under contemplation. It will be recalled that last fall an extension of time was secured. The time will soon again be up, hence the speculation as to what will be done. In some quarters it is rumored that the 500,000 shares of the Plenaurum may be made exchangeable for shares in the McIntyre on a basis of one share of Plenaurum for two shares of the McIntyre.

Tough-Oakes' Gold Mines—According to current rumors, all is not running as smoothly as might be desired among certain of the interests involved in the Tough Oakes' Gold Mines. It is believed, however, that any differences that may arise will not imperil the company holdings, but, rather, may be confined to individual controversy. The prolonged litigation between the present Tough-Oakes' control and the Foster interests is still fresh in the memory of mining men of this district, particularly the shareholders of the company. The affair was regrettable in every sense of the word, having retarded the development of the mine itself and having been a draw back to the Kirkland Lake Camp. With the past experience still fresh it is thought that every reasonable effort to agree will be exhausted by those concerned in the present rumored dissension.

Dr. H. C. Cooke, geologist in the service of the Dominion Government is in the Larder Lake field where it is understood he will remain for the balance of this season. The field work being done by Mr. Cook will of necessity have to deal with that area recently covered by Percy C. Hopkins for the Ontario Bureau of Mines and covering which the Ontario Bureau issued a very recent report. Considerable wonder is being expressed as to the object which the Governments have in mind. For instance, last year the Ontario Bureau of Mines issued a report on the Matachewan Gold Area, the field having been done by A. G. Burrows. A few months later the Federal Government covered the same ground by sending in Dr. Cooke. A repetition of this proceedure in the Larder Lake district, therefore, could not do otherwise than to add to public curiosity.

At a time when numerous gold finds are being reported in various parts of the Dominion, prospectors of this country should bear in the mind the fact that the best place to search for mines is in the vicinity of the known mines, is the assertion made to the writer by a prominent geologist. Far away fields look green, and in a good many instances may prove to be as they appear, or they may not. The mineral wealth of Northern Ontario, he declared, has been demonstrated to be enormous and offers opportunities for the prospector. Everything is in its favor. Transportation, geological conditions and proven merit all combine to make it more attractive perhaps than any other field in the world.

Not to mention the leading camps of Porcupine, Kirkland Lake and Boston Creek, and make reference only to the prospective camps in this district such as Fort Matachewan, Larder Lake, West Shining Tree, Bourkes, Lightning River, etc., it is probably true that any one of these if found in some far away field would cause a large number of prospectors to leave this country. Therefore the words of caution offered by the geologist referred to above should not be taken lightly by Northern Ontario prospectors.

One point which has been exceedingly noticeable of late is the fact that finds which cause sensational reports to circulate in new and far away fields is found to receive but ordinary notice in Northern Ontario. The fact is that so rapid is the growth of the industry in this district that favorable developments have become quite commonplace with the result that they receive but passing mention whereas finds in new districts stand out more prominently.

The Silver Mines.

McKinley-Darragh.—During the first seven months of the current year the McKinley-Darragh realized net earnings almost sufficient to cover the full year's dividend disbursements of 3 per cent. quarterly. As a consequence of the labor strikes during the third quarter of the year the financial position of the company was not seriously impaired. Allowing the balance of September to gradually work back to normal production, a full quarter will still remain in which to accumulate a surplus over this year's dividend requirements and thus still further strengthen the treasury for the coming year.

It is significent to learn that during the first half of 1919 the cost of producing silver at the McKinley-Darragh averaged less than 60 cents an ounce as compared with an average of over 68 cents an ounce during 1918. Not only would this tend to indicate a gradual decline in the cost of material but would also indicate a higher degree of efficiency.

Using the first half of 1919 as a basis of calculation it is very interesting to note that the cost of producing silver declined at a number of the important producing mines of Cobalt. The impression seems to be that the peak was reached during 1918 and that from now on the lower cost of material and the higher working efficiency will for some time serve to permit the realization of an increasing margin of profit.

As a result of the favorable turn in the economic situation as already demonstrated, the dividend record of the mines may be expected to swell. With silver maintaining the highest average in Cobalt's history and with the cost of production on the decline, a prosperous period appears to be in store.

THE NORTHERN LABOR SITUATION.

Co-operation in the Porcupine Camp.

The mine workers in the Porcupine fields have reason to feel keen satisfaction over the outcome of the contest waged by labor in other mining centres throughout the country. Without any sacrifice on their part beyond reasonable co-operation with the representatives of the mining companies, the workers of Porcupine won the advantage of a very satisfactory minimum wage. Not only that but they are to participate in a system of insurance against illness as well as share the advantages of co-operative stores being operated by the leading mining companies.

The attitude of the workers of Porcupine throughout the period of industrial unrest has been doubly commendable for the reason that their course was chosen as a result of their own judgment and not as a result of examples set by other bodies of workmen in this country. From the beginning they appeared to recognize that the mining companies, like the individuals, were battling for an existence and that a solution lay not through a clash of ambitions but by wholehearted co-operation. In this way they have achieved the maximum wages and the minimum of hours and every reasonable concession that could be borne by the mining industry which supports the community,—all this without needless sacrifice.

Their attitude throughout has been business-like. Recognizing that it would be impossible to take blood from a stone, they at once began to plan a way in which the greatest good could be derived from their source of income. In sharp contrast to this is the manner in which the men of the Kirkland lake camp took an attitude of total disregard for the welfare of the companies. Incidentally they stopped at its source the means of livelihood of upwards of 500 men. The Kirkland lake strike has been in force exactly three months, and may continue for some time. Also, it is certain that when it does end, the workers will not be in as favorable a position as when they lay down their tools three months ago. The affair will represent a loss of time and much sacrifice, and with nothing gained for the reason that there was nothing that could be gained in that the industry was already paying all that could be borne.

The Strike Collapse at Cobalt.

The strike of the Cobalt Miners' Union collapsed on August 7th, after having lasted forty-six days. The thing was doomed to fail at its beginning. The men have returned to work without the Union having gained its chief demand for recognition, the number of working hours remains the same, and the combined wage and bonus amounts to the same as before the strike was called. Like all other affairs of the kind, it collapsed under the sheer weight of its unjust cause, and it probably marks the grave of the Western Federation of Miners' in this country.

As the workers of Cobalt return to their employment for which they receive higher pay than that obtainable for similar work in any other part of the country, they are likely to turn about and take stock of that lies in the immediate past. They see a loss of time amounting in the aggregate to close to one

hundred thousand work-days; they see a loss in payroll of close to half a million dollars; and, perhaps worst of all, they no longer see a reserve fund which they had formerly built up at some sacrifice. Their financial reserve in many instances has gone. The Savings accounts in the banks show this. Winter is coming on, with fuel to buy and with store bills overdue.

Paid agitators cost the workmen of Cobalt close to half a million dollars. For this the workers gained nothing. The agitators did not suffer, their salary going on during the progress of the strike. The pity Cobalt Miners' Union cannot read English and cannot see these facts recorded. They are "fed-up" with phrases coined for their consumption by the agitators, and are blinded to the folly of the way into which they are being led. It is among the illiterate that the erstwhile alleged leader Jimmy McGuire found his chief support and which element will in the future constitute the last shreds of the remnant of Western Federationism in this country. The educated worker has re-awakened and will probably no longer lend his support to that organization.

Some credit is due to James Lord, representative of the Mining Department of the American Federation of Labor. But for the visit of Mr. Lord it is probable that the radicals would have held sway for some time longer. However, perhaps no one recognized the futility of the effort and the unjust cause of the Cobalt Miner's Union better than did Mr. Lord He at once appeared to see that recognition can never be won by the Western Federation of Labor. He could not help but see that wages and conditions were all that could be expected. It was his visit coming just at a time when the Cobalt Citizens' Committee took up the question with the men that caused the vicious attempts of the radicals to collapse. In the light of these events McGuire representing the W. F. M. stands condemned as a failure, and the executive of the Cobalt Miners' Union wins a just reward for its utter incompetency.

Cobalt Situation May Re-Act at Kirkland Lake.

There is considerable speculation in Kirkland Lake with regard to what the future action of the Kirkland Lake Miners' Union will be now that the labor strike at Cobalt has terminated. It is generally conceded that the strike at Kirkland Lake was brought on unnecessarily and involved an aggregate of mines which were the least able to bear up under increased demands. Furthermore, the mine managers sent the full limit and met their employees in open conference, yet in spite of frank discussion the Union declared the strike on June 12th.

After making careful inquiry concerning the present situation, the writer has learned that the directors are a unit in supporting the management at the leading mines in their present stand. Also, according to official advice, the majority of the directors have long since been of the opinion that money would be saved by remaining closed until the spring or summer of 1920. In spite of this, however, it is believed that if the workers of Kirkland Lake would follow the lead set by the workers at Cobalt and at a representative meeting decide to return to work on the old conditions, a number of the companies might be found to make a new beginning this fall. However, even this would be very difficult on account of a shortage of coal, etc., and with cold weather not far off. It is the consensus of opinion that unless a beginning is made within the next thirty days there would be exceedingly small hope of any extensive operations being attempted until the winter passes.

The time seems to have arrived when the business men of Kirkland lake might make an organized attempt to induce the men to gather in conference, and, in view of the termination of the Cobalt strike, and harmonious conditions in Porcupine, discuss the entire situation afresh and reconsider the present difficult task of waging a long contest.

Larder Lake, Ont.

Associated Goldfields.—Outside of the producing mines of this district, perhaps no other property in the development stage is attracting greater interest than is the Associated Goldfields, of Larder Lake. Conservative mining men have been inclined to criticise the enterprise adversely, chiefly for the reason that favorable "reports" appear to be almost unlimited, while essential information on which to intelligently weigh the merits or demerits of the property are almost entirely lacking.

The Associated Goldfields Company has adopted a method of financing which appears to be at once unique and at the same time effective. "Missionary" work is carried on systematically at points where there appears to be a likelihood of fair number of speculators. Those found sufficiently interested in the proposition are gathered into groups and taken north by special car to see the property. At times these special car excursions are almost weekly occurrences. The visitors, it is understood, are each required to pay his or her share of the cost of the special car. The visitors are shown over the property. They are permitted to see with their own eyes spectacular showings of native gold. They are told about the great plans for the future, the building of one of the greatest reducing plants in the country, etc., and they leave convinced that the Associated Goldfields is indeed destined to become a world-famous gold mine. "What do we care for the opinion of mining engineers?" they have been heard to declare, "can we not see the gold for ourselves!" Thus, laboring under the delusion that visible native gold in spectacular patches constitutes a gold mine, they return south and purchase shares. As a result of this the company is now "reported" to have upwards of half a million dollars in its treasury.

So far as the public is concerned there is no detailed assay sheet in existance which shows the average grade of the ore as developed to date. The alleged ore bodies for all any man appears to know may prove to actually be turned to profitable account or may prove to be so many millions of tons of waste rock. Here it is that an exceedingly important point arises, which is this: If the property actually contains large deposits of low-grade, but nevertheless, commercial ore, then it would be a great pity to hinder the promoters in their effort to secure funds with which to carry on the proposed development work. On the other hand, in view of the fact that the opinion of leading engineers of this country has not been sought and no report issued along the usually recognized lines, serious doubt arises, and, in the opinion of the writer and in all sincerity the purchaser of shares in the Associated Goldfields takes one of the wildest gambles imaginable.

Up to the present not far under one million dollars

has been spent on the property, or, at least, not far under a million dollars has been spent by the company. In recent months the proposition has been referred to in this country as the North's "mystery" mine. This appellation is coined from the fact of the mystery as to where the money has been spent and the mystery concerning what has been developed.

It can therefore be seen that whether or not the property of the Associated Goldfields will ultimately develop into a profitable mining proposition cannot be intelligently estimated at this time. The absence of essential information appears to be ample reason for discouraging the public from risking finances in the enterprise.

One contention heard in the North concerning the company is that if the property is all that it is claimed to be, then it would only remain for the company to engage a leading mining engineer with proven and recognized ability in this country and present a report to the public. If such great things are in store as gossip would tend to indicate, then stock in this company would not go begging for buyers at $1 per share. Neither would it be necessary for the Associated Goldfields to dispose of its shares subject to pool. It is generally recognized that this method of financing (that of selling shares which the purchaser is obliged to hold in person for a given time) is borne of the fear that to-day's purchaser may be tomorrow's seller, hence the restrictions.

The fact is that those connected with the company are spending broadcast rumors which cannot be definitely contradicted perhaps for the all-important fact that no definite knowledge is obtainable as to the amount and the average grade of the ore. Until such information is forthcoming in an authentic way it would perhaps be folly to class the proposition as anything else than a wild gamble to say the least. This, not for the reason that the writer knows it to be such, but for the reason that no evidence is forthcoming to prove that it is not.

In a report recently issued by the Ontario Bureau of Mines after referring to the geological conditions, P. E. Hopkins, geologist, says in part: "Although this association of rocks and mineral solutions is not known to form ore in many parts of the world, still there is resemblance to the ore bodies on the Rawhide mine, southeast of Angels Camp, Cal. Small, medium-grade ore shoots do occur, as on the 83-foot level of the Reddick, and 500-foot level of the Harris-Maxwell. But they are isolated with little to indicate where they will be found, and what will be their extent." Mr. Hopkins further states: "Since the known richer shoots are small and scattered, the success of mining will depend upon the mining of extremely large bodies of low-grade ore which will necessitate much capital and very detailed mining."

Therefore, if the success of mining is to depend upon the mining of low-grade ore the question is this: How much low-grade is there actually in sight and what is the average gold content per ton? Also, what will it cost to treat the ore, and upon what calculations are the estimates based? Companies which in the past have gone to the public with such a proposition have made it a practice to present a report in detail. This the Associated Goldfields has not done.

It would be wrong to conclude without making it clear that there is no desire on the writer's part to discredit the efforts of the promoters of the Associated Goldfields. Neither is it a pleasant task to advise the public to keep out of the proposition. But unless or until authentic statements can be secured, it would be rank folly to advise otherwise. This, whether or not the property ultimately develops into an important gold mine or turns out to be the wildest of Northern Ontario's wildcats.

Notes.

The operations of the Gold Nugget Products' Company, Limited, is attracting considerable interest. The property is situated in the township of Henwood, a short way south from the Elk Lake branch of the T. & N.O. Ry, and was discovered by A. T. Stone. The Gold Nugget Products Company was formed for the purpose of purchasing the property from Mr Stone and proceeding with the manufacture of various products. It is stated that the rock before manufacture is so hard it will cut glass, but when ground and treated by special process produces the very finest wet hand cleaner, dry hand cleaner, goldfish sand, cleanser for household use, poultry and bird grit, washing powder, course and fine pumice, etc.

An interesting display of the product was to be seen at this year's Canadian National Exhibition.

Harry Oakes, president of the Lake Shore mine, has returned to Toronto, after having paid a brief business visit to the north.

A. Ferland left this week for Texas where he will be the guest of David Fasken. Mr. Ferland expects to visit the oil fields in Texas during his three weeks' visit in the South.

According to current reports, the decision is expected very shortly concerning the boundary dispute between the O'Brien Mine and the Violet property of the La Rose Company.

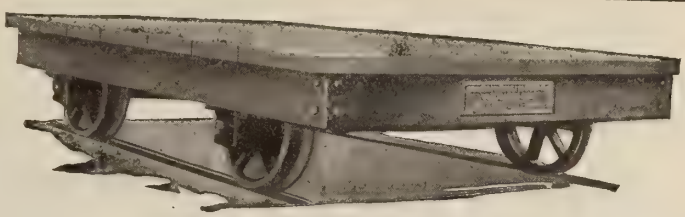
DEATH OF INSPECTOR OF MINES A. H. BROWN.

The recent death of Mr. A. H. Brown, at Owen Sound, has caused considerable regret in the north country, particularly among the mining fraternity, where he was well known and respected. Deceased had an interesting career since his graduation from the University in 1899. Until 1903 he was assistant chemist and assayer at Deloro, Ont., also in charge of the bromo-cyanide plant. From 1903 till 1905 he had charge of the 40-stamp mill and cyanide mill and cyanide annex for the Daly Reduction Co., at Hedley, B.C. Following this he was prospecting in the Cobalt district for two years, and took two years preliminary work re-erection of cyanide plants. He superintended the installation of an experimental plant to treat arsenical gold ore for the Canadian Exploration Co. at Naughton, Ont. From July to December, 1911, he was manager of the Pike Lake mines, Swastika, and in 1912 accepted the position of manager of the Hudson Bay mines. From January, 1914, to April, 1916, he was manager of the Dome Lake Mining and Milling Co., South Porcupine, and in 1917 was manager of the Green Meehan mine. He has been connected with the Department of Lands, Forests and Mines since the beginning of the present year.—Cobalt Nugget.

HOIST FOR DERRICK WORK

Made in 7 sizes up to 50 H.P., and with either one drum or two drums, as shown, or three drums for mechanical bucket work.

Boom Swinger can also be supplied, either the Geared Swinger, or the separate Swinging Engine, as preferred.



PUSH CARS

For Stone or other Heavy Material. Made any size or strength to suit your work. This is only one of the many styles of small cars we make. Our Mining Catalogue shows many others. Have you a copy?

STEEL BUCKETS

This is only one of the many styles of Steel Buckets which we make for the use of miners.
We can make you any style or size Bucket you require for mine work.
May we send you prices and photos?

WANTED

ENGINEER to design mining machinery, including electric hoists, for large Canadian manufacturer.

State education, experience, and salary expected.

Reply Box 2,

Canadian Mining Journal
Ste. Anne de Bellevue, P.Q.

PERSONALS.

Mr. Galen Stone, of Hayden Stone & Company, recently visited the Wabana iron-ore mines in company with Mr. D. H. McDougall of the Scotia Company.

Mr. C. E. Weed, manager of the Hancock Copper mine, Michigan, is in Toronto. He has just returned from a trip to Mexico and the South Western States.

Mr. Geo. R. Rogers was in Toronto for a few days after spending several weeks at the properties in the Wasapika gold area which are being developed under his direction. He has returned to Wasapika.

RECENT MINING INCORPORATIONS.

North Cliff Mines, Limited (No personal liability.) Incorporators: Mary Elizabeth Cherrier and Florence Gordon, stenographers; Edward Thomas Boland, company manager; John Francis Boland, barrister-at-law; and Charles Henry Bowyer, student-at-law— all of Toronto. Capital $100,000, divided into 100,000 shares of $1 each. Head office, Toronto.

Index Mining Company, Limited. (Non-personal liability.) Capital $200,000. Registered office, South Fork of Kaslo Creek.

Corrosive Action of Chlorine Prevented

THE world's largest chlorinating plant, which chemically treats four hundred million gallons of water daily for Greater New York, gave MONEL Metal an opportunity to prove its non-corrosive value for valve stems and other parts of the chlorinators which come in direct contact with chlorine gas.

After spending much time and money experimenting with various metals and alloys, the Wallace & Tiernan Company, Inc., who made this installation, found that MONEL Metal, due to its high nickel content, successfully resisted the intensive oxidizing powers of chlorine and stood up under unusually severe conditions.

As a result of this remarkable service, MONEL Metal is now used for valve stems and for many parts of the delicate control mechanism of the chlorinating systems and has been standardized to meet the requirements of all water sterilization equipment.

The great efficiency of MONEL Metal wherever acids, strongly alkaline solutions or highly corrosive gases are handled has led to its general use in the chemical field.

MONEL Metal is a natural alloy of nickel and copper—non-corrodible—strong as steel—tough and ductile. Withstands acids, alkalies, high temperatures and erosive action of hot gases and **superheated steam.** Can be cast, forged, rolled, machined, drawn, soldered, brazed, and welded by electric or oxy-acetylene method. Takes and retains a perfect nickel finish.

In the mining field where corrosion is nusually injurious, MONEL Metal has proved its superiority over other metals for mine screens, coal chutes, valve trim, pump liners, pump rods and various other parts of mining machinery equipment. Send for the MONEL booklets which tell all about this unique metal and the many other uses for which MONEL Metal has proved superior.

Write us for detailed information as to whether MONEL Metal could replace with economy and greater satisfaction the material you are now using. Our Technical and Research Department is at your service Address:

A REAL MINISTER OF MINES.

This issue of the 'Journal' contains two photographs taken at the camp of the Big Missouri Mine, Salmon River, B. C. This promising silver property is owned by Sir Donald Mann and associates, and is now being developed extensively by diamond drilling. It will be noticed that snow is still lying on the ground although the pictures were taken in mid-Summer.

The photographs are of unusual interest inasmuch as they show the Hon. Wm. Sloan, Minister of Mines of British Columbia, dressed in the insignia and performing the proper duties of his office. British Columbia is evidently fortunate in having a minister who "ministers". The real significance of this word has become obscured, and in many instances the "minister" has conceived himself to be not the servant of his office, but the "boss" of all and sundry. We have no doubt that the mountain air and the exhilarating prospects that an inspection of British Columbian mining camps and prospects affords will benefit a Minister of Mines greatly, even if he hails from so salubrious a seat of government as Victoria, B. C., and that actual inspection of mines, combined with the personal acquaintance of the men who work them, will give any minister of Mines that intimate and sympathetic knowledge that is requisite for the proper discharge of his ministerial duties.

INSURANCE AGAINST MINE INUNDATION.

In a brief article in this issue of the "Journal" Mr. F. A. McLean calls attention to the insurance value of "pumps on hand."

The necessity for an adequate reserve of pumping capacity is particularly present in submarine mining, where the ability to control an outbreak of water may depend on whether it is found possible to check the flow in the first stages and before the inrush of water has so enlarged the original point of entrance as to make subsequent endeavours to check the flow of no avail.

In one well-known instance in Nova Scotia, where water entered from the sea, it transpired that the pump at the top of the slope, which limited the discharge by its own inadequate capacity, was the smallest of a relay of pumps extending to the bottom of the slope. The pump at the bottom of the slope was furnished with about six feet of "lodgment," and was of course quickly drowned out, and the water which came in was so little controlled by the pumping equipment available, that it was always remained uncertain whether the inbreak was uncontrollable or not. If it should prove from subsequent trial that the inbreak in question was a controllable one, it may be said with exact truth that the mine referred to was lost because of the lack of a reasonable reserve of pumping capacity, and because of the neglect to provide "lodgment" or water storage capacity sufficient to give the management time to erect dams. The whole of the assets of this mine were lost through the inundation. The invention of the centrifugal pump, combined with electrical drive, makes it possible to provide enormous pumping capacity that can be quickly transferred to the place where it is required, and the provision of such an equipment should be regarded as a necessary insurance against a contingency, which in submarine mining, is always possible.

THE FUNCTIONS OF THE GEOLOGIST.

The service of geologists employed by the federal and provincial governments are at the present time much in demand.

Large sums of money have been expended on the geological mapping of the still largely unknown mineral-beating rocks of Canada, and, considering the meagreness of the appropriations available for this purpose, and the pitifully inadequate salaries that the resources of the geological surveys afford to geologists, it must be conceded that the work accomplished has kept reasonably in the lead of the mining development of the mineral areas of Canada.

It may even be that the mining incorporations of Canada have come to depend too largely upon the assistance of the government geologists, and there seems to be an idea abroad that those men should jump from place to place according as importance may appear to attack, first to this place and then to that place, because of mineral discoveries.

Herein lies a certain amount of misconception as to the function of the geologists, and there is some danger of dissipating the energies of a body of scientific workers whose numbers are inadequate for the task before them.

The work of the geologist is above all a process of research, and it is a first requirement for successful research that it shall proceed slowly, being guided from discovery by the steady accumulation of ascertained facts.

A thorough absorbtion of the geological data appertaining to a given field is only possible by long acquaintance and uninterrupted investigation of that field, and it may take a very long time to absorb suffi-

cient information to enable a conscientious worker to commence constructive theorizing and justify him in announcing conclusions.

We distinguish here between the search for geological data and its recording, and the higher function of geological research.

Unfortunately the financial reward of the geological research worker is too often meagre, and always belated, a necessary consequence of the slow—but not necessarily leisurely—nature of research in any branch of human endeavour.

But, conversely, the reward of research is of infinite possibilities, and has been instanced in our times by very material gains.

Large consolidations of capital, controlling extensive mineral areas, because of the self-perpetuating nature of the legal incorporation, are in many respects possessed of greater stability and are less open to change than the departments of popular systems of government. Popular governments are not of necessity either democratic or of long continuance.

It is not surprising to know that some of the larger mining incorporations have realized the responsibilities that long tenure of title occasions, and have seen the advantages of continuous geological research concentrated on their properties, and have, for these reasons, added a competent geologist to their permanent staff. Such an official can in the case of large companies be offered a larger salary and more untrammelled opportunities for constructive study than is possible in universities and government positions.

From the operating standpoint the employment of a geologist by mining companies is advisable on many considerations, particularly to advise in regard to development work. To drive an expensive tunnel on the strength of a "hunch" is not a lucrative proceeding, but it has often been done, and there is still a large percentage of those who direct mine development who have not realised that mining is a science and not a gamble.

The indications which guide a geologist to his conclusions as to the places where mineral will be found, seem often to the uninitiated to have but the remotest connection with the object of his search, and indeed their connection may be most indirect. Nevertheless, if the geologist is left to his own direction—always presuming his competence— he will in due time far more than justify his appointment.

Many a shaft has been sunk in barren territory, and many a drift driven to no purpose that could have been saved had a geologist been asked for advice. But the reward that follows the casual employment of a consulting geologist is meagre compared to the advantages that would follow the life-long concentration of a competent geologist upon a selected property.

The rewards of research are always proportionate to the extent and concentration of effort, and while even occasional consultation with a geologist may yield gold fruit, it is a proceeding that does not allow him to demonstrate the true function of his profession or to realise the full extent of the insight derived from his science.

We believe the readers of the "Canadian Mining Journal" will be interested in Mr. J. C. Murray's review of an old book upon Cornwall, reprinted in this issue from the "Mining & Scientific Press." As the Editor of "M. & S. P." writes:

"Mr. Murray, formerly Editor of the "Canadian Mining Journal" is a writer well-known on both sides of the frontier that has no guns or fortifications."

The common heritage of the English-speaking peoples is evidenced by the fact that an ancient treatise dealing with Cornwall should be regarded of sufficient interest to United States' readers to be included in the columns of so discerning a periodical as that edited by Mr. Rickard, than whom no technical writer has done more to cement the bonds which a common origin, a common language, and identical ideals have occasioned between the two nations that live, one north and the other south, of the unfortified frontier to which Mr. Rickard felicitously refers.

Mr. Richard's further comment on Mr. Murray's article will find an echo on this side of the line. He writes:

> "In the antique phrasing and quaint spelling "of Richard Carew's volume the reader will find "many examples of archaic English, and he will "recognize some of the terms used by the Cousin "Jacks, who have played so useful a part in the "development, for example, of the Lake Superior "copper mines, of the gold mines of Gilpin county "in Colorado, and of Nevada county in California. "The gold that "they kept in quills" recalls the "use of 'pure quill' to express richness of ore; "we are reminded also of the fact that the pioneers "from Georgia who first prospected Cherry Creek, "near Denver, in 1849, put the gold they found "into quills made from the feathers of wild geese. "The Cornish cherished the fallacy, as old as "mining, that veins and lodes increase in size "and richness the deeper they are followed. They "did it out of a meagre experience; our modern "promoter does it in the face of a vast array of "contrary testimony. The reader will find many "delightful touches in the quotations given by "Mr. Murray and will join us in thanking him for "this pleasant diversion from the beaten ways."

THE NORTHERN MANITOBA MINERAL AREA NEEDS RAILWAY TRANSPORTATION.

The Manitoba Government has announced that if the Federal Government will not extend the railway from Le Pas the seventy miles necessary to reach the district north of Le Pas which is now showing so much promise of yielding valuable minerals, that the

Province of Manitoba would itself do this. This is real good talking, and Manitoba would have excellent precedent in the construction of the Temiskaming and Northern Ontario Railway by the Province of Ontario. True this railway was not originally designed to open up the Cobalt and Porcupine fields, but incidentally it did this.

The reports from Northern Manitoba are of a most encouraging character, and it is interesting to read in our British Columbia correspondence that recently a shipment of 1,923 tons of copper ore was delivered at Trail, B. C. from the Mandy Mine, near Schist Lake, Northern Manitoba. This ore is handled forty miles by team from the mine, then shipped 125 miles by boat and barge to Le Pas, and from there sent by rail to the Trail Smelter, being handled six or seven times in transit.

The presence of valuable minerals in the new district is now beyond question, and by the courtesy of Dr. Wallace, the Commissioner for Northern Manitoba, the "Journal" has on a number of occasions been able to give first-hand information on these occurrences.

If Manitoba desires to realize the full benefit of the Province's fairly recent acquisition of this northern country the construction of a railway would appear to be the first thing to undertake, and it may well be that enterprise of such a commendable character may be as richly rewarded as was Ontario's enterprise under like circumstances.

If the construction of an ordinary railway is not possible, why not look into the suggestion recently made in the "Journal" that a light railway—such as was used in France—should be built?

RICH COPPER ORE REPORTED FROM GREAT SLAVE DISTRICT.

It is reported from Edmonton that Major P. Bansall, M.C. of Ottawa, has recently returned from a prospecting trip to the Great Slave Lake district, where he has staked a copper claim, the ore of which assays 49.2 per cent copper, 2 ounces of silver, and a trace of nickel per ton. The claim is located twelve miles inland from navigation on the lake.

During the past four years the district had been carefully prospected by George Bruce, who, unfortunately, fell a victim to the "flu" at the Calgary Barracks last autumn, within a very few days after his return. He had brought samples of ore with him, and rough notes as to location. He was unable to make a detailed report before his death, and Major Bansall undertook to trace Mr. Bruce's course in this Northern area. The Major was fortunate in meeting with an Indian who had accompanied Mr. Bruce, and thus experienced little difficulty in locating the copper prospect.

This work from the beginning has been carried on by a small Edmonton syndicate, who are very optimistic about the mineral possibilities of the country lying to the north of Lake Athabasca, the general formation being the same as that of Porcupine, Cobalt, and Le Pas.

CANADIAN ENGINEERING STANDARDS ASSOCIATION.

At a meeting of the Main Committee of the Canadian Engineering Standard Association, held on September 8th, Mr. H. H. Vaughan in the Chair, the following new members were appointed:

Mr. J. M. R. Fairbairn, nominated by the Canadian Pacific Railway.

Mr. H. H. Kelley, nominated by the Grand Trunk Railway.

Mr. A. F. Stewart, nominated by the Canadian National Railways.

Mr. F. A. Gaby, nominated by the Hydro-Electric Commission of Ontario.

Mr. A. A. Dion, nominated by the Canadian Electrical Association, and

Mr. J. Stadler, nominated by the Canadian Pulp & Paper Association.

The lists of members for the following Sectional Committees were approved:

Electrical Sectional Committee:
Chairman: Dr. L. A. Herdt.

Sectional Committee on Steel Bridges and Construction
Chairman: Mr. G. H. Duggan.

Sectional Committee on Wire Rope:
Chairman: Professor H. M. Mackay.

Recommendations as to membership of the following Sub-Committees were received and the Committees appointed accordingly:

Sub-Committee on Steel Railway Bridges:
Chairman: Mr. P. B. Motley.

Sub-Committee of Incandescent Lamps:
Chairman: Mr. John Murphy.

Sub-Committee of Transformers:
Chairman: Mr. A. A. Dion.

The secretary reported the progress made with regard to various questions already under consideration, and further reported a number of requests for action on the part of the Association. Several of these were approved for further enquiry and report.

The Chairman then welcomed Mr. C. Le Maistre, the secretary of the British Engineering Standards Association, who is now on a visit to Canada and the United States. Mr. Le Maistre described briefly the work of the B.E.S.A. and drew the attention of the Committee to certain matters in which his Association would welcome the assistance and co-operation of the Canadian Engineering Standards Association, referring especially to proposals which have been made with a view of obtaining some degree of Anglo-American agreement as to screw thread standards. Mr. Le Maistre further pointed out the desirability of international agreement as to rules affecting electric appliances and fittings, particularly for interior use.

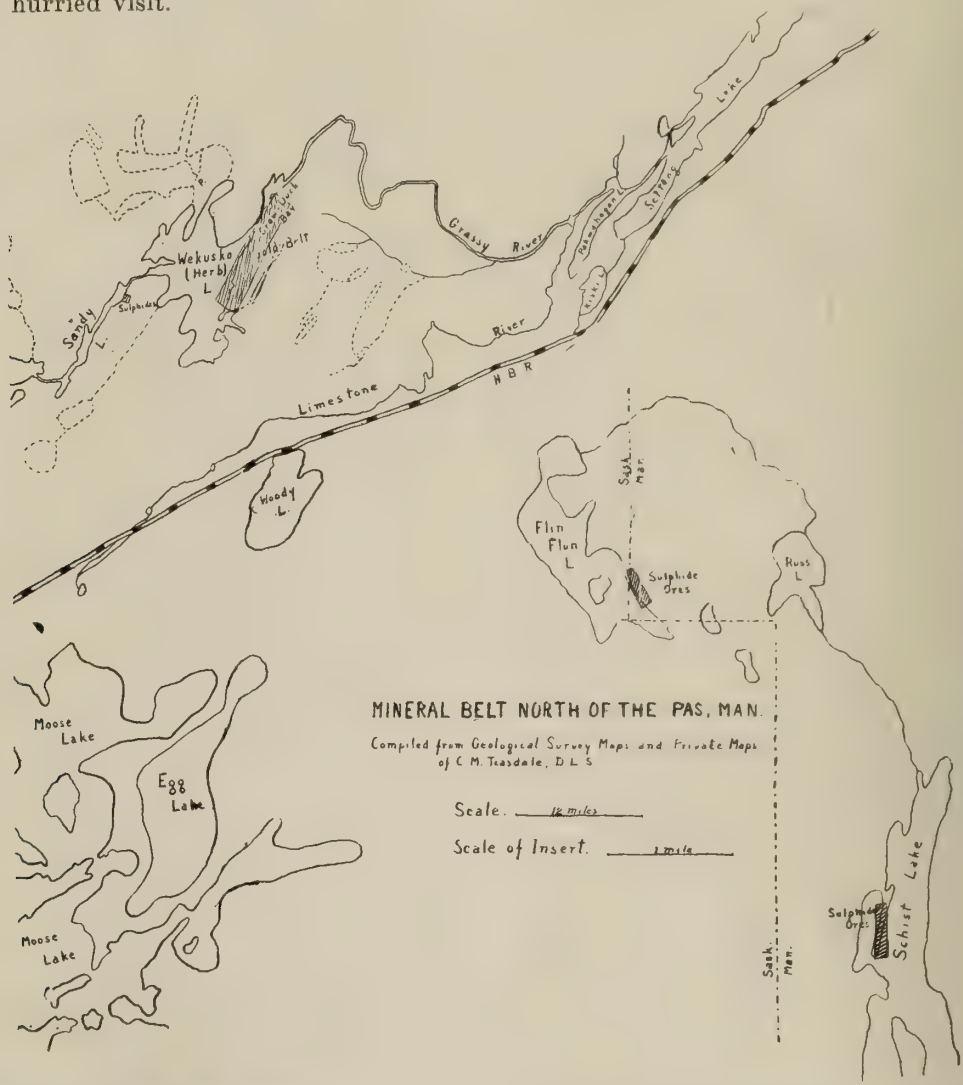
As regards the first suggestion, it was decided to appoint a Sub-Committee on Screw Threads, with instructions to consider and report on Mr. Le Maistre's communication.

Considerable discussion took place on the question of rules for electric appliances and the Committee agreed that the formulation of a Canadian Electric Code was most desirable. The Committee then directed that a Sub-Committee should be called together to enquire and report further as to this point.

Recent Developments in Manitoba

By Justin S. De Lury.*

The discovery of wonderfully rich gold ore in the vicinity of Copper Lake in Northern Manitoba by J. P. Gordon and his associates has aroused country-wide interest and has made that area the Mecca of prospectors and mining men during the past few weeks. The writer was fortunate in having a day or two to spend in the Copper Lake area and as few facts have been published in connection with the several discoveries in that vicinity, he believes that readers of the Journal may be interested in reading a few notes accumulated in a hurried visit.



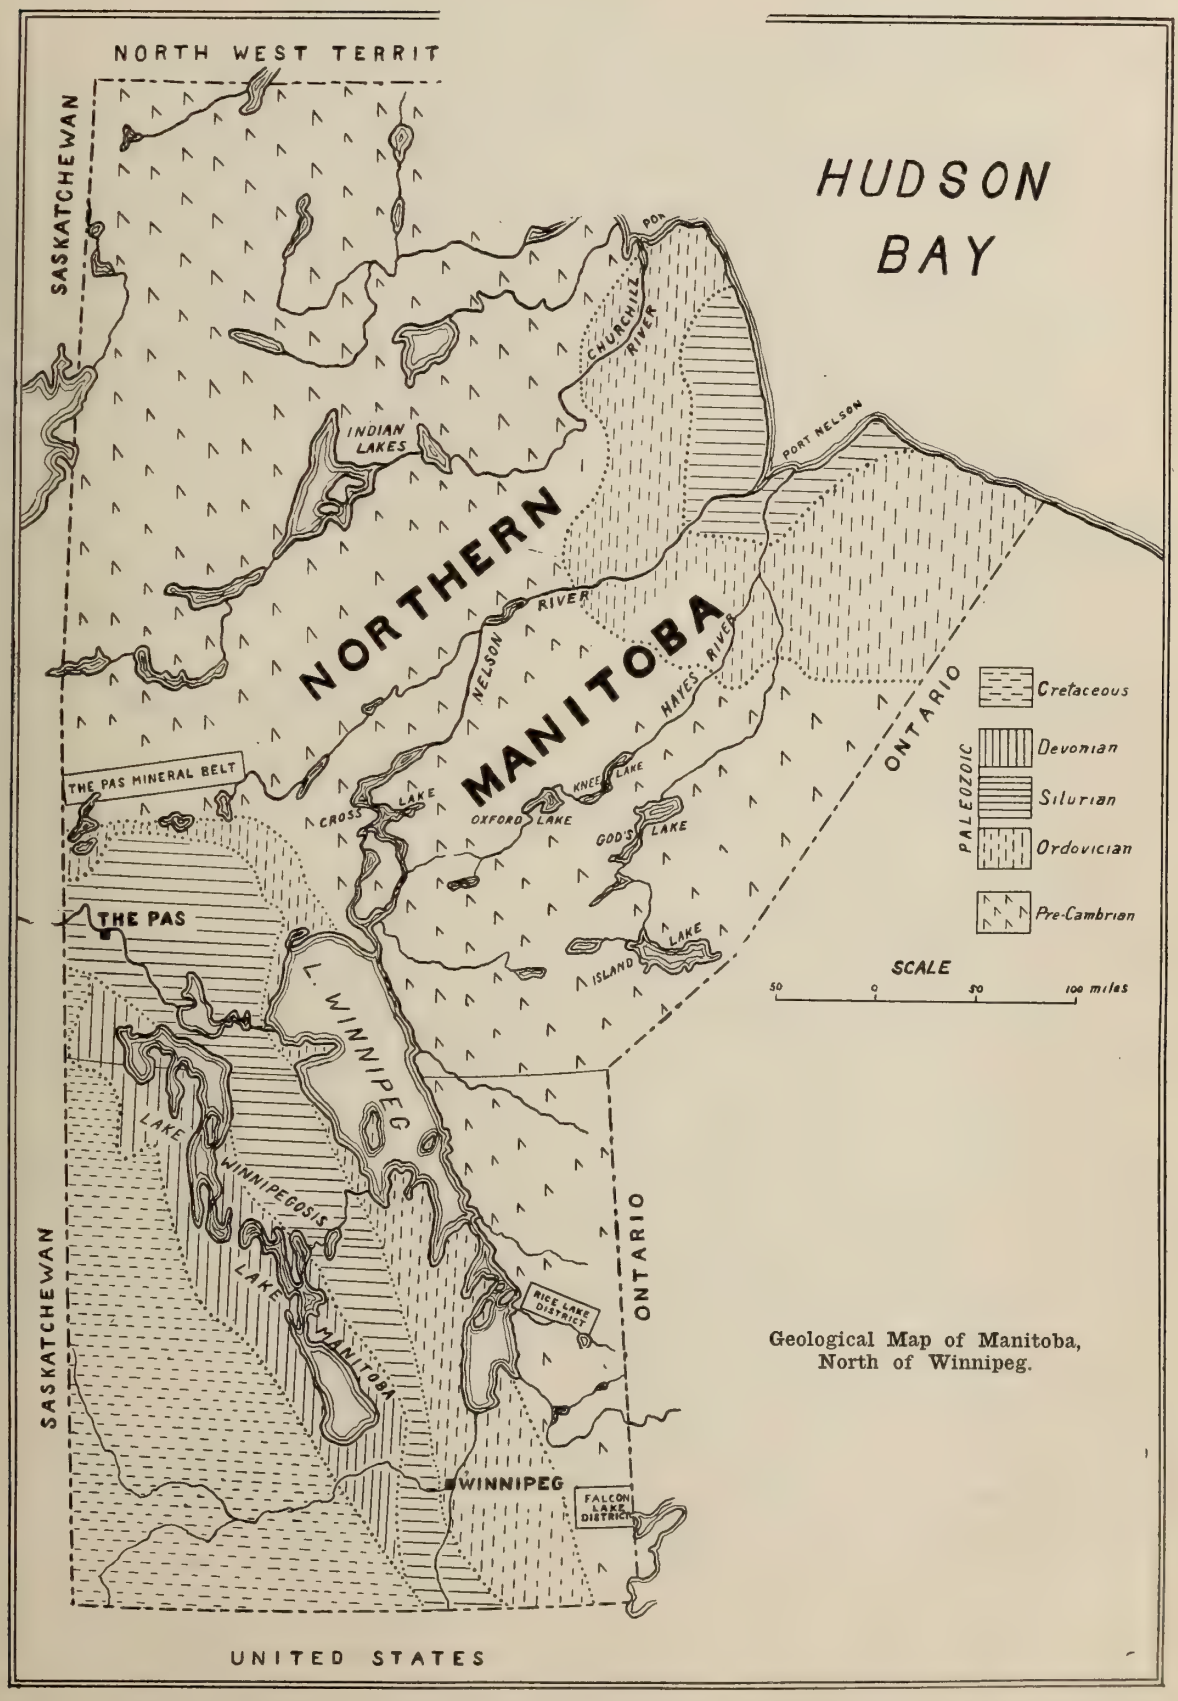
Rich Ore At Copper Lake.

The discovery that was given widest publicity by the press of the country was that of a very rich pocket of native gold in quartz occurring in a quartz vein near the shore of Copper Lake on a claim held by J. P. Gordon. Gold to the reported value of several thousand dollars was taken from this pocket which outcropped on the surface. At the time of the writer's visit some rich ore was still to be seen at the bottom of a small pit from which the high-grade had been removed. Running each way from the pocket, the quartz vein is exposed for a length of about four hundred feet, having an average width of quartz in this length of about a foot and a half and of sheared rock and quartz of three or four feet. On an adjoining claim to the southwest is a vein which might be a continuation of the other vein, from which it is separated by overburdened rock. This vein is traceable for several hundred feet with an average width of about three feet of quartz. The quartz in these veins, or vein, if they are connected, shows the following sulphides in varying though usually small amount: pyrite, molybdenite, chalcopyrite and pyrrhotite. A mineral occurring in very small grains suggested native bismuth.

Large Deposits on Gordon and Peterson Properties.

What appears to be a more important discovery is a large quartz vein which outcrops on claims held by J. P. Gordon and associates and on others held by Carl Peterson. This vein lies to the north of the previously described vein. It strikes northeast and is nearly vertical with a steep dip to the northwest. The average width as judged from the best outcrops appears to be at least twenty feet. The length as determined from the strikes and outcrops will doubtless be two thousand feet and may be about two miles. The writer

* Department of Geology, University of Manitoba.



Geological Map of Manitoba, North of Winnipeg.

has no first-hand knowledge of the values contained in this vein, but he has information which is regarded as reliable that on the principal outcrop on one of Gordon's claims, six samples, taken by picking pieces with the idea of obtaining a fair value for the whole width of the vein, gave values between nine and fifteen dollars in gold and silver. If these values are confirmed by more careful sampling and if they continue for a reasonable length in the vein, there is no doubt as to the future of the Copper Lake area. On this outcrop the vein is made up principally of a peculiarly jointed quartz, with joint planes so smooth and regular that they suggest a mineral cleavage. The vein is slightly pegmatitic near the hanging wall; the other wall was not so well exposed but it will probably be of the same nature. Fine-grained molybdenite was noticed particularly near the pegmatitic wall. Pyrite, galena and chalcopyrite are seen in fine grains scattered apparently through all parts of the quartz.

On the Peterson outcrop the mineralization is much the same. No molybdenite was noticed and the sulphides are segregated into larger masses. Galena shows in a width of over fifteen feet of the vein in this place and is quite prominent in two or three feet. Chalcopyrite and pyrite are mixed in fairly large bunches in some parts of the vein. On the hanging wall here the vein material closely resembles some of the phases of the sulphide bodies, to be mentioned later, and indicates a transition to this type of deposit.

Other Deposits in Copper Lake Area.

Other deposits of mineral have been found in the Copper Lake area, but so far they have been investigated very little to determine their values. There are some large quartz veins only slightly mineralized; one of these with scarcely any sign of sulphides is said to have produced a rich but small pocket of free gold. Other quartz veins are found, some of them of considerable size and traceable for several hundred feet, and showing combinations of the following sulphides in varying actual and relative amounts: pyrite, galena, chalcopyrite and molybdenite. No doubt many of these veins will be found to carry values in gold and silver, but whether in workable amounts it is impossible to say.

In the vicinity of the southern part of Copper Lake and of Brunne Lake are found some deposits of sulphides. These vary in width; some of them are a few feet wide and consist of almost solid sulphides; others are several hundred feet wide and are made up of solid bands mixed with schist impregnated with sulphides. The prominent minerals are pyrite and pyrrhotite. A little chalcopyrite is to be seen in places. From the mineralization of the district it may be judged that some galena and possibly sphalerite will be found in small amount associated with the other sulphides. Nickel is another possibility. The great similarity of these bodies to deposits in the Hawk Lake District in southern Manitoba suggest the possible presence of tin and in general low values except in sulphur for the bodies.

Flin Flon.

Unusual interest is displayed in other portions of The Pas Mineral Belt. It is expected that arrangements will soon be concluded whereby work in the way of railroad building and smelter erecting will be initiated with a view to developing the Flin Flon sulphide ore bodies. If this work goes ahead, no doubt the Tonapah Mining Company will continue production from the Mandy Mine; at the present time this company is shipping the high-grade copper ore taken from the mine last year, by means of barges working on the Saskatchewan River.

Herb Lake.

In the Herb Lake District arrangements have been made that a Winnipeg company will continue sinking operations on the Northern Manitoba vein; the shaft is already down 125 feet. It is rumored that the Rex mine will soon be reopened. Deals are pending which should result in a thorough investigation of the Gasse property, a prospect with considerable merit.

Rice Lake.

Several of the older Rice Lake companies have reorganized and some new ones have been formed. Some of these companies are offering stock for sale in the Winnipeg market. The public is safe-guarded in Manitoba to the extent that over sixty percent of the money received from stock sales must be spent in actual development work.

On the whole it may be said that in the opinion of men best qualified to judge, Manitoba is about to experience greater activity in mineral development than has ever fallen to her lot in the past.

NOTES FROM THE PAS.

Pleased with it all, and charmed with Northerners, the Duke and Duchess of Devonshire departed on Monday, after three delightful days in The Pas as guests of the town and Northland.—The Pas Herald.

The mining engineers of Flin-Flon syndicate will arrive in The Pas en route to the mines on Thursday, Sept. 25, it is stated by officials of the company. The object of the visit is for the purpose of further examination and to make preliminary arrangements for opening up the property. Mr. Raymond Brooks, who was here in 1915-16 in connection with this mine, will be a member of the party.

C. W. Greenlees is running a large force of men on a claim situated on the northwest arm of Schist Lake. This claim was staked by David Collins, and he found a large body of sulphide. He disposed of his interest to H. J. Bickle, who subsequently optioned it to Mr. Greenlees. The ore taken out resembles the Mandy, and Mr. Greenlees is exploring more fully to determine the tonnage and values.

Hon. Edward Brown is reported as saying that, unless the Dominion government builds a railway to the mines, from The Pas, the Provincial one will do it. All papers in Canada have carried this announcement, which concludes a warning that the Dominion government must act quickly.

This is of the greatest interest to the northland, and the importance of having this railway built, and at once, cannot be too strongly emphasized. It is the opinion of the Herald that if the Provincial government wants to get in right with the mining people of Canada, they can do so, by giving the Dominion government time enough to reply to a wire, stating they will or will not proceed with this line to-day.

The Survey of Cornwall

By J. C. Murray.

There is both refreshment and profit in discovering for one's self the points of view of old writers on matters pertaining to mining. Mirth and edification walk hand in hand as one reads the pages of the volume whose title is displayed above.

Richard Carew, the author of "The Survey of Cornwall," was born in the year 1555, at "East-Antonie, in the eastern part of Cornwall, within some miles of Plymouth." As a youth such was his precocity that he became a gentleman commoner of Christ Church when but 11 years old. At 14 years of age he engaged in a public debate with the "matchless" Sir Philip Sidney. Concerning his subsequent career, there are but hazy accounts. What is certain is that he became an ardent observer of natural history.

In the year 1602, Carew published his "Survey of Cornwall," and dedicated it "to the Honorable Sir Walter Raleigh, Knight, Lord Warden of the Stannaries, Lieutenant General of Cornwall." His dedication is more than ordinarily ingenuous and naive. It commences:

"This mine ill-husbanded Survey, long since begun, a great while discontinued, lately reviewed, and now hastily finished, appealeth to your (Lordship's) direction, whether it should passe; to your correction, if it doe passe; and to your protection, when it is passed."

He prays that "each wel-minded Reader will wish a merrie passage, to this my rather fancie-sporting, than gaine-seeking voyage;" and, before getting down to real business, he indites a charming little "Prosopopeia" of five verses, one of which runs thus:

"I curry not with smoothing termes,
Ne yet rude threats I blaste:
I seeke no patrons for my faults,
I pleade no needless haste."

Herefrom could many an over-deprecatory author learn wisdom!

Nearly every page of the "Survey" is tempting. However, we must content ourselves with those touching on mines and mining.

A brief sketch of the topographical features of the "Duchy" closes with the remark that "in the rest of this earthy description, I will begin with such minerals as her bowels yeeld forth. . . . These minerals are not so deepe buried in the entrailes of the earth, nor so closely couched amongst the Rockes, but that desire of gaine with the instrument of Art can digge them up: they may be divided into stones and metals."

Quarry-stones, pebbles yielded by the "sea-strond," slate, and limestone are successively dealt with. As to copper, our author confesses to small knowledge and less curiosity; for he states that at one mine the ore was shipped to Wales to be refined, whether to save cost of fuel, or to conceal the profits, he does not care to venture a guess.

Silver is dismissed with the statement that although it is found, nature has not been lavish, for "what she proffereth with the one hand, shee seemeth to pull backe with the other."

The tin miners, Carew asserts, found "little hoppes of Gold" in their ore. These they kept in quills and sold to goldsmiths, but with little or no profit.

Diamonds, he declares, are found cleaving to the rocks in which tin is mined. "They are polished, squared, and pointed by nature," from which we may estimate Mr. Carew's acquaintance with crystallography.

On tin our worthy observer becomes eloquent: "But why seeke wee in corners for pettie commodities, when as the onely mynerall of Cornish Tynne openeth so large a field to the Countries benefit? this is in working so pliant, for sight so faire, and in use so necessarie, as thereby by the Inhabitants gaine wealth, the Merchants trafficke, and the whole Realme a reputation: and with such plentie thereof hath God stuffed the bowels of this little Angle, that . . . it overfloweth England, watereth Christendome, and is derived to a great part of the world besides." Thus delightfully does Carew ramble in dithy-rambic prose.

Amongst other things, we are told of the Cornish miner's belief that Noah's flood, moving from east to west, on its course to the sea, produced by denudation all the alluvial tin. Stories of the discovery of tin veins ("loads") by means of dreams are repeated, though the author carefully refuses to guarantee their credibility.

Prospecting is described succintly, but picturesquely, in one paragraph. "Shoad," the drift "shed from the maine Load, and made somewhat smooth and round, by the waters washing and wearing" is sought for by casting up trenches five or six feet deep and three or four wide. Rivers are turned from their courses, a practice to be condemned as being "little beneficiall to the owners of the soyle" since the low grounds have "herethrough their wrong side turned outwards."

Prospecting to find the "loadworkes" begins by "coniecturing by the sight of the ground which way the flood came that brought it thither, and so give a gesse at the place whence it was broken off." At that place a shaft five or six feet by two or three feet is sunk to a depth of seven or eight "to prove whether they may so meete with the Load" . . . "But," advises the cautious Carew, "you may not conceive that every liklyhood doth ever prove a certaintie: For divers have been hindered through bestowing charges in seeking, and not finding, and many undone in finding and not speeding, whiles a fair show, tempting them to much cost, hath, in the end, fayled in substance, and made the adventurers Banckrupt of their hope and purse." A fair epitome, this, of the whole matter.

Carew speculates engagingly as to whether or not tin minerals grow in the rock. He discreetly leaves the question open after quoting authorities pro and con. A rich tin vein is described as one that "carrieth a foote and a halfe in breadth, and is not overbarren." a definition worthy of the most non-committal geologist of today. To work such a vein, the discoverer, unless his purse is "lined beyond ordinarie," associates himself with some more partners, who are either practical "tinners" or else adventurers willing to contribute money. The laborers, be it noted, worked for eight pence per day, or, if paid by the year, for from four to six pounds, out of which wages they paid their own keep.

Should the new mine assume respectable proportions it was duly christened and a mine overseer, or captain, appointed. In most places, according to Carew, the

toil was so extreme that a shift lasted only four hours, no miner working more than the one shift. "The residue of the time they wear out at Coytes (quoits), Kayles, or like idle exercises. Their Kalinder also alloweth them more Holy-dayes than are warranted by the Church, our lawes, or their own profit." Carew had first-hand experience of the Cornishman's passion for pastimes, some of them so strenuous as to result in serious wounds and even in deaths. Farther on in the "Survey," in discussing the rough game of "Hurling to the Countrie," he remarks that the players retired home as from a pitched battle. Yet there was always evident the sporting spirit. "All is good play, & never Attourney (lawyer) nor Crowner (coroner) troubled for the matter."

To proceed with mining, however. The manner of working was "to follow the Load as it lieth, either side-long, or downe-right."

But here our friend Carew falls into heterodoxy by asserting that "both waies the deeper they sincke the greater they find the Load." Alluding to open stopes, he states that "from some of their bottomes you shall at noone dayes discrie the Starres." The miners were let down and hoisted up in a "stirrup" by two men on a windlass. Shaft-sinking and drifting and the problems of ventilation are mentioned. Sympathy is expressed for the poor miners who meet death through falls of rock. Foul air and mine-gases are thus touched on. "While they (the miners) thus play Mouldwarps, unsavorie Damps doe here and there distemper their heads, though not with so much daunger in the consequence, as annoyance for the present." Sometimes the rock was so hard that a good workman could "hew" only three feet in as many weeks. Pumping was effected by man-power, horse-power, and water-wheels where drainage could not be had by means of "addits" (or "audits"). Carew marvels greatly at the engineering skill of "otherwise thicke clouded braines" in driving these "audits."

He is also wonder-stricken that the operators should be "anyway able to acquite the cost" of the subsequent dressing, breaking, and stamping of the ore. The stamping-mill of the day, which the ore was conveyed either "in waynes or on horses' backs," consisted essentially of "three, and in some cases sixe, great logges of timber, bound at the ends with yron, and lifted up and down by a wheele, driven by the water." From the stamping-mill the ore passed to the "crazing" mill, where it was fed between two grinding-stones (actuated by water or man-power) and there "brused" (bruised) to a fine sand.

But innovations were already creeping in. "Of late times," the author remarks, "they mostly use wet stampers, and so have no need of the crazing mills for their best stuffe, but only for the crust of their tayles."

The process of concentration was carried on by means of riffling the crushings over green turfs, three or four feet square and one foot thick. The concentrate was put into a wooden dish, broad, flat, and round, "being about two foote over, and having two handles fastened at the sides, by which they softly shogge the same to and fro in the water betweene their legges, as they sit over it, until whatsoever of the earthie substance that was yet left, be flitted away." But mark again the march of progress. "Some of later time, with a sleighter invention, and lighter labour, doe cause certaine boyes to stir it up and downe with their feete, which worketh the same effect."

Each partner in the venture then carried his portion to the "blowing house," where it was melted and cast into "peeces of a long and thicke squareness, from three hundred to foure hundred pound weight, at which time the owners mark is set thereupon." Once again Carew marvels wherein can lie the profit in going to such extraordinary pains—two or three months of extreme and increasing labor, numberless dangers and vicissitudes, and, last, but not in his opinion least, the "tynners" ugly countenances, tanned "with smoake, and besmeared with sweate."

The melting was done in lightly constructed thatched buildings. Once in seven or eight years these were burned down to recover the mechanically lost tin.

After reference to "coynage," the account concludes with allusion to the bargaining between metal-buyers and sellers. The former brought long tales of bad markets, idle stocks, dangers of piracy by sea, rumors of war, and so on, in their efforts to depress prices. "The owner, on the other side, stoppeth his eares against these charmes," and grows eloquent on the scarcity of tin and the waxing expense of winning it.

It is impossible to reproduce the charm of Carew's volume. Part of it lies in the quaint and uncertain spelling, part in the diction, which is tinged throughout with Cornish idiom despite the author's Oxford erudition. But mostly it consists in remarkable keenness of observation and frankness of expression, together with a gift for moralizing that is typical of the spacious times in which Richard Carew, Esquire, of Antonie, in the Duchy of Cornwall, lived, moved, and had his being.—Mining and Scientific Press.

In the case of Wellington Colliery vs Pacific Coast Coal Mines, Limited, in which the plaintiff company sought damages for trespass, alleging that the defendant company some years ago had gone on their property and extracted a considerable tonnage of coal, the Appeal Court of British Columbia has handed down judgment in favor of the Pacific Coast Coal Mines, Ltd, This reverses the decision of the Supreme Court Judge, who found that trespass had been committed and that the Wellington Colliery Company was entitled to substantial recompense. Chief Justice J. A. MacDonald, of the Court of Appeal, puts his judgment in few words which, in part, follow: "The question is purely one of fact, and when we have the evidence of two witnesses, whose credibility is not called in question by the learned trial judge, and who are men of standing in their respective callings, who give explicit evidence that the respondents' late manager consented to the acts complained of, his authority to do so not being questioned, and when that evidence stands uncontradicted by any other witness and is not rebutted by any other fact or document put in evidence, there can, in my opinion, be no doubt as to the course which I ought to pursue. I must either accept the evidence of these two witnesses or in effect declare that they have been guilty of perjury. In the circumstances of the case there is no reason for mistake. The consent was either given, as these witnesses have deposed to, or their evidence is false to their knowledge. We were asked to draw certain inferences in rebuttal of their evidence from what took place at an interview between Michener and Fleming, but such inferences are not necessary ones and cannot, in my opinion, prevail against the positive sworn testimony."

Showing camp at Big Missouri Mine, Salmon River, with Hon. Wm. Sloan, Minister of Mines of British Columbia, in the foreground. This was taken during Mr. Sloan's July, 1919, tour of the northern mineral districts of the Province, which now are attracting considerable attention.

General view of the camp, back of which is the property, which is owned by Sir Donald Mann and associates and now is being developed extensively by means of diamond drill. The Big Missouri is expected, by those interested in it, to have as great a future as a silver producer as the Premier, which already is widely known among mining men as one of the most promising prospects of the Canadian West. It will be noted that snow still is present, although the pictures were taken in midsummer.

The Steam Pump as a Factor in the Development and Operations of Mining Properties

By F. A. McLean.

Few people to-day realize to what a large extent improvements in mining practice have been dependent on the development of the steam pump nor the importance of the influence which the invention of the latter has exerted on the evolution of the steam engine.

Before the advent of the steam pump, water was removed from mines by means of buckets or antiquated wooden sucker or pitcher pumps, and it is a significant fact that all of the earliest workings in England, in China and other parts of the Orient, as well as in the United States, and Canada, were abandoned as soon as water was encountered in larger quantities than could be successfully handled by these methods.

The history of modern mining methods dates back only to the invention of the steam pump, the evolution of which has not only made extensive mining operations possible but has been indirectly responsible for the invention and wide application of the percussive rock drill for with this invention was inaugurated a new phase of civilization very aptly termed "The Age of Steam."

The invention was of such importance mechanically that it is doubtful if the steam engine would ever have been perfected were it not for the incessant demands for some form of prime mover, made necessary by the rapid expansion of the extractive industries which followed the inception of the steam pump. In its earliest forms the steam engine was little more than an adaptation of the mine steam pump and not always a successful one at that. From this point the improvement of the one has kept pace with the other till at the present day the modern steam engine and pump are a far cry from the crude form of mine pump from which they sprang.

Mining progress is still dependent on the pump, not because the development of the latter has not kept pace with the former, but because pumping equipment is not used as often or as much as it should be. Many mine officials through a mistaken desire to keep down operating expenses try to get along without a pump, or else endeavor to use an old or broken down one until they have wasted several times the cost of a good pump, which they usually have to buy in the end.

Time is generally a very important factor in mining and losses in this respect are usually of more importance than they would be in other directions. Construction of new mining plants is as a rule so planned that the completion of one part follows another in logical order and if portions of the plant are built and then forced to remain idle while waiting for some piece of equipment, an unnecessary loss is the result.

Sometimes a mine is forced to operate at only one-half or one-third of its normal tonnage while awaiting the pumping out of some shaft or drift which has been flooded or drowned out. In the case of newly opened mines, a railway siding may remain idle, or an expensive boiler and engine or compressor plant is shut down, or operated at a very small part of its capacity, because some portion of the development is under water.

With the many forms of portable electric, gasoline, and pneumatic pumping outfits for temporary use, as well as the improved forms of gasoline, electric, steam engine or steam turbine driven centrifugal pumps for permanent installations now on the market, there is no necessity for the protracted delays which characterized the early years of mining history. There is no reason at the present time for a mine manager to say, this shaft will be sunk or this tunnel driven in so many days if we don't strike water. Portable pumps guard against such contingencies and impart a degree of assurance and certainty to the work which could not be felt in the past. It is, of course, necessary to have the pumps at hand ready to be called forth at a moment's notice in case of emergencies.

The successful mine superintendent or manager looks ahead, and realizing the difficulties before him, takes the proper precautions to overcome them or turn them aside, while the unsuccessful one either fails entirely to look ahead or when he has done so, does not make any allowance for contingencies.

Nowhere is this fact more true than in the purchase of mine pumping equipment. Many mine superintendents, either through forgetfulness or indifference, do not place an order for their pumps of small size until they are actually badly in need of them, and then have to wait for their purchasing agents to secure them through the usual channels with all the accompanying delays and red tape.

In most cases the pumps should be ordered far enough ahead so as to arrive at the mine as soon as the timbers, whether the opening is to be a shaft, slope, or tunnel. The probabilities are that in any event water will be struck within a few days and it must be expected eventually. With the pumping equipment on hand a reasonably economical removal of the water, and a steady progress with the work is assured. Large mines will find it to their advantage to keep a number of small pumps on hand, as the capital invested in them need not be large and when properly stored they will not deteriorate. The money invested in this way may be regarded as the premium on an insurance policy that guarantees as nearly as possible against the interruption of operations through water troubles. Few of us object to paying a premium on life or fire insurance. Why should we not regard "pumps on hand" in the same light?

With the labor strike over and reasonable prospects of harmonious condition for considerable time to come, and with commercial bar silver quoted at the highest average in the camp's history, double incentive is offered for the exploration of some of the old but promising Cobalt properties which have lain idle for the past several years. This, in addition to the aggressive development of the producing mines.

Among the probable new operations will be the Farah property now owned by the Nipissing Extension Company. Also, it is understood, the old Hylands property will be opened up.

On the Hylands a thick layer of keewatin formation overlies the diabase and the geological conditions appear to be favorable. The property lies north of the Ophir.

CANADIAN COAL MEN.

The Canadian Mining Institute recently appointed a Special Committee to consider the formation of a Coal Mining Section, and on this Committee, Mr. Thomas Graham, the subject of our sketch, was named, which, we take it, is sufficient evidence of his right to be classed among the representative coal men of Canada.

Mr. Graham was born in Ayrshire, Scotland, on Christmas Day, 1867, and we should imagine has proved not a bad Christmas gift to his folks. He received, like so many of his countrymen who have succeeded abroad, a common school education, a privilege which Scotland affords to her sons of a character, which it is no disparagement of native ability to say, accounts largely for the dominance of Scotchmen in mercantile pursuits abroad.

Mr. Graham came to Canada in 1888, and worked as a miner in Lethbridge, Alta., until 1893. The next nine years were spent in Montana, Wyoming and Colorado. After a short return to Canada occupied as foreman at No. 2 mine of the Crows Nest Pass Company, Mr. Graham became superintendent of the Skagit Coal & Coke Co. at Cokedale, Wash. In 1904 he returned to Canada as Superintendent of the Western Fuel Company at Nanaimo, B.C., and continued in this position until the end of 1911, when he was appointed Chief Inspector of coal and metalliferous mines in British Columbia. This position he resigned in April, 1917, to accept the position of General Superintendent of the Canadian Collieries (Dunsmuir) Limited, which he now holds.

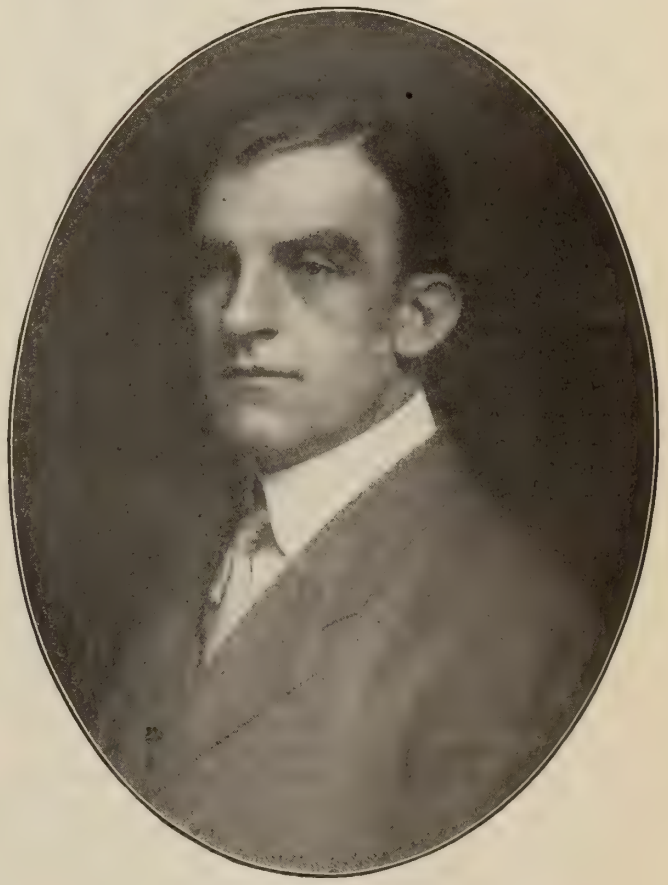
THOMAS GRAHAM,
Gen'l Supt. Canadian Collieries (Dunsmuir), Ltd.

Mr. Graham's connection with the Canadian Mining Institute dates back to his election as a member in 1908. He was Chairman of the Western Branch of the C.M.I. in 1916. He was elected President of the Mine Inspectors' Institute of the United States in 1916, holding over the two years the United States was in the war, and still holds this office.

PIONEER MINE ENGINEER JOINS GREAT MAJORITY.

Charles McConnell, a native of California, and a foremost mining engineer of the gold and silver camps of the North, is dead. He vied with Manager McCluskey, of the McKinley-Darragh Mine, as to which was the longest in the camp. No one disputed their claims as to being the pioneers.

Mr. McConnell had been a big man for the North and a big man for the financial and speculating people of the United States. Not only was he connected with the development of many valuable properties, but he made hundreds of trips to New York to interest investors in properties and succeeded in bringing much American capital to the North. He had a big New York connection.



CHARLES McCONNELL.

In 1905 Mr. McConnell was connected with the Hargraves Mine. Later he was with the Red Rock, then the Trethewey, the Walkman, Touch Oakes' Gold Mine and up to the time it fell prey to the bush fires this Spring, he managed the Patricia at Boston Creek.

His wife was a daughter of Senator Clemow, Ottawa, and she, with three children, survive.

Special Correspondence

BRITISH COLUMBIA.

The Collieries.

Coal Selling Prices Advanced:

Coal continues to advance in price in British Columbia, the quotation per ton to the consumer now being $11.50 a ton, as compared with the $6.50 asked before the war. The explanation, of course, is the high cost of production, although there is a disposition in some quarters to doubt whether the value placed on the fuel is justified. The jump from $6.50 to $11.50 did not come at once without notice. The process has been more or less gradual. During the war there was an investigation into production costs authorized by the Dominion Fuel Controller and, as a result, the price of coal at the bunkers of the various companies was fixed. Since the first of the present year the coal miners have received increases to their wages. Those employed by the Canadian Collieries (D) Ltd., the Pacific Coast Coal Mines, the Nanoose Collieries, and other companies, with the exception of the Canadian Western Fuel Co., have had their pay raised at intervals in proportion to the increase in the cost of the necessities of life. The extent of the additions to their pay envelopes is shown by the following table:

Date of Increase	Amount per day.
February 1st, 1919	2¾c
May 1st	2½c
August 1st	15 c
Total	20¼c

The men of the Canadian Western Fuel Company did not come within the general arrangement which brought to the employed of the other companies these increases. Recently, however, their representatives waited on the management and pointed out that their wages were not sufficient to meet the demands of the day on the purse of the householder. After some negotiation the company, recognizing the position in which the men were placed, agreed to advance the men's pay all round to the extent of 25c a day, and the same went into effect on the 1st of September.

With the increase in the miner's pay the companies, as was expected, there were some changes in the price of domestic coal at the bunkers and, to make the cycle complete, advances were recorded, almost simultaneously, by the retailers. On April 1st last the latter announced an increase of 50 cents a ton; on June 29th there was added another 50 cents; and on September 1st there was a further addition of 75 cents. Thus, since the beginning of the year, the retail price of domestic coal in this province has climbed $1.75 a ton.

While it is not expected that there will be any shortage of coal in the Pacific Northwest this winter it is a noteworthy fact that the miners have not been working full time during the summer. Owing to slack trade the Reserve Mine was closed down on the 30th of May, previous to which time the mines of the Canadian Western Fuel Company had been operating only four days a week. With the Reserve inactive it was thought that the other mines could be kept producing to capacity but this did not prove so evidently, as the other mines thereafter were worked an average of only 18 days a month.

All the Island Mines, as a matter of fact, have been working short time since the month of April and a careful computation of the loss in output from that month to the present date because of slack trade shows that it reached the substantial total of 192,807 tons. In this connection Hon. Wm. Sloan, Minister of Mines, has had prepared the following statistical table indicating how this loss was distributed among the various operating companies:

A detailed statement of days worked by different mines on the Island and estimated loss of tonnage through there being no demand, is herewith submitted up to the 31st of August, 1919.

Canadian Western Fuel Company.

	Days.	Loss in Tonnage.
Loss of time by mines in March	3	7,566

By Vancouver Island Mines.

Total loss of output through slack trade during 1919 equals 192,807 tons.

New Coal Developments:

A promising coal property situated about two miles west of Midway, B.C., and owned by the Boundary Mining & Exploration Company, which has been idle during the war, is likely to be developed. At a recent meeting of the shareholders of the Company, held at Cranbrook, B.C., a debenture issue was authorized to provide the funds necessary and it is expected that a substantial proportion of the same will be taken up by the shareholders. James Finch, of Medicine Hat, Alberta and E. B. Sawyer, of Spokane, were elected president and vice-president of the company. The property to which attention is to be directed has been developed to the extent that a seam having a general width of from four to eight feet has been exposed. Two tunnels have been driven, one 400 and the other 200 feet.

A considerable investment of capital in the development of Vancouver Island coal lands, situated in the vicinity of Nanaimo, B. C., is promised by Frank Carrel, proprietor of the "Quebec Daily Telegraph," who with other Eastern Canadians, is interested in these properties. Mr. Carrel returned a short time ago after making a trip to the Canadian West.

The Metal Mines.

Nelson, B.C.—On the property of the Electric Point Mining Company, which is situated south of the international boundary near Waneta, a new chimney of ore has been uncovered on which development is proceeding. Located on Gladstone mountain, about 12 miles from its shipping point, the Electric Point has a carbonate and sulphide ore, practically free of zinc and containing little silver. It occurs in large chimneys, 40 to 48 feet in diameter. The mine has been developed for the past four or five years almost exclusively by sinking with cross-cuts to connect the shafts, the depth of 800 feet being attained. The same lead ore belt is being developed on the Canadian side, where Messrs. Waldbeser & Reeves have opened a large low-grade vein on the low divide between the lower Salmon River and the Pend d'Oreille.

With further reference to the Eureka Mine it is announced by H. H. Vincent, president of the Vincent Development Company, which is handling the development of the combined Eureka-Granite-Poorman property for the Inland Mining Company, that the surveying of the 6,000 ft. extension of the tramway has been completed and that a contract for its construction will be awarded immediately. Mr. Vincent has inspected the work at the mines recently and reports that a car of concentrates is ready for shipment to the Trial Smelter. He says that it is much cleaner and better than that shipped in the month of August, owing to the tuning up of the Granite-Poorman Mill and to other improvements effected in the interval.

Merritt, B.C.

A systematic sampling of the iron ores of this district has been in progress recently with results which are described as satisfactory. Specimens were taken from Iron Mountain, the Titanic Group, the Porter Claims and from the Nicola District. While the assay returns are not all to hand those available run between 48 and 66 per cent hematite iron. Interested parties believe that this supply will solve the problem of the treatment of the large known deposits of magnetite of the Pacific Northwest by means of the blast furnace. On the other hand the extension deposits of limonite in the Bridge River District, carrying an exceedingly small percentage of objectionable impurities, is thought to assure a better flux for this purpose by others. W. M. Brewer, Government Mining Engineer, and a number of other experts, inspected the latter property this summer. Their reports have not yet been seen but from what can be gathered this limonite is deemed to be the ideal material for use with the magnetites of British Columbia in ordinary smelting practice. If this is so it would appear that the problem of the treatment of the magnetite referred to, a problem which has been concerning the Provincial Government and mining engineers for years and which led the former not long ago to obtain a report from Dr. Alfred Stansfield on the practicability of the treatment of these ores economically by means of the electric furnace, has been solved. However, until the new deposits are better known and have been proved up all that may be said on this point, after all, is speculation. This much, however, may be added: that capital is looking to the Canadian West with the idea of establishing an iron and steel industry and with the uncertainty as to fluxes for the magnetites which are known to exist in large quantity set at rest it is possible that the industry so much sought may become a realized fact before long.

Vancouver, B.C.

A representative collection of the ores of British Columbia was shown at the Vancouver Exhibition, which took place from the 8th to the 13th of September inclusive. There were attractive samples of silver, gold, copper, zinc, magnetite, wolframite, scheelite, cinnibar, bismuth, molybdenite, etc. displayed, the whole having been assembled under the supervision of the British Columbia Chamber of Mines. The exhibit from the Kootenays prepared by Fred A. Starkey, of Nelson, B.C., was one of the most prominent. It was a first-class index of the mineral wealth of that section of the Province. The lode properties of Sheep Creek, which are being extensively developed at present, were represented by specimens which attracted much attention. There were special exhibits also from the Surf Inlet Mines, the Dolly Varden Mines, the Britannia Mining Co.'s properties, the Granby Consolidated Mining & Smelting Co.'s mine at Anyox and elsewhere, the Canadian Consolidated Mining & Smelting Co.'s properties, the Drum Lummon, and the Bear River, Salmon River, and Portland Canal, gold silver, copper countries. The Skeena District and Gambier Island also were represented, as well as Alta Lake and Ypres, the two latter being on the line of the Pacific Great Eastern Ry. Another feature was samples of native and manufactured salts from the Basque Lake Deposits on the Thompson River near Ashcroft. Officials of the

Chamber of Mines, among whom may be mentioned specially W. Gray, the Secretary, as he had active personal charge of the exhibition, are to be commended for the satisfactory results of their efforts to prepare a display that would to some extent tell the story of British Columbia's mineral wealth. Prof. J. M. Turnbull, of the University of British Columbia, judged the samples.

Stewart, B.C.

Preston Locke, a mining engineer representing the American Smelting & Refining Co., Tacoma, Wash., recently visited the Portland Canal and Salmon River districts. Mr. Locke was favorably impressed with the development in progress. He said that the Remier and the Joker already were mines and there were many good prospects.

Great Activity in Northern Mines.

Just now there are many rumors of sensational developments in connection with the Big Missouri group of claims at the head of Portland Canal and 22 miles from Stewart, B.C.

A gold-silver ore body has been discovered on the Laura and E. Pluribus claims which has resulted in assays of from $50 a ton to over $600. One test showed $200 gold and 414 oz. of silver to the ton. There is also an immense amount of ore running $15 to the ton. Diamond drills are in operation, in some places being down 400 ft. and there is no sign of the ore body petering out.

Sir Donald Mann, who is now in Vancouver, holds the property under bond but refuses to say anything. It is said on good authority that he laughed at an offer of $2,500,000 for the property. Professor Bancroft of the McGill University, department of mines; Mr. Minard, a mining engineer of New York and E. Campbell, mining superintendent for the Granby Consolidated, are now inspecting the property. Some of the largest mining concerns have shown interest in the property and made offers for purchase.

It is believed that the Provincial Government has more information regarding this than has been made public as they are spending large sums in wharves, bridges and trails in this district. Supplies have been sent to the Missouri group from Vancouver the last few weeks and the number of men on the ground has been doubled.

Sir Donald is making his second trip north in eight weeks and mining men who have watched developments closely state that this is one of the finest gold and silver properties in the world.

Ore Exhibits At Vancouver Exhibition.

Mr. Lloyd Thomas, director of the Chamber of Mines and director of the Exhibition, were in charge of the British Columbia Chamber of Mines' exhibit at the Vancouver Exhibition, Sept. 8 to 13. They were assisted by Mr. K. Milne and Mr. H. W. Poole, returned soldiers, who are taking the assay course at the University of British Columbia. Their energetic efforts resulted in a splendid showing at the Exhibition this year. The display including every known grade of ore in British Columbia and many samples from outside districts, was the best ever collected in B.C. and one of the finest in Canada.

Considerable space in the Forestry Building was taken up by the exhibit and if the ore in sight were run through the crushers and concentrators there would result many thousands of dollars worth of copper, gold, silver, platinum, lead, zinc and other minerals.

A large collection of rare stones and minerals gathered from all over the world caused considerable interest.

It would be hard to select the most interesting exhibit, there were so many attractive ones. Much attention was shown to that from Nelson, which contained ores from Ainsworth and Sheep Creek. There were also special exhibits from Surf Inlet, the Dolly Varden, Britannia, Granby, Trail, Drum Lummon, Bear River, Portland Canal and a score of other districts. Good samples were on exhibit from R. N. Neill's famous Premier mine. The far-famed Engineer mine of Atlin had a fine exhibit of gold ores. An interesting display was that of concentrates from Surf Inlet gold ores, Ypres on the P.G.E., Gambier Island, Alta Lake, the Skeena, Queen Charlotte Islands, the Bush mines, were all to be seen in good array. There was silver and gold, copper and zinc, magnetite, wolframite, scheelite, mercury, bismuth, molybdenite and a score of other desirable metals and ores, and many other exhibits too numerous to mention.

A Faust concentrator was in operation showing the gold running over the tables. The concentrator handled at different times gold, silver, lead and zinc. Mr. F. H. Lamey was in charge and explained the process.

The display of mining machinery and equipment proved of great interest.

List of Awards.

The judge of the mineral exhibits at the Vancouver Exhibition was J. M. Turnbull, B.Sc., professor of mineralogy, University of British Columbia. Following is the complete official prize list:

Best exhibit of natural mineral salts. Basque Chemical Product Co.

Best general exhibits of ores, first (gold medal), Kootenay district, entered by Fred A. Starkey; second (silver medal), Portland Canal district, entered by Stewart Prospectors' Association.

Exhibits of ores from mines in various districts, first (gold medal), Kamloops, entered by Max Cameron, from the Kathleen group; second (silver medal), Coast district, from the Drum Lummon Mines.

Best exhibit of silver ore, Dolly Varden Mines.

Best exhibit of copper ore, Drum Lummon Mines.

Best exhibit of gold ore, Surf Inlet Gold Mines, Ltd.

Best exhibit of gold-copper ores, Bowena Copper Mines, Ltd.

Best exhibit of coal tar products, The Barret Co.

Best exhibit of molybdenite, Index Molybdenite Co.

Best exhibit of hand samples by individual prospects, first, Gretna group, Alberni district; second, P. Gilhoe, Spence's Bridge, and third, D. A. McKinnon, Vancouver.

The Drum Lummon Mines entered a splendid exhibit which attracted much attention from mining men. The specimens were taken from a mine on Douglas Channel, which is now shipping high grade ore and concentrates. The ore body is bornite and chalcocite with free gold.

NORTHERN ONTARIO.

The new policy recently adopted by the Baldwin Gold Mining Company in disposing of treasury shares without commission or brokerage charge is one that is looked upon with considerable favor in Northern Ontario. While it is only reasonable that in a good many cases there should be more or less expense in connection with disposing of shares in new mining enterprise, and while there has been no general complaint against charging commission sufficient to make it worth while for financial and brokerage houses to use their organization for the purpose of financing new developments, yet there have been a number of instances where the commissions charged, or the rake-off secured by the underwriters has been decidedly unreasonable.

The general impression appears to be that if other new companies would adopt a somewhat similar policy as has the Baldwin the ultimate result would be more favorable in that the money subscribed for shares would actually find its way toward development work, and not be "carved" to such an extent as to allow pennies to be devoted toward mining where in reality dollars may have been subscribed.

According to opinion in the north, it would perhaps be too much to expect that all new companies could arrange to do their own financing. Indeed, many of the brokerage firms are performing excellent service in raising finances for the development of mining properties. The impression appears to be that these concerns should continue to be encouraged, and an endeavor made to eliminate any of the concerns which abuse their privileges. In this such a policy as that adopted by the Baldwin Gold Mines should help, while the intention of the Ontario Government to enforce the Ontario Companys' Act should in a general way serve to elevate Ontario mining promotions to their proper plane.

The Argonaut Gold Mines, Ltd., a company which was recently organized for the purpose of taking over La Mine D'Or Huronia as well as a number of the adjoining claims, has completed the re-construction of the mill which was installed on the property several years ago. It is planned to use the mill as a testing plant for the time being.

The property is situated close to Beaverhouse Lake, along the east boundary of the township of Gauthier, in the Larder Lake district. Gold was discovered on the property several years ago, since which time considerable exploration work has been done. In a general way the result of exploration work has been quite favorable, and under efficient management and properly financed, the proposition would appear to be a mine in the making.

The Argonaut Gold Mine, Ltd., is stated to be a closed corporation. Mr. J. H. Rainville, ex-Deputy-Speaker in the House of Commons, being the president. The majority of those interested in the company are resident in Montreal, the head office of the company being in the Royal Trust Bldg., of that city. Mr. J. E. Hardman, of Montreal, is consulting engineer, while John W. Morrison has been engaged as general superintendent. Mr. Morrison is well known in this district, having managed the Lake Shore Mine of Kirkland Lake for a number of years.

During the week ended Sept. 12, the Coniagas shipped two cars containing approximately 137,125 pounds of ore. This is the first shipment from the Cobalt camp since the ending of the strike on the 7th inst.

During the course of the labor strike, the McKinley-Darragh was the only company to ship ore, while the Nipissing sent out a limited amount of silver bullion which had been held in storage at the mine.

The Nipissing Extension Mines, Ltd., which was just recently incorporated under the laws of Ontario, has since purchased property formerly owned by Nipissing Extension Mining Company, as well as the property formerly owned by the Farah Mining Company. It will be recalled that a discovery of high grade ore was made at outcrop on the Farah property in June, last.

The company has an authorized capital of $3,000,000, some $2,000,000 of which is outstanding and with $1,000,000 in the treasury.

A. J. Young, president of the new company, is well known in the north, being president of the Northern Customs Concentrators, Ltd. The vice-president, W. E. Stevenson, was formerly a director of the Temiskaming and other companies, and at present is a director of the Beaver. Hon. Albert Loening, New York, who is a director once served as United States Consul in Europe, and was a former commissioner of Texas for the city of New York. John W. Pickup, one of the directors, is a member of the firm of Fasken, Robertson, Chadwick & Sedgewick, and is intimately associated with a number of the mining companies operating in this district. M. Abbott Kimball, New York, is also a director of the new company.

Major Birkett, who will be resident manager, is a graduate of Queen's University and the Kingston School of Mines. In the early days he was in Cobalt, and later entered the Gowganda field. At the time of the outbreak of war he was general superintendent of the DeLamar Mine, Idaho, and which was then owned by the London Consolidated Mines Company, at which time Major Birkett joined the Canadian Expeditionary Forces.

"A collapse in the cost of material, the cost of labor, and the cost of living is in sight," declared a prominent mining man during the course of an interview this week with the writer. "The producing capacity of plants in the United States in 1914 was twenty-four billion dollars. The producing capacity of plants in that country is at present ninety billion dollars. Figured on a basis of prices obtaining in 1914 the present capacity is fifty billion dollars, or an increase of over one hundred per cent. The population of the United States increased only ten per cent, and ninety per cent of the increased output has been absorbed in foreign countries, the majority of which will now reduce imports to a minimum. The result will be unprecedented competition in the United States, followed by the closing of a large number of plants, a collapse in prices, very considerable unemployment, and a collapse in wages."

Asked as to what effect such a development would have on the mining industry, this mining man declared that it would "mark the commencement of one of the greatest booms ever known, particularly in connection with the gold mining industry. This, owing to the fact that the greater the collapse in wages the cheaper it will be to produce gold, and the greater the collapse in the cost of material and supplies, the greater will be the purchasing power of gold." He further declared that, in his opinion, as a result of developments of the immediate future the intrinsic value of gold mines would record a steady increase, and that already many big financial concerns were seeking opportunities

to place large sums in the shares of the important gold mining companies.

As though in corroboration of this view, is the statement by H. C. Hoover, who on his arrival at New York from overseas declared that "we have entirely passed the crest of high prices."

After examining a group of claims situated in the township of Katrine in the Larder Lake gold area, the Nipissing Mining Company has not been sufficiently encouraged to take over the property.

It is understood that some high grade gold ore is in evidence, but occurs chiefly in quartz stringers, and with the stringers not numerous enough to make the entire dike in which they occur of commercial value.

The proposition, it would appear, is characteristic of the Larder Lake district, where high grade shoots are found to be narrow and isolated, and where, according to government geologists, the success of mining will depend upon whether or not bodies of low grade ore will develop in sufficient quantity to be profitable to mine.

Cross-cutting at the top of a raise from the 310-ft. level a new vein has been encountered on the Adanac. At the point where cut the vein is about three inches in width, the composition being calcite containing fairly heavy leaf silver. It is too soon to be able to tell whether or not the find will prove to be of importance.

The Dome Mines, treating ore at the rate of upwards of 900 tons daily, and now taking steps to increase working forces by another hundred men, would appear likely to be operating at full blast before the end of the current year. The addition of 100 men to present working forces should serve to add about 400 tons daily above the present rate, and bring the plant up to full capacity of around 1,350 tons daily.

Development work is understood to continue favorable, and there appears to be an altogether optimistic outlook for the mine.

In some instances very considerable difficulty is still being experienced in securing a satisfactory number of men with which to carry on operations at the desired capacity at some of the mines in the gold district. The general impression appears to be that the arrival of winter will in all probability bring the desired relief, and, instead of working under capacity, the influx of men due to increasing unemployment in the cities will make it possible to operate at full blast.

The situation appears to offer an opportunity for the excess labor supply in the larger centres in old Ontario, to be absorbed in part at least in the gold mines of the Porcupine district where working and living conditions are very favorable, and where high wages are being paid. Working at a mine does not necessarily mean working underground. Forces are divided between surface and underground, some working in the mining plants and mills and others preferring to work underground. During the winter months the majority endeavor to get underground work where the temperature always remains the same, winter or summer.

Work is being carried on aggressively on the property of the Boston-McCrea Company, in the Boston Creek district. Although it was only during the past summer that the new company was formed, a large amount of exploration work has been done, and a number of important discoveries have been made.

Before commencing operations, Alfred R. Whitman, mining geologist, was engaged to examine the ground and offer advice. As a consequence of this, the work carried on has been systematic. So far, work has been confined to exploring the surface, and sinking shallow test-pits. Tellurides of gold have been found to occur in spectacular quantities, and assays show a gold content in the various deposits ranging all the way from around $1 or $2 to as high as several thousand dollars to the ton. Just as soon as the vein system is thoroughly explored on surface, the work of developing the more important veins will be gone ahead with, toward which end an electrically driven mining plant will be installed and sinking operations commenced.

During the past week a party of visitors, among whom were the following, spent several days at the property: E. L. Wettlaufer, Toronto; Geo. W. Morris, James W. Savage and C. F. Jordan, Buffalo; and N. W. Kirkpatrick, Dayton. Ohio.

With about 58 per cent of the total gold output of the Dominion coming from Northern Ontario, and with a probable extensive increase in output during the next year or so, the gold mines situated in the district of Temiskaming are taking on added importance. According to present indications, the gold mines of Porcupine and of Kirkland Lake, during 1920 will produce approximately seventeen per cent as much gold as the total output of the United States for one year. In spite of the present shortage of labor at Porcupine the production is now averaging close to one million dollars every thirty days. For the whole of 1920, with the labor dispute at Kirkland Lake settled, and with adequate working forces at Porcupine, and with the addition of one producer in the Boston Creek district, the output should exceed fifteen million dollars for the year.

According to the annual statement, the Porcupine Crown Mines, Limited, had a surplus of about $260,000 at the beginning of 1919. At the annual meeting held January 22nd, 1919, it was announced that ore reserves approximated $500,000. Owing to adverse economic conditions caused by the war, the mine was closed down about the middle of 1918. In the early spring of 1919 it was re-opened, but at the beginning of September the mill was still idle. It is planned, however, to resume production at an early date. The company is recognized as being conservative and the management is efficient. At the middle of September quotations on the open market place a value of from 31 to 32 cents a share. Taking all visible evidence into consideration the current quotations appear reasonable, and, with production once more under way a limited increase might follow. Up to the end of 1917 the company had paid dividends at the rate of 12 per cent annually. As to whether or not such a high rate can again be established seems problematical, although a moderate return for a limited period appears probable. The mine secures its income from one vein which has already been developed to a depth of 1,100 feet. For this reason it does not present very great possibilities of adding to ore reserves to more than more or less limited extent. The mine is equipped with a first class mining plant and a mill with a capacity for treating about 140 tons of ore daily. At from 30 to 40 cents a share it appears comparatively safe.

NOVA SCOTIA NOTES.

The Nova Scotia Steel & Coal Company is understood to be developing the lower seam in the Jubilee Shaft at Sidney Mines. The so-called Jubilee seam has two divisions, known as "Jubilee 'A' " and "Jubilee 'B' ". The top seam has been worked more extensively, but the coal it produces is not suited for metallurgical uses, and it has not been found possible to work this seam as regularly as the other seam in the Sidney Mines area. About twenty years ago a shaft was sunk to the lower seam, and a small area of workings was developed around the shaft bottom, after which the mine was temporarily abandoned. Quite recently a new shaft was sunk, also reaching the lower seam. For some time three headings have been driving to connect the old and new shafts and these headings have now been driven through. In the lower seam it is understood that a long wall face is developed, and if other conditions prove satisfactory, the output from this lower seam can be increased to any desired extent. The seam has an average thickness of 3 ft. 6 in., which is significent of the conditions obtaining in Nova Scotia that are forcing the development of the thinner seams.

In the "A" Jubilee seam, the Scotia Company has for some time been using a storage-battery electric locomotive for haulage purposes, with excellent results, so it is said. So far as the writer knows this is the only storage-battery locomotive in use in a Nova Scotia coal mine, and it points in the direction of the extended use of electricity in underground operations. Electric power in some form offers the only known motive power by which the development of the submarine coal areas off Cape Breton Island can be carried out. Steam and compressed air have limits of transmission that are too small to allow of their use in undersea workings to the extent that these workings are likely to reach in the future.

Dominion Coal Company:

The transformer house and three transformers at No. 7 Colliery were recently destroyed by fire.

The collieries in the Glace Bay district were idle on the 17th September for a local peace celebration. In publishing its decision to enforce a 24-hours' strike in the local collieries on this date in protest against the refusal of bail to the Winnipeg strike leaders, the U.M.W. leaders did not mention that it had previously been arranged that this date was to be observed as a general holiday.

The publishing of inaccurate rumors as to impending changes in officials at the headquarters of the Dominion Coal Company, has lately assumed annoying frequency. The possibility of obtaining accurate information by enquiry from those who are in a position to know, and the personal annoyance and even worse things that follow these irresponsible rumors, do not seem to occur to those who originate these rumors. The rule appears to be, publish the rumor first and the contradiction afterwards. Unfortunately, a thoughtlessly published newspaper rumor may damage or destroy a reputation gained by long years of endeavor.

A reflex of the slackness in the steel trade is seen in a recent report from Glace Bay that slack coal is being banked out at the No. 2 Colliery of the Dominion Coal Company. Owing to the practical stoppage of coke manufacture at Sydney—only sufficient coke is being made to keep the ovens heated—an outlet for some 3,000 tons of slack coal per day is temporarily closed. The genesis of the Dominion Steel Company was in the necessity for an outlet for slack coal, which formerly had been sold to New England gas companies at unremunerative prices, and the cessation of coke manufacture in Sydney has caused a recurrence of the old problem.

The Dominion Coal Company possesses a very fine coal-washery which was designed to wash slack coal for the Montreal market. A very saleable product was delivered from this washery before the war, but the plant has not been put to the extensive use that was contemplated when it was erected because of the demand for coal during the war, and the large amount of slack coal required for coking purposes, which on occasions even required coal to be crushed to slack to make up the shortage in the screened slack coal.

If the Dominion Company can find transportation for the washed slack, it will probably decide to commence washing slack coal for the Montreal market as was originally intended.

It is an interesting coincidence that an exactly similar reversal of slack demand was during the past week reported from Sydney, Australia, where owing to the stoppage of steel manufacture, a surplus of slack coal is accumulating.

The Late George Gray of Stellarton, N.S.

With much regret we learn of the death of Mr. George Gray of Stellarton. Mr. Gray was the doyen of the Nova Scotia coal trade. His connection with the Acadia Coal Company commenced in 1883 as a clerk in the office, from which position he rose to be the assistant general manager.

Mr. Gray's abilities as an executive and his understanding of labor difficulties were well known, and few men had such an all-round knowledge of the daily round of the operation of coal mines and the business of selling coal.

Mr. Gray took a keen interest in the duties of a citizen, and was prominent in all works of relief and mercy. As a citizen, and as an adviser in the difficult times through which the coal industry is passing, Mr. Gray's loss will be much felt. He had worked hard all his life and was looking forward to some well-earned leisure when he was attacked by a hopeless malady. Mr. Gray's death removes an outstanding figure in the Nova Scotian coal industry, and he can be ill spared.

Inverness District.

The management of the Inverness Colliery, which is being operated under conditions of unusual difficulty, have asked the workmen to consent to a reduction in wages, but so far the men have not consented to this suggestion. It is stated that the mine now employs 673 men, of which 390 are producers. The production per man employed is less than a ton per day. The Inverness Colliery, unfortunately has reached a point in its development when it can only be operated under conditions of high selling price for coal. It is the only operating colliery now left in Inverness county, except a small enterprise at Port Hood, and it is to be feared that production in Inverness will still further decline. The only hope for Inverness county to remain a factor in the coal trade consists in the possibility that some day a strong company, with adequate capital, may con-

solidate under one ownership all the coal properties in the county.

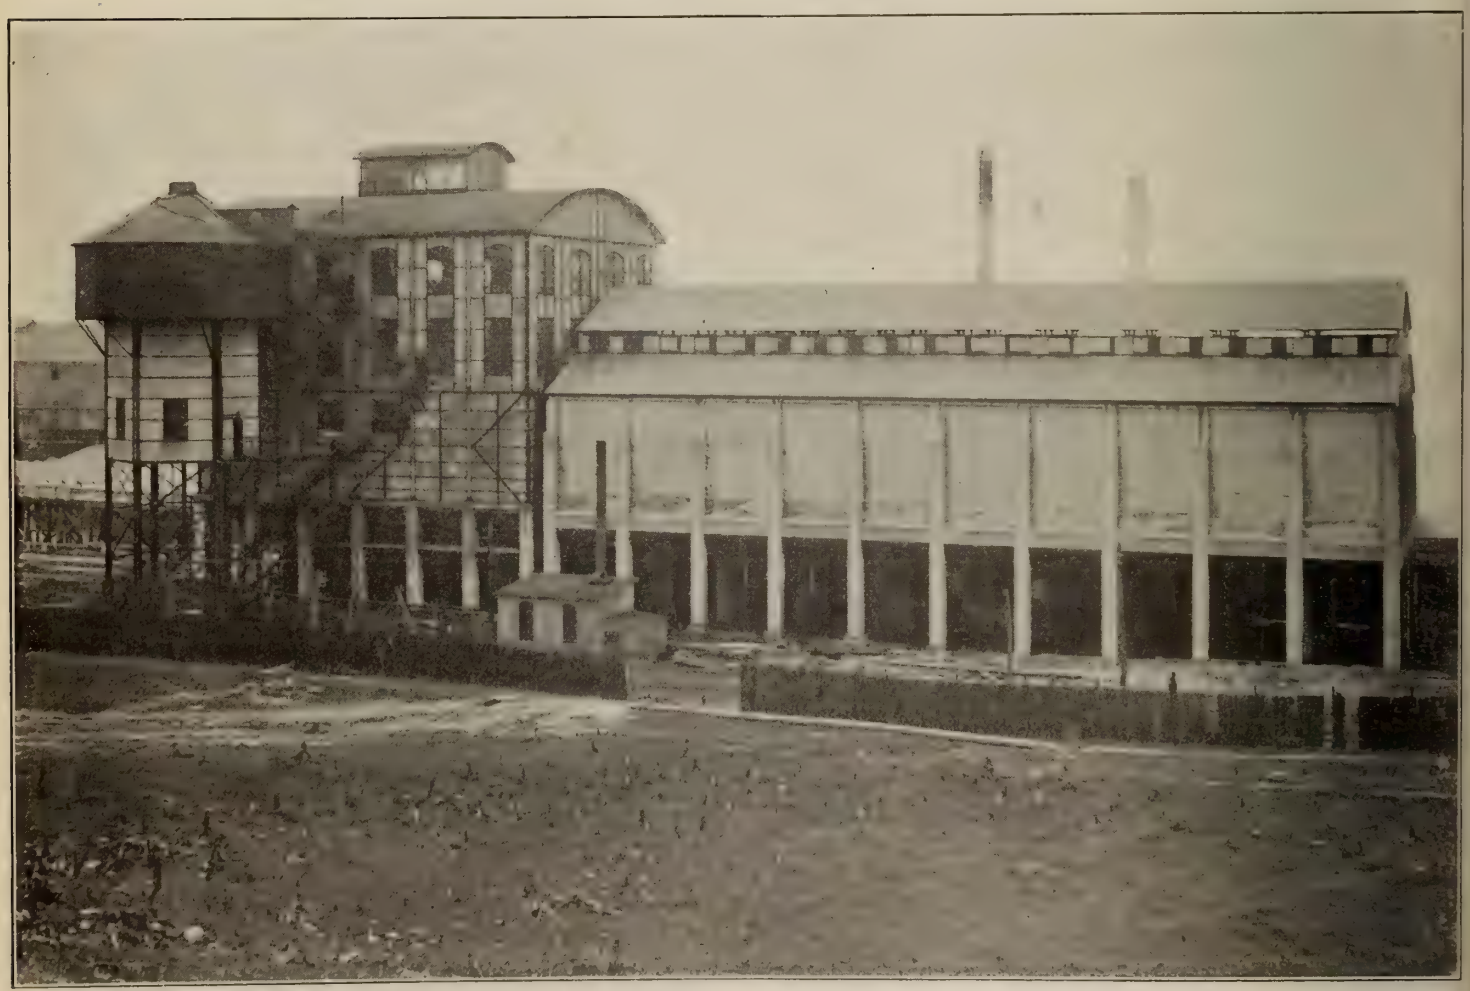
J. Allan MacDonald, manager of No. 10 Colliery of the Dominion Coal Company, was accidentally shot on a hunting trip and died as a result of his wounds. Mr. MacDonald had been in the service of the Dominion Coal Company all his life, having come to the Glace Bay district from Springhill Mines as a boy. He had risen by merit to be manager of the colliery where he was for a number of years the underground manager, and his death, by accident, deprives the Dominion Coal Company of a valuable official in the prime of life.

Minto, N.B.

A Board of Conciliation has been granted to consider the demands of the workmen at the Minto Mines. Local mining is being conducted under the limited conditions that the limited nature of the coal occurrences permits, and some of the requests of the miners, such as for check-weigh men, may require to be conditioned by the relative smallness of the industry in this neighborhood. This point does not seem to be quite realized.

Newfoundland.

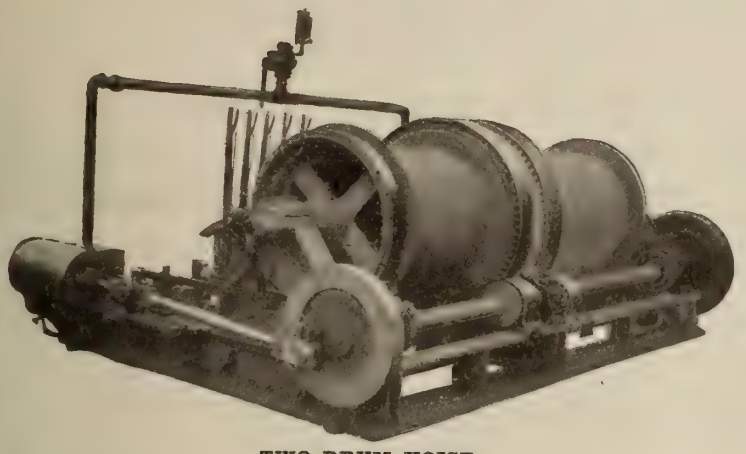
Encouraging reports of development in the St. George's Coal Fields' properties are heard. Exposures of the Jukes' seam on the Barachois River are said to have revealed up to 11 feet thickness of coal, but these reports must be accepted with reserve, as the coal occurrences in this neighborhood consist of seams highly inclined, and the measurements may not have been taken at right angles to the roof measures. The "Journal" is endeavoring to obtain accurate information on this interesting coal deposit. The lack of coal in Newfoundland is one of that colony's economic drawbacks, and any important coal occurrence there would have great meaning for the newly created Dominion of Newfoundland. Again the occurrence of coal on the other side of the Cabot Straits is quite evidently a continuance of the ancient coalfield which underlies portions of Nova Scotia and New Brunswick, and has an unknown extension under the Gulf and the Cabot Straits, and for this second reason much geological interest attaches to coal occurrences in Newfoundland.



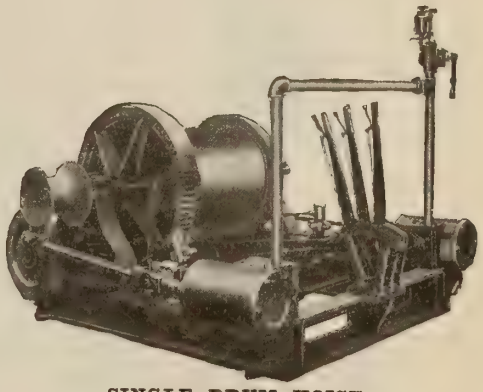
Dominion Coal Company's Baum Coal Washer at Sydney, shows Washer and Storage Hoppers for washed slack.

MINE HOISTS CHOICE OF 7 SIZES

From 10 to 50 Horse Power



TWO DRUM HOIST



SINGLE DRUM HOIST

Either of above Hoists is offered with any diameter of Drum up to 48 ins., and built for steam power, as shown, or for Electric Power.

Our new Mining Catalogue shows other varieties of Mine Hoists, also many other good things for Mines and Quarries, such as Cars, Cages, Buckets, Derricks, etc. Have you a copy? If not, drop us a card.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Vancouver Starts Plans for the Western Meeting of the Canadian Mining Institute.

With Dr. E. T. Hodge as organizer of the General Western meeting of the Canadian Mining Institute, to be held in Vancouver, Nov. 26 to 28, all members of the Institute may rest assured that they will have one great big time in the Western centre of Canadian mining.

Plans are being made which will insure the success of this meeting from every point of view. Readers of the Mining Journal will find something in the way of plans for this meeting in every weeks issue from now on. We want every member to read it and come on out and see our great big West if you have not already seen it. Those that have come again and renew old acquaintances, and see what we are doing out here in this great live country.

An endeavor is being made to raise additional finances preparatory to resuming work in due course on the property of the Baldwin Gold Mines, at Kenogami station, a few miles north from Swastika.

Before the labor strike caused curtailment of operations a shaft was driven to a depth of 215 feet on the Baldwin, and about 175 feet of cross-cutting was done, during the course of which considerable encouragement was met with. The property is equipped with a steam driven mining plant.

Mr. Charles Camsell of Dominion Geological Survey Returns From Kettle Valley District.

On Sept. 2 Mr. Charles Camsell of the Dominion Geological Survey arrived in Vancouver after a two weeks trip during which he surveyed gold deposits along the Kettle Valley Railway line. He reports many rich gold quartz veins. The "Emancipation" mine is the only lode working along the line and though it contains high grade ore, operations are carried on in a small way. The cost of labor and equipment has advanced considerably during the last few years and the price of gold has remained stationary, making it impossible to operate gold mines at a profit unless they are very high grade.

By placer methods of mining prospectors have discovered these same veins running across Siwash Creek and the Fraser River about Yale. By a slow process of denudation these veins have supplied much of the gold that has been taken from these streams. Estimates place the value of that taken from Siwash Creek at $3,000,000. Very little placer mining is carried on in this district now.

PERSONALS.

Mr. J. P. Gordon has returned to The Pas after a visit to Toronto.

Mr. Evered and Mr. Moodie of the Davidson Gold Mines are visiting the Herrick gold property, Wasapika area.

Mr. R. E. Hore has returned to Toronto after examining properties in the Wasapika area. He looked over a group of claims there and has directed attention to an area where the geological conditions are favorable for gold deposits.

Dr. W. G. Miller, Provincial Geologist of Ontario, who is at present in London as Canada's representative of the Imperial Mineral Resources' Bureau, expects to return to Toronto in October.

"TESTED"

The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

No. 103—22 Gauge Brass (Extra Heavy)

The hearty recommendation of Justrite users speaks for their perfection and ease of operation. Best of all is their economy. The name "Justrite" expresses its cost of operating as well as the quality of light furnished. It includes the great saving over the cost of candles—about one-half to be exact. Certainly this saving is worth every operator's consideration from the standpoint of economy. Scores of the largest mines in this and foreign countries use "Justrite" lamps EXCLUSIVELY. Whatever the conditions are, there is a "Justrite" made for every mining purpose.

A few of our many models. We make a suitable lamp for every mining purpose. Catalog on request.

EDITORIAL

ASIATIC COAL SUPREMACY.

The "Journal" reprints a condensed extract from the *Economiste Francaise* on the coal resources of the world, which is interesting in that the writer, Gaston Cadoux, has grasped, what the "Journal" several years ago pointed out, that the great anthracite reserve of the world lies in the Continent of Asia, and nearly all of it at that within the borders of China. M. Cadoux points out that it is already established that in China alone there is four times as much anthracite as in the rest of the world put together, and that while the coal reserves of Europe and America are fairly well defined as to quantity, the coal occurrences of China are only partially prospected.

China is one of the mysteries of the present age, and a greater mystery of the future. A perusal of the history of China will reveal that this vast territorial unit has passed through periods of magnificence, followed by periods of decay, and again followed by a rise in extent of territory and government, that have succeeded each other with almost monotonous alternation. In the history of China, the record of a single dynasty may cover 600 years, and be but an episode in the long story of successive decline and rise of national importance.

Should China repeat her traditional historical phases, and under some strong hand rise once more with all the resources of modern science, backed by internal reserves of coal and iron that exceed those of all the outer world. what may not this patient and resourceful nation achieve?

Many careful people fear the rise of Japan as a world power, but Japan must always be limited by her small resources of coal and iron, and by the small extent of her native islands, and the potentialities of the Japanese are meagre compared with the infinite possibilities of China. The vast reaches of Asia which lie between Tibet and the headwaters of the Yang'tse, are unknown, but time was when the rule of China extended to the borders of India. It may conceivably do so again.

If it is true that national power is derived largely from the possession of coal and iron, and who can doubt it after 1914-1919?—the hordes of Cathay are worth our attention. They have the essential raw materials of modern industrial civilization, they are very very numerous, and their form of national culture, while it may not appeal to Western minds, has not indeed occasioned a greater catastrophe than befell Europe but lately.

NEWFOUNDLAND NEEDS A GOVERNMENT GEOLOGIST.

Since the death of Mr. Howley, the Government of Newfoundland has not appointed a successor in the appointment as Government Geologist which Mr. Howley held for many years.

This strikes us as a regrettable omission. If any country needs a competent geologist it is the newly created Dominion of Newfoundland. The agricultural wealth of Newfoundland can never occupy the status it does in countries with longer hours of sunshine and fewer pre-Cambrian exposures. Newfoundland is known to contain asbestos, chrome, iron, in tremendous quantity; some coal, copper, limestone, lead, and many other minerals, but the country has never been thoroughly geologically surveyed and mapped. The task of doing this would be a difficult and expensive one, but it would be well worth while.

A recent article in the "Journal" told of some of the humors and some of the tragedies of prospecting and mining in Newfoundland, and in too many cases lost endeavour and mis-spent expenditures have been caused by inexact information. No country can hold its own in the modern race if it does not strive to the utmost to develop its natural resources, and when these resources are largely mineral, the services of a competent geologist are of first-class importance.

A country that possesses what is probably the most important hematite ore reserve in the north temperate zone is justified in employing the very best geologist obtainable. It is difficult to over-estimate the value of the Wabana iron ore deposit to the British Empire. The quality of the ore, its geographical location, its ownership by one of the associated British peoples as sturdy and valiant as Newfoundland has proved itself to be; the apparently illimitable quantity of ore present, and the lessening quantity of iron ore in the known reserves of North America, all go to make the Wabana deposit enormously important. The most authoritative report on the Wabana deposit was compiled under the direction and at the expense of the Canadian Department of Mines. The information contained in that Report was considered to be necessary to Canada. How much more does Newfoundland need such information for herself. A government geologist in Newfoundland is not a luxury, but a business necessity.

THE DESIRABILITY FOR STANDARDIZATION OF MINE-RESCUL APPARATUS.

In this issue of the "Journal" will be found a paper summarizing the development of mine-rescue apparatus, or, as we prefer to call it, the development of self-contained oxygen breathing-apparatus for use in mine rescue operations, which is a plea for standardization of apparatus and of training methods. Few who have had experience in these matters will dissent from the views expressed.

The paper mentions that the first oxygen breathing apparatus to be used in the United States were four sets imported in 1907 by the Anaconda Company, followed in September 1908 by purchases for the Technologic Branch of the U.S. Geological Survey for use in mine rescue work.

It may be of interest to mention that a self-contained breathing apparatus of the Giersberg type, the forerunner of the Draeger apparatus (the Draeger apparatus having been developed from the Fleuss apparatus), was purchased much previous to this date by the Nova Scotia Steel & Coal Company at Sydney Mines. In 1907, the Dominion Coal Company erected the first rescue station in America, and equipped it with Draeger apparatus. A sample apparatus was brought to Glace Bay in the Spring of 1907. As an instance of how little was known of these devices, it may be mentioned that the Captain of the Allan liner that brought this apparatus over, in passengers' baggage, insisted that it be housed on the boat-deck of the steamer in case it might explode and prove a source of danger to the vessel. Since this time, self-contained oxygen breathing-apparatus has become a recognized part of the fire-fighting equipment of a modern liner, and they were used in the Navy during the war for purposes that the ordinary gas mask will not accomplish.

We believe that great damage has been done to the proper understanding of the functions of breathing apparatus by the use of the term "rescue-apparatus." The proper function of these devices is as an adjunct to the colliery fire-brigade. Their usefulness in fighting mine fires has always been less open to question than their utility as a means of rescuing the victims of a coal-mine explosion.

The United States was not first in the introduction of breathing apparatus as a device to assist in mine-rescue work, but since these devices were adopted by our neighbours, they have shown a much better understanding of their proper function than has been the case in England for example. In England, the Home Office authorities prescribed the provision of breathing apparatus, but neglected to provide machinery to regulate their manufacture, or in any way to develop a standard approved type suited to English methods and ideas. In the United States, however, the Government led the way, and has developed a standard apparatus, after much trial and expenditure; and by a lavish dissemination of literature, it has educated the mining world not only to the great advantages of the self-contained breathing apparatus, but has directed attention to its limitations and is special functions. This is a much better proceeding than the damming of one apparatus by the sales agents of a rival type, resulting in an unsettled public confidence in all types.

The mining engineer who neglects to avail himself of the advantages which arise from the provision of modern breathing apparatus, and a corps of trained users, is not well advised.

The use of breathing apparatus is not by any means confined to mines. During the war, breathing apparatus was twice used in Sydney Harbour to remove burning sugar cargoes, on each occasion very successfully. Of other uses of breathing apparatus during the war, every member of a Tunnelling Corps is able to give first-hand evidence.

THE TALC INDUSTRY.

Of some interest to Canada is the formation of the Talc and Soapstone Producers' Association of the United States. While the production of talc from Canadian mines is not large, yet the industry is growing very quickly, the value of the talc mined in Canada being in 1918 three times what it was in 1914, and twice the value of the 1917 production.

The imports of talc into the United States ground or prepared, amount to approximately $250,000 worth per year, but importations are declining because of the growth of the home industry.

The formation of the new Association will doubtless occasion improvements in the practice of talc preparation, and will also no doubt keep prominently before it the welfare of the United States producer. Some attention to the proceedings of the Association will be worth the while of Canadian talc miners, as a great deal of the talc mined in Canada is exported to the United States to be prepared for the various uses to which talc is put. The use of talc for the manufacture of face powder is not the main outlet for the product of the industry, as might be popularly supposed.

PERSONALS.

A fair number of the members of the Canadian Mining Institute attended the Chicago meeting of the A.I.M.M.E., which opened on the 22nd September. Among these were included Dr. Alfred W. G. Wilson, of the Geological Survey, and Mr. John McLeish of the Mineral Resources Bureau of the Mines Branch. Mr. W. R. Rogers of the Ontario Mines Department was in charge of a complete and representative exhibit of Ontario minerals at the National Exposition of Chemical Industry, associated with the A.I.M.M.E. meeting.

The "Journal" was represented by Mr. H. W. Thompson, of the Toronto, and by the Editor.

Mr. A. R. Chambers, assistant mining engineer of the Nova Scotia Steel & Coal Company, New Glasgow, was also in attendance at the meetings.

The Gold Discovery at Copper Lake, Northern Manitoba

By R. C. WALLACE.

As fairly wide publicity has apparently been given to the discovery of gold at Copper Lake, Northern Manitoba, the following details with reference to the situation may be of service.

Location and Means of Access.

Copper Lake is situated on the headwaters of the Grass River, which empties eastward into the Nelson River. The Grass River may be reached from Mile 82, Hudson Bay Railway by a wagon road 10¾ miles in length into Herb Lake. The easiest route to Copper Lake, is, however, via Cumberland House and Sturgeon Landing, to which there is a weekly steamboat service from The Pas, and thence by canoe into Athapapuskow Lake and eastwards into the Cranberry Lakes at the headwaters of the Grass River. Copper Lake empties from the north through Brunne and Bear Lake, into the Second Cranberry Lake. The steamboat journey is made in one and a half days, and the canoe route from Sturgeon Landing to Copper Lake can be traversed in two days.

Geological Features.

Copper and Brunne Lakes lie in a somewhat restricted band of sheared greenstone and fine grained porphyry flanked on the east and west by a reddish granite which on the western contact is fairly basic. The strike of the rock is forty degrees east and the belt is elongated in the direction of the strike. Within the belt lie Copper and Brunne Lakes, and the mineral discoveries have been made on the east, but mainly on the west side of these lakes. The intrusions from the granite into the belt consist of irregular veins and masses of a very fine grained pinkish granite which is apparently identical mineralogically with the main granite.

Mineral Occurrences.

While there is a variety of mineral occurrences in this district, the discovery of a very rich shoot of gold on the property now known as the Red Rose has served to attract attention to this district as a whole and to the other properties already discovered in the district. The shoot appears on the east wall of a vertical quartz vein eighteen inches wide and occupies three inches on that wall. A pit has been sunk six feet deep on the shoot which apparently pitches steeply northwards in the vein and which may be seen at the bottom of the pit on the north side. The highly sheared and somewhat decomposed greenstone on the east wall of the vein shows very coarse gold in panning across 2½ feet at the bottom of the pit. The vein has been stripped

Canoe Route from Sturgeon Landing to Athapapuskow and Cranberry Lakes.

for two hundred feet and varies in width from eighteen inches to six inches. There has been considerable shearing in the zone in which the vein lies and breaking has taken place on planes transverse to the strike of the rock. On the adjoining claim to the south, in what is probably the same zone, reduplicated folding of a vein eighteen inches thick is very clearly shown. The pit on the Red Rose has been roofed over and locked down.

Less than a claim's width west of this vein a parallel quartz lode has been prospected over five claims by J. P. Gordon who later staked the Red Rose. This lode is well exposed over two thousand feet on the two most northerly claims, with cross trenches varying in width from fifteen to thirty feet. The other claims have not yet been sufficiently prospected to determine the extension of the lode, but on the fourth claim a large vein of quartz and country rock, less than half of which is quartz, is exposed for a width of 100 feet. The total length of the lode cannot be estimated until more work is done on the claims. To the north, three-quarters of a mile beyond a beaver dam lake, on the projection of the line of strike of the lode (42 deg. east) a vein has been cross-trenched by Petersen to a width of eighteen feet, showing much heavier galena mineralization than on the properties to the south. Galena is, however, a characteristic mineral in all the quartz outcrops along the line of strike, fine-grained except on the more northerly showings, associated with a little pyrite and occasionally chalcopyrite. In places the quartz has a rather peculiar cherty aspect, and owing to cross-strains breaks with a cleavage not unlike that of calcite. Preliminary cross-channel assays have been obtained which have indicated fairly high values in gold in this lode. The results of more detailed samplings are not yet known.

South of Gordon's claims and on a parallel line slightly further east, a series of claims have been staked from the south shore of Copper Lake, south-westwards along the west shore of Brunne Lake. These claims are now being prospected and on the more northerly claims of the group molybdenite and pyrite are the chief sulphides in a vein up to three and a half feet in width, while on claims 4 and 5 west of Brunne Lake, somewhat irregular masses of quartz carry abundant pyrite, some galena and chalcopyrite and no molybdenite. No information is yet available as to values on these (the "Dominion") claims. Still further east on a parallel line of strike a carbonaceous schist has been impregnated with pyrite and phyrrotite. Prospecting has been done on the northeast arm of Copper Lake and at the extreme end of the south arm of Copper Lake and along the west shore of Brunne Lake. Some idea of the extent of this iron sulphide mineralization may be obtained from the fact that on the Caribou claim west of Brunne Lake a rounded hill is well exposed on the line of strike of the iron formation at least seventy-five feet wide and is mineralized throughout with practically solid pyrite and phyrrotite. In places, as at the south end of Copper Lake, the iron sulphide bands are associated with bands of quartz only sparsely mineralized with pyrite. It would appear that this type of mineralization has affected a series of parallel bands of schist, between which lie bands of unmineralized massive greenstone.

Pit on Gold Shoot "Red Rose" Copper Lake, Man.

Economic Situation.

The importance in itself of the gold shoot on the Red Rose claim cannot at the present moment be accurately estimated owing to the fact that no considerable body of quartz has yet been uncovered in the line of strike in which this shoot appears. It is, however, significant as indicating the presence of gold in quantity at one place in a district where quartz and iron sulphide bodies are so extensively developed and particularly owing to the fact of its close proximity to an extensive quartz lode, preliminary sampling of which shows very encouraging results.

The district is somewhat restricted in area, though the limit of the narrow tongues of greenstone which extend northeast and southwest from the main area have not yet been fully defined. There is a remarkably

diversified mineralization within this area. The gold showing on the Red Rose points to the fact that at the time of the mineralization which affected the large quartz bodies as well as the smaller veinlets, very considerable gold was being carried into the quartz. The quartz and iron sulphide lodes should be thoroughly investigated by companies which are prepared to handle development work on an extensive scale.

Considerably more ground has been staked in the district than has yet been prospected even in a preliminary fashion. Apart from this unprospected territory, attention might well be directed to the greenstone belt northwest of the First Cranberry Lake, to that belt north of Twin Lake and west of Brunne Lake and to the extension of the Copper Lake belt northeast towards Separate Creek.

Big Lode Contact-Extension Claim, Copper Lake, Man.

THE NATURAL GAS AND PETROLEUM ASSOCIATION OF CANADA.

First Annual Convention.

The Natural Gas and Petroleum Association of Canada held its first annual convention at Hamilton, Ont., on September 19, 1919.

The sessions were held at the Royal Connaught Hotel. There was an attendance of upwards of 90 members and guests, and the report of the membership committee showed a growth of 57 per cent in the membership since the organization meeting last June. When the convention opened the association had a membership of 106, including 85 active, 18 company and 3 associate members. This number was largely increased in the course of the convention.

President C. E. Steele of Port Colborne, occupied the chair throughout the sessions. At the business meeting opening at 2.30 p.m. reports were presented from several committees; and the laws and legislation committee was empowered to further to the best of its ability a number of important matters involving assessment of gas enterprises, disposal of salt water from wells, introduction of a short form of gas lease, amendments to the Boiler Inspection Act to permit the use of boilers of oil country standard type for drilling and reduction or removal of duty on drilling equipment not manufactured in Canada.

The financial report presented by Secretary-Treasurer S. A. Morse showed a substantial balance.

The following were unanimously elected honorary members of the Association: T. W. Gibson, Deputy Minister of Lands, Forests and Mines, Toronto; Dr. M. Y. Williams, Geological Survey of Canada; Dr. Dresser, Vice-President of the Canadian Mining Institute; W. B. Way, Secretary of the Natural Gas Association of America; E. S. Estlin, Natural Gas Commissioner for Ontario; G. R. Mickle, Mine Assessor for Ontario; and the President of the Canadian Gas Association.

Following the business session, A. M. McQueen, Vice-President of the Imperial Oil Company, gave a paper on "Petroleum in Ontario, Reminiscence and Forecast" tracing the history of the petroleum industry from its very beginnings.

Mr. G. R. Mickle, provincial mine assessor for Ontario, gave an interesting paper on some phases of the natural gas industry in the province.

A practical paper by J. H. Stoliker of the Union Natural Gas Company pumping plant at Port Alma, Ont., on "Oxo-Acetylene Welding in an Isolated Plant," opened an extensive discusion of the various uses of the oxo-acetylene torch in repair work.

At 6.30 p.m. the anual banquet of the Association was held in the Royal Connaught grill-room, with President C. E. Steele as toast-master.

Mr. D. A. Coste gave a very interesting paper on "The History of Natural Gas in Ontario," tracing the rise, development and present situation of the industry. The paper was of especial interest in that Mr. Coste drilled the first successful gas well in the old Essex field, which marked the beginnings of the industry in a practical form; and has been identified with the gas development in the province ever since.

Dr. M. Y. Wiliams of the Geological Survey of Canada outlined the findings of his recent survey trip to the prospective oil areas in the James Bay district, which will later be covered in detail by an official report. Short addresses were also given by W. B. Way, secretary of the Natural Gas Association of America, by T. W. Gibson, Deputy Minister of Lands, Forests and Mines, and by Dr. Dresser, Vice-President of the Canadian Mining Institute.

Resolutions were passed authorizing the board of directors to take up the matter of increased gas rates should they deem it advisable, and to secure data regarding the demand for nitro-glycerine for well-shooting in Ontario, with a view to the establishment of a factory in the province.

The convention will hold its next annual meeting at Chatham, Ontario, on October 15 and 16, 1920.

The association was organized at a meeting held at London on June 18, 1919, and the officers elected on that occasion will hold office till the 1920 meeting. They are:

President—C. E. Steel, Port Colborne.

Firse Vice-President—A. M. McQueen, Toronto.

Second Vice-President—T. P. Pinckard, Windsor.

Secretary-Treasurer—S. A. Morse, Chatham.

Directors:—R. F. Miller, Selkirk; A. W. Parks, Oil Springs; J. B. Williams, jr., Sarnia; D. A. Coste, Niagara Falls; P. S. Coats, Chatham; H. R. Davis, Buffalo, N.Y.

WORLD'S COAL RESOURCES.

America's Supremacy.

The Importance of Extracting By-Products.

Gaston Cadoux recently contributed an article to the *Economiste Francaise* on the coal resources of the world.

The subject is an important one, says the writer, despite the progress made in the methods of exploiting water-power. Industrial supremacy in the future will lie with the people who possess the greatest reserves of solid mineral fuel at the best prices; and as far as is known of the coal deposits of the world, Europe and even America will be out-distanced by Asia, unless Europe takes prompt measures to retain its superiority.

According to the report submitted to the International Geological Congress at Toronto in August, 1913, the world's reserves of solid mineral fuel are 7,397,553 million tons, of more or less easy etxraction and all at a workable depth. This figure comprised bituminous or dry coal, lignite, anthracite, and anthracite coal, and was divided as follows: 3,902,944 mill. tons dry coal, 2,997,763 mill. tons lignite, 496,846 mill. tons anthracite. The distribution is shown below in million tons:

	Lignite.	Coal.	Anthracite.	Total.
America. . . .	2,811,906	2,271,080	22,542	5,105,528
Asia	111,851	760,098	407,637	1,279,586
Europe	36,682	693,162	54,346	784,190
Oceania. . . .	36,270	113,481	659	170,410
Africa.	1,054	45,123	11,662	57,839
Totals. . . .	2,997,763	3,902,944	496,846	7,397,553

The relatively small deposits in Africa and Oceania may be disregarded in the present connection. America has by far the richest store; but the cost of exploitation detracts from the industrial value of the fuel as compared with that of Chinese coal, and the future Asiatic industry seems likely to be able to deliver coal at much lower cost. Although Asia contains much less lignite and bituminous coal than America, there is in China alone four times as much anthracite as in the rest of the world put together. Moreover, there is in Asia about 67 milliard more tons of coal than in Europe, and it must be remembered that although recent prospecting has discovered extensive anthracite beds in the plains of Shansi, Szechuan and Honan, no satisfactory or complete investigations have been made with regard to other coal reserves; while the returns for Europe, in particular for Britain, Germany, Belgium and France, leave little room for any future increase. Such considerations show that while Europe has little to fear from American rivalry, the new Asiatic industry will probably offer considerable competition, being in command of unlimited labour and abundant cheap coal. Every effort must therefore be made to retain the low price of coal and to achieve perfection in its utilization. The discovery and exploitation of natural gas, petrol reserves, and water power cannot, at present, bear any comparison with the advantages to be derived from the distribution of reserves of solid fuel.

In France, for instance, it is calculated that a thorough utilization of all water power will result in an annual economy of 8 to 9 mill. h.p.; but as industry will continue to develop while this result is being achieved, the consumption of coal will remain large. Pre-war consumption totalled 60 mill. tons per annum, and it may safely be estimated that the extension of electric power will represent from 30-35 or even 40 mill. tons each year. The demand for power will in all probability have doubled by that time, and if, out of a total consumption of fuel equal to 120 mill. tons of coal, 40 mill, may be economised by the use of electricity the annual consumption of coal will still be 70 to 80 mill. tons.

In order to compete successfully against the low prices of iron-ore, cast-iron and coal which will obtain in Asia, it is essential that all manufacturing processes be perfected as far as possible, and that the greatest economy and most scientific utilization of fuel be achieved. This problem has occupied manufacturers and economists for some years past, and a very clear exposition of the question as well as its solution appeared in the review *Chimie et Industrie,* November, 1918.

The solution is the substitution of electric power, wherever possible, for other kinds of power, and the use of coke, gas, heavy oils, benzol, etc., the by-products of coal, instead of raw coal as extracted from the mine. If the amount of coal at present consumed in a raw state was distilled before use, 5 milliard cu. m. of gas, 35 mill. tons of coke, 500,000 tons of heavy oils, 1,250,000 tons resin, 600,000 tons sulphate of ammonia, and 250,000 tons benzol would be obtained from 50 million tons, and, at the normal pre-war prices, would value 2,221,-250,000f.

In addition to the advantages to be derived therefrom by industry, such a production of sulphate of ammonia, in conjunction with the potash of Alsace, would produce the quantity imported annually by France before the war. Every acre of ground could be cultivated.

Among those who proceeded to Pittsburgh to attend the opening ceremonies of the U.S. Bureau of Mines on the 29th September were Messrs. McLeish and Chambers, and it was expected that Mr. B. F. Haanel of the Mines Branch would also be present at the proceedings and the Safety First meeting that follows.

THE DESIRABILITY FOR STANDARDIZING MINE RESCUE TRAINING AND PLAN FOR SAME.

by D. J. Parker, U. S. Bureau of Mines.

The modern mine rescue breathing apparatus is a self-contained device, the function of which is to permit the wearer to penetrate irrespirable gases formed by mine fires or mine explosions.

There are several types of breathing apparatus, one of which depends on liquid air for the breathing supply, a second depends upon the generation of oxygen from a chemical compound, a third depends upon normal air under pressure, and a fourth, which is most widely known in America, depends upon pure oxygen under high pressure for its air supply.

The history of breathing apparatus dates from the yar 1868, when a device was used similar to the submarine diver's helmet. Practically all succeeding forms were built along similar lines until 1896, when the present portable self-contained type was devised and used abroad. The first self-contained apparatus to be used in the United States were four sets imported in 1907 by the Anaconda Copper Mining Company of Butte, Montana. In September, 1908, breathing apparatus was purchased by the Technological Branch of the United States Geological Survey, for use in mine rescue and recovery work, which at that time was in charge of that branch.

Today the Bureau of Mines has ten rescue cars, five rescue trucks, and eight safety stations distributed throughout the mining regions of the United States, equipped with some 300 complete sets of such apparatus, while several thousand sets are owned by State mining departments and mining companies having rescue crews trained in their use.

Breathing apparatus may be divided into two types as regards the length of time the apparatus will furnish pure air on one charging; these are the half-hour type, principally used on vessels or where men are only exposed to dangerous atmospheres for short periods of time, and the two-hour type which is the kind used in mines. In mine rescue and recovery work the apparatus wearer may have to travel considerable distances from his base and two hours has been adapted as the maximum period of service compatible with lightness and convenience of portability. Only the two-hour type is considered in this paper.

In the United States there has been a steady growth in the use of breathing apparatus by the mining industry. As with many other new devices when they first appear mine operators and owners were at first decidedly skeptical as to the merits of the apparatus. However, owing to the progressive spirit of numerous operators, both coal and metal, the ingenuity of apparatus manufacturers, and persistent effort of the Bureau of Mines, a more intelligent understanding of the use and limitations of the apparatus has been attained.

As a result of the combined efforts of those appreciating the necessity for such a device penetrating

New Laboratory of the U. S. Bureau of Mines opened for the Research Work in Mine Safety, 29th September 1919.

noxious atmospheres, a tremendous impetus has been given to its use in the mining industry, especially within the last three or four years.

I believe that all of you will agree that the apparatus occupies an essential and permanent position in the mining industry, so it does not seem necessary at this time to point out instances where lives have been saved directly by the use of the apparatus, or to give even approximately the figures showing the value of the vast amount of property saved to the nation annually.

Today there is not a mining district in the United States that cannot on short notice in time of disaster obtain the services of trained men equipped with apparatus either from State or privately owned rescue stations or from the Bureau of Mines. Also, most of the larier companies have rescue equipment and organized safety crews.

On account of the constantly increasing demand for apparatus training, the Bureau of Mines has for some time appreciated the necessity for standardized course of such training.

Thorough and systematic training are essential to insure the safe and economic use of the apparatus. Such training can best be insured through standardization of training methods. As a result of a standardized course, it is believed that more attention will be paid to the selection of the proper type of men for rescue crews, efficiency will be increased, and higher appreciation of the value of the apparatus will result.

The reasons for standardization are, in fact, so obvious that it hardly seems necessary to dwell further on this phase of the subject. It might be mentioned, however, that there are two essential reasons, in addition to those already mentioned, for such standardization.

(1) It is policy of the Bureau of Mines, upon request, to give a thorough examination to men trained either at privately or State-owned rescue stations, with a view of qualifying them for mine rescue certificates as issued by the Federal Government. A standard course of training would most assuredly be tremendously advantageous to both the examiner and the examined.

(2) Trained men going from one mine to another mine would be decidedly at a disadvantage when called upon to wear apparatus, assuming that the men at each mine had received a different course of instruction. This would hold true even though their training had been with the same type of apparatus. As an illustration, it has been known to occur that where one instructor would require vacuation of the apparatus of all normal air, another would require the inflation of the breathing bag with exhaled air, while another would permit the wearer to don the same type of apparatus containing normal air. Such diversity of instruction may result in serious difficulty for the wearer.

It is believed that a course similar to that pursued by the Bureau of Mines in the standardization of first-aid instruction should be followed in this case, i. e., by the wide dissemination of a publication on the subject.

I will now attempt, without going into details, to give a few of the fundamental principles that might form a basis for such a publication.

On account of the extremely hazardous work of wearing rescue apparatus in deadly atmospheres, too much attention cannot be given to the selection of an apparatus and the training of the wearer.

Many of us are inclined to think of a course in apparatus training as so many hours under oxygen in an irrespirable atmosphere. In reality, this phase of the course, though essential, is second in importance to a thorough and scientific knowledge of the use and the mechanical and physiological limitations of the apparatus.

No one should be accepted for training without first receiving a thorough physical examination by a competent physician or surgeon.

The length of the course should not be less than five periods of four hours each. At least eight hours should be spent under oxygen and in an irrespirible atmosphere. Wherever possible the apparatus work should be given underground. The course should include standard lectures on each of the several types of apparatus now in use in this country. Such lectures should dwell at length on the verious tests of the apparatus, in order that the wearer may know to a certainty that his apparatus is functioning properly before entering a zone of poisonous gases. A person to be skilled in the use of apparatus should not only have a thorough knowledge of the use and care of the apparatus and oxygen pump, but he must also have a working knowledge of mine gases, that is, he should be familiar with their methods of occurrence, physical properties, effects on man, and methods of testing for their presence, particularly those gases encountered after mine fires and explosions. Knowledge of at least two types of flame safety lamps is desirable on the part of the apparatus man trained for work in coal mines. This is not so essential in the training of metal miners. The standardized course should specify the purity and method of manufacture of oxygen to be used in the apparatus. Oxygen manufactured by the electrolytic process may contain a certain percentage of hydrogen. The Bureau of Mines has, therefore, tentatively specified to manufacturers who supply oxygen for use in mine rescue apparatus, that the oxygen shall not contain more than 2.5 per cent nitrogen nor more than 0.2 per cent hydrogen. Also the purity of the regenerating material should be specified.

In addition, the course should deal at some length with the method of procedure following mine fires and explosions, including the duties of the captain of the rescue squad.

Publication regarding such course of standardization is now contemplated by the Bureau of Mines.

The necessity for such standardization is now, I believe, universally recognized among the manufacturers and users of breathing apparatus. By the whole hearted cooperation of apparatus manufacturers, safety engineers and the mining public, such standardized training will be established and oxygen breathing apparatus made a safer and more efficient agent for the help of mine owner and miner in times of trouble and disaster.

An address delivered at the Eighth Annual Safety congress, National Safety Council, Cleveland, Ohio, by D. J. Parker, Mine Safety Engineer of the U. S. Bureau of Mines.

Special Correspondence

BRITISH COLUMBIA.

Victoria, B. C.

The possibility of an iron and steel industry being established in British Columbia has been the subject of animated discussion since the publication of the report that large and rich deposits of limonite have been located in the Whitewate River District, some distance from the town of Lillocet, B. C. J. H. Hawthornthwaite, M. P., who is interested in the properties and who made a trip into the Interior to inspect them, goes so far as to say that there are now assured to this Province "blast furnaces, rolling mills and all other necessary accessories to the operation of a great steel plant." Mr. Hawthornthwaite, with whom were competent engineers, gives it as his belief that the region lying between the Klino on the north of the Chilco Lake on the south, a distance of nearly one hundred miles, contains the largest known exposure of iron ore. He says that such a large deposit of high grade iron ore, including hematite, limonite, and ironstone, cannot remain unused for long. Small mountain ranges, he says, can be seen in all directions which are literally clothed with iron from the summits down to far below the timber line. As to transportation he explains that a comparatively short spur line would furnish connection with the Pacific Great Eastern Railway, and thus provide a ready means of access to the coast. While Mr. Hawthornthwaite would like to see the Provincial Government take hold of the property, develop it, and back financially the launching of a steel industry he declares that "no difficulty whatsoever will be experienced in commencing operations at once by the introduction of outside capital. "If the same energy is displayed, "continues this member of the Provincial Legislature" in prosecuting this enterprise as was expended in carrying on the war it should be possible to have the project well underway within thirty days. Where the rolling mills and subsidiary plants will be placed is, of course, a matter for careful discussion and investigation. But I am of the opinion that there can be no question that Ladysmith offers an ideal location for the establishment of blast furnaces. Two great corporations are engaged in that neighborhood in mining the finest coke producing coal to be found on the Pacific Coast. A coking plant in connection with these mines could be readily and economically established which, together with the blast furnaces, would provide labor for several thousand men. Thus would a long step be taken towards solving one of the problems that Vancouver Island, as well as the rest of the Province, will have to meet sooner or later.

The Nanoose Collieries Company, of which J. J. Grant is the managing director, owners and operators of the Grant Mine at Nanoose Bay, have sold their interests to the Nanoose-Wellington Coal Company, of which Lewis Williams, of Seattle, Wn., is president and with whom are associated other Washington State and St. Paul Capitalists. The property comprises approximately 1,700 acres, including submarine area, and it is the intention of the new owners, according to Mr. Williams, to immediately start operations to the end that the output may be largely increased. Construction work is to commence without delay, plans already being underway for new bunkers, a washer and other top equipment. Surface improvements and underground development will mean an expenditure of at least $100,000. The object said to be aimed at is to bring the daily production up to 500 tons as quickly as possible. John John, superintendent under the former owners, has been retained in the same position.

Stewart, B. C.

Sir Donald Mann, owner of the Big Missouri Group of Claims, in the Salmon River District, Portland Canal, which property is to be diamond drilled, is paying another visit , the second in six weeks, to the part of northern British Columbia in the mineral development of which he is so keenly interested. Coincident with Sid Donald's arrival there are many rumors of possible development, one of which refers to the construction of railroad from Stewart to the Big Missouri, which ambitious project is justified on the ground that an important discovery of gold-silver ore has been made on the Laura and E Pluribus Claims. Professor Bancroft, of McGill University, Montreal, recently left to inspect the Big Missouri and other claims in the district while F. H. Minard, of New York, ocnsulting engineer Sir Donald Mann, also is making an inspection of the pormer property.

Boyle Bros., diamond drill contractors, have started work on the property of the Forty-Nine Mining Co., Salmon River. The same company had taken a third drill into that section for work on a property, the name of which is not given. Boyle Bros. have the contract for drilling the Big Missouri.

P. Welch, of the John W. Stewart Contracting Co. and the Foley, Welch and Stewart interests, accompanied by his son, Lieut. J. A. Welch, of Spokane, Wn., has gone into the Salmon River Country to inspect the Mineral Hill Property. With the party were R. W. Martin and H. J. Fetters, who also are interested in the property, and Al. Harris, superintedent of development work.

Kaslo, B. C.

The equipment of the Silver Bell and Silver Bear Mines, situated on the south fork of Kaslo Creek, is being improved, a number of houses for the accommodation of the men having been completed. These silver-lead properties are being worked under the direction of W. E. Newton, mining engineer. They are controlled by R. F. Green, M. P., with whom is associated his brother, S. H. Green, of Kaslo, so far as the Silver Bell is concerned, and in association with Senator Clide Pringle, of Ottawa, in respect of the Silver Bear. The Silver Bell recently shipped a carload of rich ore to the Trail Smelter and ore still is being sacked from the upper workings of equally high grade, development proceeding simultaneously. The Silver Bear is being opened up and is reported to be showing promise.

Recoveries from the concentrator of the Cork-Province Mine, situated on the south fork of Kaslo Creek, have been running 51 ounces of silver and 67 per cent lead per ton of ore treated. A shipment of four cars of concentrates is being made to the Trail Smelter. Previous shipments made this year totalled 122 tons. The production of this property last year was 642 tons of lead-silver concentrates and 110 tons of zinc-silver concentrates.

F. J. Edwards, manager of the Index Mine on the south fork of Kaslo Creek, states that the installation of an air compressor at the Mine is complete and that two drills are in operation. Both machine and hand work is in progress. A long crosscut is being driven to No. 2 vein while a drift is being made on No. 1 vein from the intersection of the crosscut. Silver-lead is the chief content of the ore.

Merritt, B. C.

Joseph T. Knapp, who is in charge of development work at the Donohoe Mine, Stump Lake, reports that the work of unwatering the Josphua Shaft is making good progress and that active mining operations will be started as soon as the 200-foot level has been emptied. Air compressors are on their way and a new motor truck has been purchased to transport ore to the railway at Nicola. Mr. Knapp states that it is planned driving a long tunnel to crossécut the several planned driving a long tunnel to crosscut the several veins of the property. When it reaches the Joshua vein it will be some 1200 feet in length, cutting the latter at a depth of about 550 feet. It is expected that the tunnel will cut the Tubal Cain Vein at a distance of about 500 feet in and another, known to exist between that point and the Josphua vein. The Donohoe Mine ore contains values in gold, silver, lead and copper, its chief content value being in silver.

Alice Arm, B. C.

The Taylor Engineering Company is planning the erection of a 3,000 tons ore bunker at the wharf at Alice Arm to facilitate shipping. The railway is transporting 150 tons of ore a day from the Dolly Varden Mines to tidewater.

The Sweetwater Claim, situated across the river from the Dolly Varden, has been purchased by D. J. Hancock, who is interested in a number of other claims in the district. Mr. Hancock recently announced that all right, title and interest in the United Metals Company had been sold to him for $25,000 and that the only interest the stock-holders have remaining is the division of such moneys as has been and is to be paid by him on the property.

The La Rose Mine is taking out some good silver ore, two shipments having been made, one to Anyox and the other to the Trail Smelter.

Samples taken from the Climax Claim is reported to have assayed high in silver while rich ore of the same character is said to have been taken from the North Star Mine.

Barkerville, B. C.

For years E. E. Armstrong and other Cariboo prospectors have been searching for the motherlode which fed the placers of that district, from which many millions in gold were taken over fifty years ago. In the last year or so the quest resulted in discoveries of importance two quartz ledges being uncovered and traced for a distance of nearly 20 miles, the strike being northwest by southeast. Mr. Armstrong and his associates, F. J. Tregillus, J. H. Blair, and Pat Carey, prospected these ledges which are respectively 17 feet and 42 feet in width. Assays run from $17.50 to $19.00, while as high as $500 to the ton has been obtained. For a depth of 20 to 30 feet the ledge matter is much decomposed and the gold is free. By grinding a piece of the rock in a mortar and panning the powder fine gold is readily recovered in the decomposed material. Below that depth the ore tuns base and will have to be either concentrated and smelted or cyanided. No great depth has been achieved on the ledge, about 30 feet in one shaft being the greatest, but it will be prospected at depth and crosscut and tunnelled during the coming months on a large scale. Recently a deal was concluded by which eight claims were turned over for $250,000, the purchasers being Robert & Bryce, M. E., of Toronto, Ont. and associates, the former now being in the district with A. W. Newberry making preparations to commence work. Mr. Bryce already has located water and mill sites and a stamp mill will be installed next Spring for treating the free-milling ore. In addition to the claims involved probably 20 others have been staked along the zone.

Nelson, B. C.

As a result of a statement that the Canadian Consolidated Mining and Smelting Company of Trail, B. C. has been selling its lead at a low price to a subsidiary concern, thus treating the independent ore shippers unfairly inasmuch as all the lead produced at the smelter is pooled and sold in the best market, particulars have been given to Fred. A. Starkey, commissioners of the Associated Board of Trade of Eastern British Columbia, by the Company of what happened to the 205 lead shipments made during the months of April, May, June and July. For each of these bulk shipments the Company has made a tabulation giving the sale number, advice number, lot number, car number, weight in pounds, price per pound, amount of invoice, name of consignment and destination.

An analysis of the shipments made with reference to the consignees shows that the smelter had 21 customers during the four month period of whom nine received shipments in April, eight in May, fifteen in June, and eleven in July. Twenty of these customers were Canadian firms and one was American. The last named, the Pacific Orient Company, of San Francisco, received seventeen consignments in June for export, this being the only month in which it figured.

The five largest customers were: The Carter White Lead Company of Montreal, 50 shipments; The Northern Electric Co., of Montreal, 40 shipments; The Canada Metal Company, of Montreal, Toronto, Winnipeg and Vancouver, 25 shipments; Jas. Robertson & Co., of Montreal, Toronto and Winnipeg, 16 shipments; and the Steel Company of Canada, of Atwater and Montreal, 12 shipments. The other fifteen customers averages three shipments each, the destinations including, besides the cities named, St. Johns, Sherbrooke, Quebec, Hamilton, and Walkerville.

The average price for April was 5,452 cents per pound; May, 5.579; June, 5,556; July, 6,084. Shipments for the four months reduced to tons were: April, 675 tons; May, 1,456 tons; June, 3,278 tons; July, 1,334 tons.

A comparison between the New York prices and the prices that the smelter obtained shows that the Canadian purchasers of pig lead paid, and the lead ore shippers of the district received settlement at, a considerable premium over New York. This is shown by the following table:

Month.	New York	Average Sales of Consolidated
April	5	5.45
May	5.04	5.58
June	5.26	5.56
July	5.23	5.67

Thus, on the average, the Canadian shipper has received for his lead content, 44 cents more per hundredweight, or $8.80 per ton, during the four months, than the American shipper. But for the necessity of meeting the competition offered by cheap Mexican lead, and preserving the home market for the future, it is intimated that the advantage of price would be still greater.

On the upper part of Cascade Creek there are located the Comstock and Whitewater Groups of Mineral Claims, belonging to the Nelson Mining & Development Co., the E. & M. Mine, operated by P. Sheran, of Nelson, as well as other properties. This region was visited recently by A. G. Langley, Government Mining Engineer for the East Kootenay District, with a view to reporting on the prospects referred to and on an application from those interested that the government assist in the construction of a mining trail to the shipping point, namely, Bosworth, Trout Lake. The mining men claim that this will give them a shorter route with an easier grade and that the facilitate will very materially assist them. Mr. Langley visited the properties on which work is underway and it is reported that on the E. & M. a cross-cut now is more than 250 feet in, being well past the centre line of the boar's back on which the claims are situated. Less than 50 feet more is estimated as sufficient to cross-cut the nearer of the two parallel inclined veins, both of which were exposed in the 40-feet shaft which constituted the first development.

John McIntyre, of Fairview, B. C., a well-known prospector, has staked a silver claim within the limits of the municipality of the City of Nelson. This recalls to those who have reported the occurrence the early days when Nelson consisted of nothing more than a shack and two tents.

The road to the second Relief Mine is being restored. It was burned over on July 16. There are three bridges to be rebuilt.

The 6,000 foot wagon road being built from the California Mine to the Athabasca Mill by the California Mining Co., is through to the mine, although the work is not quite complete. The company propose employing motor trucks for the transport of the ore to the mill.

Trail, B. C.

Ore receipts in gross tons for the week from August 21 to 31 inclusive at the Canadian Consolidated Mining & Smelting Company's smelter, Trail, B.C., were 11,551. The largest shipment from any property, independent of those belonging to the company, came from the Mandy, of the Pas, Manitoba, with 1023 tons. There were no other large shipments from the independent operators but of the company's mines the Sullivan, Kimberley, contributed 7,467 tons and the Centre Star, of Rossland, 1,804 tons.

Ore receipts in gross tons for the week from Sept. 1st to Sept. 7th, 1919, inclusive, received for treatment at the smelter of the Canadian Consolidated Mining and Smelting Company, Trail, B. C., totalled 6,610, making the total tonnage handled to date this year 241,148. The largest independent shipper again was the Mandy, Le Pas, Manitoba, with 571 tons while the Quilp, of Washington State, was a close second with 442 tons. The Company's mines, of course, were heavy shippers. From the centre Star, Rossland, came 1687 tons and from the Sullivan, Kimberley, 2720 tons. The Sullivan Mine has passed the 100,000 mark for zinc ore shipments for the current year. During the same period the same mine has contributed a considerable tonnage of lead ore. A new shipper is the Silverite, of Alamo, recently taken over by Clarence Cunningham.

Greenwood, B. C.

The 100-Ton mill being installed at the Carmi Mine, situated 40 miles west of Greenwood, is making good progress. The foundations are being laid for a five drill steam compressor. This property has a showing five feet wide with an exposure of 1200 feet.

Vancouver, B. C.

Prizes were awarded competitors in the mineral exhibit of the Vancouver Exhibition, as follows:

Best exhibit of natural mineral salts, Basque Chemical Products.

For the best general exhibit of ores from any of the six mining districts—Gold medal to the Kootenay District, per Fred. A. Starkey; Silver medal, Portland Canal per Stewart Prospectors's Association.

For exhibit of ores from any mine or prospect from each of the six mining districts from which two or more exhibits are entered from separate properties in the competing district—Coast District, gold medal to the Drum Lummon Mines, Limited; Kamloops Districts, gold medal to Kathleen Groupe (Max Cameron).

Best exhibit of silver ore.—Dolly Vanden Mines.

Best exhibit of copper ore.—Drum Lummon Mines.

Best exhibit of gold ore.—Surf. Inlet Mines.

Best exhibit of copper-gold ore.—Drum Lummon Mines.

Best exhibit of copper-silver ore.—Bowena Copper Mines.

Best exhibit of products extracted from coal.—The Barratt Company.

Best exhibit of molybdenite.—Index Molybdenite Company.

Best exhibit of hand samples by individual prospector—1st, Gretna Group, Alberni District; 2nd, P. Gilboe, Spences Bridge; 3rd, McKinnon Group, Howe Sound.

Golden, B. C.

C. J. Lincke, superintendent of the Tarheel Copper Co., Limited, has imported a car-load of horses for use in mine work in the Golden district. The first use to which he will put them is the bringing out of a carload of ore, which is ready for shipment. It is expected to go 15 per cent copper. It is hoped to ship three carloads before the close of the season.

Winnipeg, Manitoba.

Of interest in British Columbia mining circles is the announcement that the Manitoba Government may built a 72 mile railway to furnish transportation facilities for the rich mines of the Pas, Manitoba. The Provincial Government, evidently, appreciates the necessity of such a work but thinks that it is the duty of the Dominion Government to take the initiative. The Canadian Pacific it is stated contemplates the construction of a line to the Pas and thence to the mining region but it is likely to be several years before this is done.—In the meantime the mines are operating under a heavy handicap, some shipping ore for smelter treatment to Trail, B. C., and handling it several times en route.

NORTHERN ONTARIO.

The Gold Mines.

Position of Hollinger Consolidated sufficiently good not to require exaggeration.

The "Financial Post," Toronto, in a recent issue contains information which does not find corroboration in actual facts. It says, regarding the Hollinger Consolidated: "Hollinger, it is said, will increase its "dividend rate from one per cent a month to five per "cent quarterly at the turn of the year. There is about "$5,000,000 in the company's cash reserve, and it is "likely that a substantial part of this will be divided "among shareholders in the shape of a bonus around "Christmas time. The shares are selling between $6.50 "and $7 now and there is said to be a pool working "to get control of all the stock available. The ore re- "serves of the Hollinger property are estimated by the "company's engineer at $50,000,000, while other min- "ing men say that $80,000,000 would be a conservative "estimate."

The actual facts are these: Hollinger surplus as of June 17th, last, was officially stated to be $2,853,043.92. Of this $781,756.91 was added during the first half of this year. The indications appear to be that the surplus may exceed $3,500,000 by the end of this year. Dividends are not being disbursed at the rate of one per cent a month. A disbursement of one per cent is made every eight weeks. The ore reserves have never been officially estimated at $50,000,000, the official estimate at the beginning of the year was a little over $41,000,000. Further, if other mining men estimate ore at $80,000,000 such an estimate is not to be relied upon. The estimates of the management have always been found to be exceedingly reliable.

The Hollinger Consolidated has taken its place as the leading gold mine in the Western Hemisphere, and appears about to make a strong bid for world leadership. It would seem a pity were ridiculous statements to get abroad that might confuse the actual strong physical condition of the mine and the conservative policy of the company with claims that are at once irresponsible and not true.

The Dome's Position.

The Dome Mines had close to ten million dollars in ore blocked out as of March 31st, last. The gold content of the ore is estimated to contain between $5 and $6 to the ton, the 1918 figures being $5.10 to the ton. The milling equipment is adequate to treat an average of about 40,000 tons monthly, or at the rate of approximately half a million tons annually. It is therefore evident that ore already in sight is sufficient on which to operate present milling equipment at full blast for a period of four years. This estimate takes into consideration the ore blocked out above the 700-ft. level. All that zone lying below the 700 and down to a depth of close to a quarter of a mile is omitted from the estimate for the reason that although sinking has been carried down to that depth, yet sufficient lateral work does not appear to have been done to determine the volume of the ore. The Dome is the second largest gold mine in Canada, being second only to the Hollinger Consolidated. Operating at full blast it should produce at an average of not far under a quarter of a million dollars a month, or perhaps close to three million a year. The company is capitalized at 500,000 shares of the par value of $10 each. Some 400,000 shares, or $4,000,000, have been issued. The indicated output, therefore, is close to seventy-five per cent of the issued capital. Allowing two- thirds to be consumed in costs, the remaining one-third would represent about twenty-five per cent net profit on the company's issued capital.

The McIntyre Report.

The recently issued annual report of McIntyre Porcupine Mines, Ltd., covering the year ending June 30, 1919, is of more than ordinary interest. Developments at the mine during the year resulted in the opening up of very large bodies of ore of good grade. There have been numerous reports and rumors concerning these developments and it was generally known that the ore deposits were proving to be better at depth than near the surface. The official statement shows that these favorable reports were well founded.

Manager Ennis presents a report that should delight the shareholders and at the same time increase the faith of the public in the mineral resources of Ontario. The development of No. 5 vein on the 1,125-ft. level of the McIntyre is an event of great importance in the history of gold mining in the Porcupine area. When Mr. Ennis made his report the vein had been opened up 900 ft. and showed an average width of 9.5 ft. and assayed $18 per ton. If such ore extends even a short distance below the drift it will yield a very large tonnage of ore that can be mined at a profit of about $12 per ton. If such ore continued to the 1,250-ft. level there would be in this small section of the vein 90,000 tons that would contain $1,620,000 in gold that could be recovered at a profit of over $1,000,000. With such possibilities ahead, and with the demonstrated facts concerning the ore above the 1,125-ft. level, the operators can well look hopefully to the future.

The ore reserves as of June 30th were estimated at 433,057 tons, containing $4,777,324, the assay value of the ore being estimated at $11 per ton. Assuming operating costs to be about $5 per ton, this ore should yield a profit of roughly $2,500,000. There is very little said in the report as to the exact location of this estimated ore, and there are no stope maps with the report. The estimate can mean little therefore, except supplies, 12 cents; power, 22 cents; timbering, 18 contained in the report. It seems probable, however, that the company's biggest asset is the ore of unknown value—the yet undeveloped ore. The really important information given in the report is Manager Ennis's statement that "the 1,125-ft. level is opening up in a very satisfactory manner, showing a more continuous length, width and average grade of ore than any previous level opened up in the property."

Operating costs at McIntyre mine.—The McIntyre produced in the year ended June 30, 1919, 179,874 tons ore of which the gross value was $1,755,059. The operating expenses totalled $914,779. The average value per ton was $9.76, and the average cost $5.09 per ton.

The cost of mining the ore was $2.89 per ton, including 82 cents for development and 5 cents for exploration. Crushing and concentration cost 16 cents; milling, $1.01; repairs to buildings, etc., 6 cents; heating, lighting, etc., 27 cents; head office, 22 cents; mine office, 19 cents; taxes, insurance and workmen's compensation, 22 cents; marketing bullion, 4.6 cents, and examination of prospects 1.6 cents.

Mining costs.—An analysis of the mining costs shows that the labor cost $1.14 per ton; explosives, 38 cents; supplies, 12 cents; power, 22 cents; workshops, 1.3

cents; rock drill maintenance, 6 cents; workshops, 1.3 cents; hoisting, 35 cents; sharpening steel, 8 cents; pumping and ventilating, 9 cents; assaying and sampling, 7 cents; superintendence, 4 cents; surveying and engineering, 6 cents, and general charges 1.2 cents.

Milling costs.—An analysis of milling costs shows that labor cost 20 cents per ton; supplies, 61 cents; power, 17 cents, and workshops, 3 cents.

The cost per ton for crushing and elevating was 2.5 cents; ball mills, 19 cents; classifiers and tube mills, 19 cents; reagents, 19 cents; agitators, 5.6 cents; thickeners, 3 cents; clarification, 3 cents; precipitation, 15 cents; pumping and elevating, 3 cents; refining, 9 cents, and assaying, 1.5 cents.

The mill treated 179,874 tons ore during the year. The recovery was 95.2 per cent.

The McIntyre shaft.—Results at depth are so encouraging at the McIntyre mine that it is proposed to proceed steadily during the coming year with the sinking of the main shaft, which has now reached a depth of over 1,400 ft. Levels will be established at each 125 ft. Stations have been cut at 1,125, 1,250 and 1,375 ft. Ore and waste pockets will be cut at the 1,375 ft. level and a haulage level established to handle the ore from ore passes raised to the 1,250 and 1,125 ft. levels.

More Hollingers.—Mr. A. F. Brigham, manager of Hollinger Consolidated Mines, is optimistic as to the future of gold mining in Northern Ontario. Mr. M. O. Hammond of the Toronto "Globe" quotes him as saying: "A country covered with bush and muskeg like this, that has one Hollinger on it, has every chance of having several more Hollingers."

There is much more bush than muskeg in Ontario gold areas, but we agree with the idea conveyed in Mr. Brigham's remarks. The Hollinger out-crops are inconspicuous enough now that the forest has been cleared, but the place where the Hollinger buildings now stand was ten years ago a "dirty bit of tangled forest." Where the stamps now roar almost unceasingly there was little to attract the prospector. Fortunately, gold quartz was found and the great Hollinger mine has taken the place of an uninviting tract of the forest.

When one considers that only a very small part of rock surface is exposed, it is easy to agree with Mr. Brigham that there may be many more Hollingers yet undiscovered.

Developing gold at depth.—There is much encouragement for Ontario gold mine operators in the recently issued report of the manager of the McIntyre mine. At the lowest level, 1,125 ft., there has been developed the best and biggest stretch of ore yet opened in the mine.

This announcement is not only of interest to shareholders of the McIntyre. It is of importance to all who operate gold mines in the Pre-Cambrian areas of Ontario. There has been too much pessimism as to the downward extension of Ontario gold deposits. There is no sound reason for the frequently quoted "surface enrichment" so far as our glaciated Pre-Cambrian areas are concerned. The present surface should be taken as a fairly representative horizontal section of deposits that may continue to great depth.

Men needed at gold mines.—While good progress is being made at the big gold mines of the Porcupine area, there is still reported to be a shortage of miners at the Hollinger and Dome mines. Several hundred additional men could be used to advantage at these properties.

Prospecting Kirkland Lake area.—Mr. Percy E. Hopkins of the Ontario Bureau of Mines, who has been until recently working in the Kirkland Lake area, states that a good deal of prospecting has been done this summer. There are more prospectors at work in the area than for several years. Mr. Hopkins and Mr. A. G. Burrows are making a detailed geological map of the area. Mr. Hopkins is now at the Shiningtree area and Mr. Burrows at Matachewan, but both will return to Kirkland Lake area soon. Mr. Burrows will first visit the Gowganda area.

THE SILVER MINES.

All Leading Mines Again Operating at Cobalt.

The Nipissing mine resumed production Sept. 24th. This makes it possible to state that the leading mines of the camp are once more fully operating. The recovery from a camp closed and partially flooded mines at the end of the first week of September, to a normal state of operation before the close of the month, is a tribute to the efficiency of the managerial staffs.

Owing to the extensive underground workings of the Nipissing having been partially flooded the general impression had been that anything like normal operations would not commence before the first week in Oct. Now, as matters stand, the entire workings will be completely dewatered by about October 5th.

The Mining Corporation has again attained full capacity. A greater number of stamps are being operated today than during the period preceding the strike. This would seem to indicate a likelihood of the company being able to make up for a large part of the time lost.

At the Beaver Consolidated, operations are proceeding at capacity and marked success is stated to be resulting from development work. It is learned that considerable high grade ore is being taken out, a fair quantity running several thousand ounces to the ton.

Work for the time being is confined to between surface and a depth of about 700 feet, the latter level being in the diabase sill. For the present, no work is being done in that zone lying below the diabase sill and at a depth of between 1,600 and 1,700 feet.

The indications appear to be that the Coniagas mine will produce about 800,000 ounces of silver during the current year. The mine resumed operations at full capacity during the opening days of the second week of September and is in a physical condition to speed up production to such an extent as to almost make up for the loss of time incurred by the recent labor strike.

Production for this year bids fair to average about 67,000 ounces monthly, worth, at the present price of silver, about $75,000. It should, however, be kept in mind that during the first few months of the year the price of silver averaged about $1.01 an ounce and that production evidently averaged about $67,000 a month.

Last year the cost of producing silver averaged about 34 cents an ounce. Including all charges for marketing, etc., the total cost approximated 40 cents an ounce. Taking everything into consideration a slight increase

in the cost of production appears probable. Opinion appears to be that profits may average about 60 cents an ounce or about $480,000 for the year.

Assays taken from the new vein recently opened up at the Adanac showed a silver content of 112 ounces to the ton, according to official information. The vein continues to appear promising.

During the week ended September 26, three Cobalt companies shipped an aggregate of sixty cars containing over half a million pounds of ore. The Buffalo was the heaviest shipper. A summary follows: Buffalo, 3 cars, 291,165 pounds; McKinley-Darragh, 2 cars, 172,125 pounds; Nipissing, 1 car, 85,873 pounds. During the corresponding period the Nipissing and the Mining Corporation made heavy shipments of bullion, the Nipissing sending out considerably over a quarter of a million dollars. In addition to this the Nipissing sent out over 200,000 ounces at the end of last week. Following is a summary of this week's shipments: Nipissing, 170 bars, 225,587 ounces; Mining Corporation, 68 bars, 68,603.99 ounces. With quotations for silver not far under 1.20 an ounce the week's silver shipments from Nipissing and Mining Corporation had a value of not far under $350,000.

South Lorrain District.

Interviewed this week, a property owner in the South Lorrain district expressed himself as being quite optimistic over the outlook in that area. He emphasized the fact that the activity in South Lorrain occurred at a time when quotations for silver averaged between 50 and 60 cents an ounce as a consequence of which effort was directly almost entirely toward the mining of high grade ore. Now, however, conditions have changed. Ore that formerly would have barely paid for operating expenses would now constitute a big source of revenue. For illustration: Ore containing twenty ounces of silver to the ton would then have been worth only about $10 a ton with costs amounting to the value of the silver. Now, with silver quoted at about 114 cents an ounce such ore would be worth $22.80 a ton, about one half of which would be net profit.

The opinion was expressed that the Keeley mine even now gave evidence of probably yielding a substantial amount of low grade commercial ore, and that in due course a revival of activity appeared likely. He predicted that the next year would see added attention being directed to the area, and presented the greatly increased price of silver as his chief contention for believing that favorable results might reasonably follow.

Elk Lake News.

The Ontario government is being severely criticized for the slow progress made in building the macadam road from Elk Lake to Gowganda, Of the 28 miles, only about two miles have so far been macadamized. Prior to the past season the government has spent close to $200,000 on this road, and, at the present rate, at least an equal amount will be required to complete it

Activity in the Elk Lake field is increasing. Work at the Paragon-Hitchcock is being carried on at the 200-ft. level with more or less encouragement. It is reported locally that there are some prospects of the Beaver Consolidated again resuming work on the Beaver Auxilliary, where work was suspended at the outbreak of the war. The Kells claims on which considerable silver is showing on surface are the object of more or less competition among prospective buyers. In other directions, also, there are gathering signs of renewed activity throughout the district.

According to advice coming from the Gowganda district, a promising silver find has been made on surface at the Castle property of the Tretheway Company.

An option held for some time by Col. H. McKee and J. Auger on the Silver Alliance property near Elk Lake has been turned over to T. J. Flynn, and arrangements are to be made to carry on exploration work.

Gen. Morrison, of Ottawa, is in the Elk Lake district looking over the property of the Northern Mining Company with the object in view of making arrangements to commence exploration work in the near future.

The Ontario Government will build a road from Elk Lake to Mountain Chutes on the Montreal River, according to information just received. It is learned that the work will be of the usual kind, that of clearing and grading.

The Late Charles O'Connell.

Charles O'Connell, one of the most widely known mining engineers in Northern Ontario, died at his home in Halleybury on Saturday, last. He had been seriously ill for but one week, although suffering from heart trouble for the past several years. He was interred in the Haileybury cemetery on Tuesday.

Mr. O'Connell was one of that old school of mining engineers who in all mining operations which he managed during the past fourteen years in this country commanded the deep respect of all those in his employ. It was characteristic of him to always look at the optimistic side. To him the pessimist seemed quite out of place in the North country. Due to keen human interest shown toward his wide circle of friends, Mr. O'Connell's passing leaves a vacancy in this mining district which is regretted, yet cherished by those who at one time or another were privileged to call him their chief.

In every sense of the word he was a genuine and an invaluable pioneer. The early days of Cobalt, the first actual mining operations in the Kirkland Lake camp, and the first mining development in the Boston Creek field bear ample testimony of this.

He died at the early age of 47 years, and was buried by the Masonic Order of which he was a member in the highest standing. His wife and three children survive.

That it behooves all those who wish to offer stocks or bonds for sale in Ontario to make a careful study of the Ontario Company's Act is made exceedingly clear by Attorney General I. B. Lucas. It is pointed out by Hon. Mr. Lucas that in the past there have been many legitimate offerings of stocks and bonds, but with failure to comply with the provisions of the act as to filing prospectus and giving information in all advertisements, as required by the act. It is evident, therefore, that not only the doubtful propositions will come under the scrutiny of the authorities, but all offerings will be dealt with without any evidence of partiality. The matter is one of vital interest to a veritable army of shareholders, and appears to be meeting with the genuine approval of mining men of the north in general.

Labor Situation.

The membership of the Cobalt Miners' Union is rapidly falling off, and evident signs of lack of confidence in the present executive of the union are noticeable. The resentment of the mineworkers against the strike leaders is natural, as there was

never any doubt but that the strike call was unnecessary and was bound to result calamitously.

It is reported that the Kirkland Lake strike will continue as the result of a majority of 15 votes in a poll of 125 votes. If these figures are correct, taken in conjunction with the isolated and ill-advised nature of the strike, it is only possibly to feel sorry for those "non-combatants" on whom the brunt of the suffering will fall during the coming Winter. It is already probably too late to expect a resumption of work in this camp until next Spring even were the men to decide to resume work at once.

NOTES FROM PORT ARTHUR AND LAKE NIPIGON DISTRICT.

Mr. J. C. Bateman, of the LaRose Mine, Cobalt, has been making preliminary exploration of the old Beaver Silver Mine.

A. J. Jaskson has placed six silver claims, located near Schreiber, under option to the Mining Corporation of Canada, after an inspection by their representative Mr. Hughes. The Mining Corporation are gradually extending their investigations in this district.

The Dominion Mineral Resources Co. Limited are making good progress at Silver Creek, are planning an active winter operation.

The Nicholls Chemical Co. have re-opened their mine at North Pines, and will employ over four hundred (400) men.

Preparations are also being made by the company to open up the property at Mokoman, twenty miles west of Port Arthur, which they purchased from Bruce Morrison.

The expenditure as planned, will be considerobly over a million dollars, and will establish this immediate district as a strong factor in Iron Pyrite production.

Mr. Hitchcock, representative of Smith and Traverse of Sudbury, who have the contract for diamond drilling on the Peter Leitch iron claims, east of Lake Nipigon, has been spending a few days in Port Arthur, accompanied by Mr. A. K. Walch of Detroit who holds the option on these claims.

The preliminary diamond drilling results have been satisfactory and Mr. Walch has renewed his option, and has arranged for an extensive program of diamond drilling and exploration.

In this connectiin the development of the Nipigon for power purposes is important. At the present time the Hydro Electric Commission are engaged in the development of Cameron Falls on the Nipigon, at an expenditure of four million dollars. The power is to be transmitted to Port Arthur and Fort William and is thus made available for mining purposes in the district.

At Schreiber over three hundred claims have been staked in the last month as a result of a new gold and silver discoveries. A good deal of work is being done and a number of outside capitalists have visited the district, and secured options on promising properties.

SILVER MINING IN THE THUNDER BAY REGION.

The expected revival of silver mining in the Thunder Bay region is gradually becoming an accomplished fact. While the plans of the mining corporation have not been announced, its representatives are still securing options and conducting preliminary investigations. It is believed that within the near future they will equip two or more properties and start production. The Canadian Mineral Resources Company, Limited, with headquarters in Toronto and Winnipeg, have begun work on the Silver Creek property in the Rabbit Mountain area. In the same area, a Chicago mining operator has employed a small gang for the whole summer with most encouraging results. In the west end area, approximately fifteen miles to the southwest of the Rabbit Mountain, three groups of claims will be opened up within the next fortnight.

While the reaction has been slower than had been hoped, there seems now to be no question at all that steady progress will be made.

A significant fact is that both United States and Canadian investors are competing for control of certain sections. It is quite natural that, in the circumstances, the persons interested do not wish to encourage public announcement of their activities.

THE OUTLOOK FOR COAL EXPORTS FROM THE UNITED STATES AND CANADA.

Mr. George S. Rice, Chief of the Mining Division of the U.S. Bureau of Mines, has made the following report on the prospects of coal export business from United States' ports to Europe. In this connection what is true of the United States is also true of Canadian coal districts on the Atlantic coast, and some indication of the European demand is to be seen in the recent shipments of coal from Nova Scotia for Scandinavia, Italy, France and Holland, and the prospect that further shipments will be sent to Mediterranean ports, including the Levant.

So far as the supplying of its own requirements is concerned, the problem of the United States is not one of coal production, but primarily one of transportation. The coalfields of the United States are so vast, and so accessible that they can be developed to any extent desired, provided sufficient labour can be obtained.

The existing situation strikingly corroborates the soundness of the policy of those who developed the Montreal market for Nova Scotian coal. These pioneers of Canadian coal export perceived that cheap transportation was a deciding factor in the obtaining of entrance into foreign markets, and they provided the type of vessel most suited to large scale coal transportation. Unfortunately, the demands made on British shipping by the war nullified the endeavours of these far-seeing men, and prevented advantage being taken of the present European situation to the extent that would have been possible had shipping been earlier released from requisition.

The stronger position now occupied by the mercantile marine of the United States is a factor just as important at the present juncture as that country's ability to furnish the coal at the shipping port.

Mr. Rice's Report.

The coal situation in Europe was brought prominently before the public by a meeting of the Supreme Economic Council in London, at which a warning was given by Mr. Hoover, that Europe's coal production was 35 per cent below normal, and according to the press dispatch, Mr. Hoover stated, "That England's annual coal production has fallen from 292,000,000 tons in 1913, to 183,000,000 tons and Germany's decline is slightly greater." "Europe," he added, "at the present rate will produce 443,000,000 tons next year, while the amount needed is estimated at 614,369,000 tons." Following this meeting, shipping and fuel representa-

tives of France, Belgium and Italy conferred with Mr. Hoover in Paris, and decided to urge the Supreme Economic Council to appoint a European Coal Commission to co-ordinate the distribution of European coal, in order to avoid what threatens to be a disaster. Mr. Hoover declined to accept the permanent directorship of the Commission, stating that "he believed the problem to be strictly European, and that the situation cannot be relieved materially by the slight help which the United States can give." It is thought that Mr. Hoover wished to spur the Europeans to put forth their utmost endeavors to meet the dangerous situation.

Without fuel, the railroads cannot transport food and produce; factories are closed both because of inability to get fuel and inability to ship their product. The United States is vitally concerned in helping its principal allies, both from an economic and humanitarian standpoint, and whatever coal as can be sent, will be of the greatest benefit, and perhaps ward off disastrous conditions. Many persons of the United States, on account of the impending shortage of fuel next winter, feel it is unwise to encourage export business, but winter shortage in the United States usually is very temporary in times of peace, and except from November to February, there is ordinarily no difficulty in supplying home needs. From March to September, the bituminous mines usually work only part time. If during the slackest periods in the Appalachian fields, coal could be loaded for shipment abroad, it would both improve the financial status of these mines, and also help in the shortage abroad, which is going to continue for a long time.

The principal causes for this shortage abroad are:

(1) Strikes to improve conditions;
(2) Individual absenteeism from the mines;
(3) Shortening the hours of labor;
(4) Lowered individual effort;
(5) Shortage of mine supplies on the continent;
(6) Insufficient railroad trucks and poor train service on the continent.

The first four of these causes are due to the world-wide labor unrest which affects even the native labor in South Africa, according to a recent address of the retiring president of the South African Institution of Engineers, in which he states that in his group of mines the output per native has fallen 30 per cent since 1914. In Europe, the writer observed during his recent visit, that there is a very general feeling among the miners that they are not willing to go back to the old order of things in the matter of low salaries, housing and other conditions, this feeling is particularly acute in Great Britain.

In Great Britain, on July 16th, 1919, there went into effect the so-called Sankey award, which shortened the hours of labor from 8 to 7, not including the average time of lowering and raising the workmen, but including the time he takes in travelling to and from the working place, the mine owners contending that with the 7 hour work day, there was less than 6 hours effective work performed. While to some extent, this might be taken care of in the future, by increasing the number of employees, there are no unemployed miners at the present time, and moreover the workings which are laid out for the longwall system, would not provide places at the working faces. This with the other causes has lead to a tremendous slump in the production in Great Britain, and it is now a question of how long England will be able to supply its former export trade markets. In 1913, the exports were 77,000,000 tons (2240 lbs.). Unless there is serious restriction of home industries and consumption of coal, there will be little or no coal available for export.

In France, the fuel conditions continue serious. There is a loss of 20,000,000 tons output of the mines wrecked by the Germans, which has not been made up by imports from Germany or the Saar fields where the normal output of 17,000,000 tons per annum has been reduced to about 35 per cent by reason of less efficiency of the miners, claimed in part due to poor feeding.

It was expected that Westphalia, when peace had been made, would at once respond, and resume its former large production, but strikes and labor troubles have continued, and there is a most serious shortage of coal so that the remarkable situation is found of coal being imported from the United States to Switzerland and now going up the Rhine on barges through the great Westphalian fields. Sweden, Denmark, and The Netherlands continue to receive coal from the United States, though normally, all the Baltic ports should be supplied by English coal. France and Italy are also importing from the United States.

Great interest is now manifested in the various trade journals of the United States in the export business. The large exporting companies have their own facilities for handling the business, but many of the smaller operators are desirous of getting into this lucrative business, but the greatest difficulty arises first, in getting the allocation of ships, second, in arranging the matter of payment by the foreign consignees, and third, in agreement as to grade and quality of coal.

It would appear that one very important thing must be done,—the establishing of standardized methods of taking samples and making analyses. At the present time, the U.S. Bureau of Mines is sampling and analyzing American coal purchased by the Swiss and Holland governments. It would seem desirable that similar standardized methods should be followed in shipments to commercial foreign buyers to guarantee the quality of what they receive, owing to the very great differences in the kinds and quality of coals heretofore used abroad, as compared with those obtained from this country, and also because of the varying methods of sampling, analyzing, and the interpretation of results.

PROF. STANLEY GRAHAM GOES TO N. S. TECHNICAL COLLEGE.

Prof. Stanley Graham, graduate of the faculty of applied science, at Queen's University, who has been acting as professor of mining at Queen's during the absence of Prof. J. C. Gwillim, at the coast, for the benefit of his health, is leaving for Halifax, where he has been appointed to the department of mining, at Nova Scotia Technical School.

MINING EXPOSITION PROGRESSING IN NEW YORK.

From present indications, the International Exposition of Mining Industries will open in Grand Central Palace, New York City, on October 15. Originally, it was planned to have the opening of this permanent exchange on November 1st, but the interest manifested in it by the mining industry was so gratifying and the list of prospective exhibitors so large that the date was set for two weeks earlier, at which time most of the other permanent industrial expositions in the Palace will be inaugurated.

All of these are being staged by the Merchants' & Manufacturers' Exchange of New York, which will

operate eight large expositions on the eight upper floors of the huge structure—the largest exposition building in the world. The four lower floors will be used for short term shows of various sorts, such as the annual automobile shows, flower shows, motor boat expositions, chemical expositions, etc.

This Mining Exposition is to be one of the most advanced steps made in the industry since the war ended. It is expected that by the opening date many machines will be shown in actual operation on the floor. The exposition will occupy 50,000 square feet of space and will include a most comprehensive display of modern machinery used in the development and exploitation of metal mines, non-metal mines, and oil wells, also machinery used in the subsequent extraction, reduction or refining of the raw products by concentration, leaching, cyanidation, flotation, smelting, distillation, coking, etc.

Howard R. Ward, manager of the International Exposition of Mining Industries, has been making an extended tour through the mining centers, including all of the Colorado territory, has returned to New York City to prepare for the opening. He is being assisted by an able staff.

The Nemours Trading Corporation, of which Alfred I. du Pont is president, owns and controls the Merchants & Manufacturers Exchange of New York. It has branches in all of the leading cities of the world, consisting of 19 branch offices and 3,000 foreign selling agencies.

Visitors at the Mining Machinery Exposition will also find the other expositions in this building of considerable interest. Included among them are the International Factory Appliance Exposition, International Farm Tractor and Implement Exchange, International Machinery Exposition, International Hardware Exchange, International Exposition of Municipal Equipment, etc. The advantages of this great world trade clearing house are obvious. Manufacturers will have their exhibits side by side affording easy comparison. Interchange of ideas and the opportunity to observe what is new and improved in machinery, will be of decided benefit to all who are connected with the industry. Then too, familiarity with the implements and machinery of one industry so often leads to appreciation of their applicability to another.

The offices of the International Mining Machinery Exposition are now installed in Grand Central Palace, and all communication should be addressed there.

BRITISH IRON & STEEL INSTITUTE CONSIDERS FUEL ECONOMY.

The Iron & Steel Institute at its Autumn meeting in London on the 18th and 19th September will consider the question of fuel economy, at which the report of the Committee on Fuel and Ores will be discussed. A joint report on "Fuel Economy in Steel Works" will be presented by Dr. W. A. Bone, Sir Robert Hadfield and Mr. A. Hutchinson (representing the Fuel Economy Committee of the British Association). A report will be read from Mr. H. J. Yates on "Fuel Economy in Foundry Practice." Messrs. Cosmo Johns and L. Ennis will read a paper on "Fuel Economy in German Iron and Steel Works."

This selection of subjects is significant of the chief problem that is today before the steel industry, namely the lessening of fuel costs.

TALC AND SOAPSTONE INDUSTRY IN THE UNITED STATES.

A meeting of the talc and soapstone producers, held in New York, August 12, 1919, it was voted to form an association to be known as the Talc and Soapstone Producers Association. About 90 per cent of the producing capacity was represented at this meeting either in person or by proxy. The purposes of the association, broadly speaking, are the betterment of the industry, both technically and in a business way, and the promotion of a spirit of mutual cooperation and solidarity. An important phase of the meeting was the discussion of the need of a revision of the tariff on talc. A committee was formed to investigate the matter and take whatever action necessary. After some discussion of the objects of the association, organization, problems for investigation and similar matters, a committee on permanent organization was appointed for the purpose of drawing up a constitution and presenting plans for the future work and conduct of the association.

The production of talc in the United States has increased about 90 per cent in the last ten years. During this period the production of ground talc has increased about 115 per cent. This indicates a great expansion in the use of this grade of material, and suggests the possibilities of even greater expansion under favorable conditions. These conditions can be brought about through technical research and publicity. Over forty uses for talc are now known, of which only a few have been exploited at all extensively. The principal uses of ground talc at present are in the paper plaint, rubber, roofing, and toilet powder industries.

Technical research in the production and utilization of talc should include both field and office studies. Some of the definite problems which are worthy of investigation are suggested below:

I. Field Problems:

Study of methods of mining to produce most efficiently a clean, dry product.

Study of most efficient methods of crushing and grinding, grading and sizing to produce a pure, clean, uniform product free from grit, and of good color.

Solution of detail problems of milling, such as the economy of dryers, the use of bagging or packing machines, etc.

Study of methods of utilization of talc in consuming industries in order to determine more accurately the most suitable grades and sizes for each use.

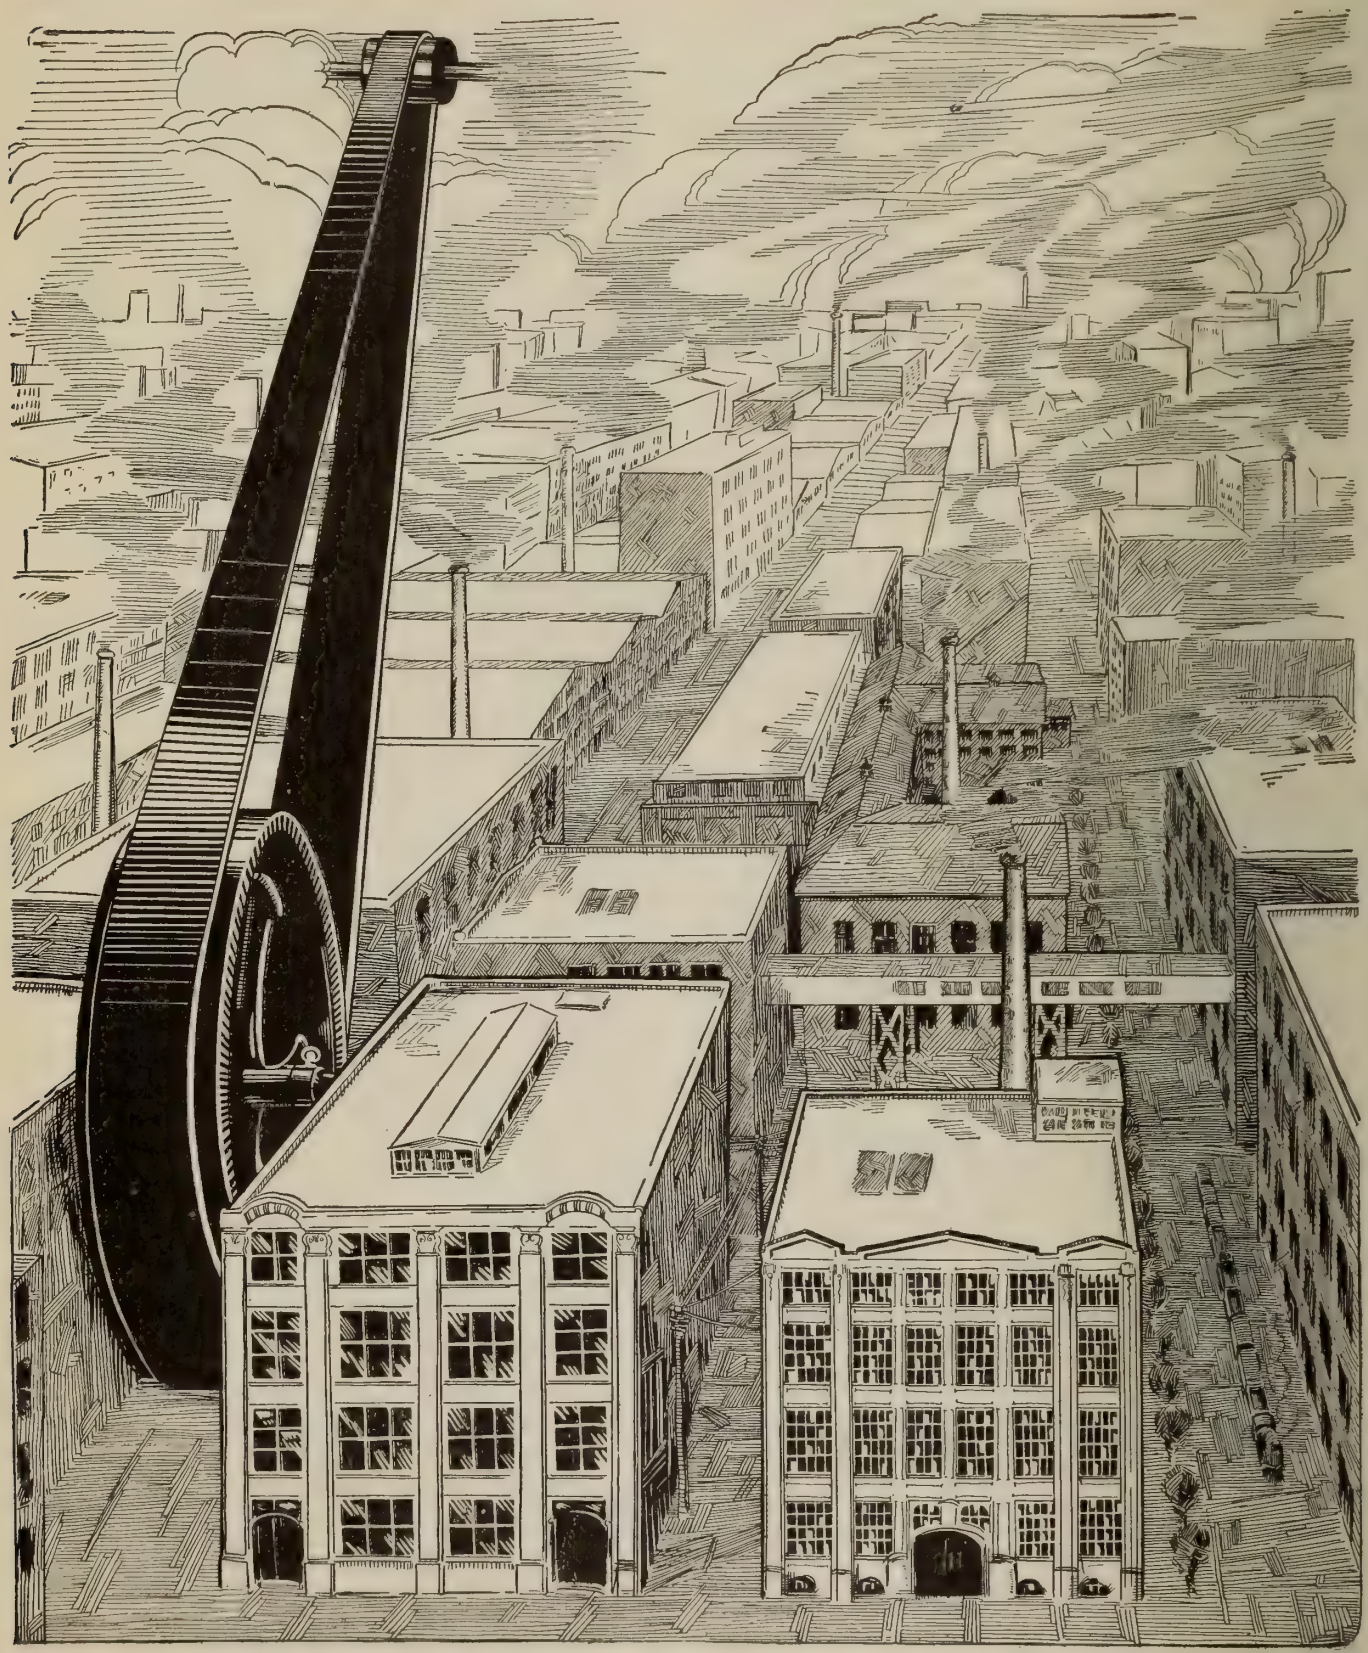
II. Laboratory Problems:

Study and tabulation of physical and chemical properties of tales from each producing district.

Study of behavior of talc in combination with other compounds in order to discover new uses: for example, a study of the colloidal properties of talc.

Standardization of grades, sizes, and tests so that uniform products may be marketed from different districts.

The solution of any or all of these problems would be of great benefit not only to the producers but to the consumers. The producers would benefit by the reduction of waste, increase of safety and efficiency, lower costs and wider markets, while the consumers would benefit by uniformity in grades and sizes and accurate knowledge upon which to base specifications and choice of the most suitable grade for each use.



EDITORIAL

QUANTITY COAL PRODUCTION IN BRITAIN COMPARED WITH THE UNITED STATES

"A dispatch from Manchester, England, "says that the repeated statement by trade "authorities that the pre-eminence of the "United States in the coal trade of the world "is due to excellence of mining machinery has "awakened the coal operators and miners of "the Manchester and Bolton districts. Elec- "trical and compressed air coal-cutting ma- "chinery, called "iron men" by the miners, "is being introduced very generally, one big "plant having recently installed an elaborate" "power plant in connection with the innova- "tion."

The foregoing, clipped from a New York coal-trade periodical, is just about the kind of information that the self-depreciative Englishmen distributes, and the United States reader will accept without gulping.

The pre-eminence of the United States in the coal trade of the world arises from the unparalleled extent and quality of its coal resources. The comparitive figures of production per man in Britain as compared with the United States which are so often quoted to prove the greater productivity of the United States' coal workers, are most misleading unless the physical conditions under which the coal is mined are also disclosed.

Coal is today being extracted in the United States under conditions more favourable than in any coal-field in any civilized country. In Britain, on the other hand, coal is being won under conditions of hardship that would in former years have been considered sufficient to prohibit profitable mining.

As to the use of coal-cutting machinery, it may be pointed out, as it has previously been pointed out in these columns, that coal is being mechanically cut and mechanically transported along the coal-face in English coal-mines today in seams that do not exceed sixteen inches in thickness.

The evolution of longwall mechanical coal-cutters and their use in thin seams is distinctively a British achievement. Compressed-air and electrically driven coal-cutters were successfully used almost thirty years ago in British mines, and British-built coal-cutting machinery has been exported all over the world, accompanied by trained users from British collieries.

In the thin anthracite seams of Pennsylvania, which are only now being attacked, men with experience gained in British mines are developing the practice.

It is also perhaps not fully realized how greatly the coalfields of the United States are indebted to British-born miners for their present development. Some years ago a collection was made of the life histories of the mine inspectors of the various coal-producing States of the Union, and the preponderance of old-countrymen was so pronounced as to be almost comical.

The members of a party from the recent Chicago meeting of the A. I. M. & M. Engineers were conducted to a coalfield not far from Chicago by a gentleman who appeared to know all about the structure of the coalfield and to have been prominent in its development, but like one of old, his speech betrayed him, and it was evident to at least one observer that the United States was not his birthplace.

The Coal Mines Regulation Act of Great Britain will not allow many of the methods which are practised in coal-mines in the United States, methods which assist materially in the cheap and plentiful production of coal. "Shooting off the solid", the use of black powder, electric-trolley haulages underground, naked lights are all to be found in United States collieries, and while we would not care to state that these practices cheapen coal production in the long run, it is quite certain that the adoption of safer methods would curtail production and increase its cost. Such natural conditions as are found for example in West Virginia, where the coal-seams crop out on the sides of rolling hills, permitting the coal to be easily entered, simplifying all problems of drainage, haulage and ventilation, are a benefaction of Nature, not granted to Britain, where today the coal must be won from deeply situated coal-seams under conditions more onerous than ever were faced by coal-miners in the world before.

Despite the vociferous claims to the contrary, British mining engineers have not been backward in the provision of modern equipment. Much of the most modern and approved practice is of British origin, and will always continue so to be, because the necessity of the British nation for coal will continue to be the mother of invention. It would be difficult to mention one basic invention in colliery practice that is not of British origin, because there coal-mining had its birth, nor has its glory yet entirely departed.

Englishmen and Scotchmen are mining coal, always from comparatively thin seams, because there are no more thick ones, at depths exceeding 3,000 feet. In many cases the colliery workings are miles under the

sea—in one case four miles. We venture to make the following statements in comparing British coal-mines with United States coal-mines, namely, that in the United States no coal is being worked from submarine areas, that no coal is being mined at depths as great as in England, that no coal-seams are being worked as thin as are being successfully mined in England and Scotland, and that coal-cutting machinery is being used in Britain under conditions not yet attempted and not even contemplated in America.

To use terms that a coal-miner will understand, the United States is filling its coal-bin from the "full-heap", while the British are producing from a "fast-end."

THE FUNCTIONS OF THE GEOLOGIST.

The following, clipped from the "Boston News Bureau" is confirmation of the correctness of the views set forth in this column in the 'Journal' of 24th. September.

> "Houghton, Mich.—Calumet & Hecla Min-
> "ing Co. has employed Professor L. C. Gra-
> "ton, geologist, to make a complete geologi-
> "cal survey of the entire territory owned or
> "controlled or managed by its mining inter-
> "ests in northern Michigan, 23,000 acres in all.
> "Geologists Lock, Polache and Burns are here
> "now, doing preliminary work."
>
> "Work was outlined by General Manager
> "MacNaughton and planned two years ago but
> "Graton had to be released for important war
> "work for the government. The job will take
> "two years.
>
> "Permission has been granted the geolog-
> "ists to examine under-ground geological con-
> "ditions at all mining properties in the dis-
> "trict as it is realized that their work will be of
> "general benefit to all."
>
> "The work will not interfere with mining
> "operations at any of the mines. Work was
> "determined from a study of the history of
> "the district and realization that every ore
> "formation in this district was found by acci-
> "dent and without proper geological reckon-
> "ing. Calumet & Hecla bears all expenses."

The management of Calumet & Hecla is to be congratulated on its foresight. We believe, however, as previously remarked, that "the rewards of research are always proportionate to the extent and concentration of effort", and while a two years reconnaissance will doubtless amply reward the Calumet & Hecla people by the results obtained, twenty years of work would yield proportionately greater results, and we do not apologise for again venturing the opinion that the reward which follows the casual employment of a consulting geologist is meagre compared to the advantages that would follow the life-long concentration of a competent geologist upon a selected property.

GROUP INSURANCE OF WORKMEN.

The Calumet & Hecla Company has insured its workmen free of cost to the workmen, and without medical examination. The amount of insurance is from $1,000 to $1,500 depending on length of service. Employees are not eligible for this free insurance until they have worked for six months, then the policy is issued for $1,000. After men have worked for five years, the policy is increased to $1,500. The insurance covers every employee, sex, age and position alike.

This is an excellent innovation, and one that might be followed with great advantage in Canada, but unfortunately, group insurance is illegal under Canadian laws. Just why it should be illegal is difficult to understand. The idea has proved very popular and successful in the United States. The general mortality tables enable the necessary premium to cover the risk to be calculated to a nicety. Underground workers, owing to a popular misconception as to their occupational hazard and general health among insurance companies, find it difficult to obtain satisfactory life insurance policies. The application of general mortality tables makes it possible to effect these group insurances, where the number of persons affected is sufficiently numerous, at much cheaper premiums than would otherwise be possible, and also makes possible the elimination of individual medical examination.

Canadian insurance law should be amended to enable these group insurances to be taken out on this side the line. Group insurance is an almost necessary supplement to a Workmen's Compensation Act. It is of course understood that it is effective only while workmen are in a given employment, and in this way a certain standard of physical fitness is attained.

HAYDEN STONE & CO. OF BOSTON REPORTED LIKELY TO ACQUIRE THE FLIN-FLON MINE, NORTHERN MANITOBA.

It is reported by the Montreal "Gazette" that Hayden Stone & Co. are contemplating immediate purchase of the Flin-Flon Mine in Northern Manitoba.

Associated with the firm will be E. C. Jackling, of New York, well known as the engineer of the Utah Copper Co. Hayden Stone and Co. control the Utah, the Nevada Consolidated, the Ray Consolidated, the Inspiration, and the Chino Copper companies. Only the final details of geological examination remain to be completed before the option is taken up and engineers are now doing this work.

WHERE THE GOLD GOES.

In the course of his speech at the opening of the Lucknow branch of the Tata Industrial Bank, Limited, in India, at the beginning of August, Mr. E. H. Ashworth, I.C.S, said that English enterprise had failed to unearth hidden hoards of wealth which lie unproductive in private hands. As an instance, he cited a case at Lucknow of family property in dispute, one item of which was 1,600 gold bricks, valued at 90,000 rupees, which apparently had laid unproductive in the coffers of the family for upwards of 20 years.

Some Notes on Ores and Rocks of Wasapika Gold Area

By REGINALD E. HORE.

In spite of transportation difficulties progress is being made in the Wasapika area. There would be greater progress if the Government made a serious attempt to build a road to the camp. The road from Westree Station to the Halfway has been greatly improved this summer, but the second half of the road is in very bad condition. The fall rains have made this section of the road practically useless, as owners of teams refuse to risk their horses on it.

At the mines the failure of the road builders is seriously felt. The operators have little doubt that a summer road will be built next year; but they regret that they should be forced to spend so much time and money on transportation when they have so much pioneer work to do on their own properties.

Recently the Ontario Bureau of Mines has sent to the Wasapika area Mr. P. E. Hopkins. Mr. Hopkins is making a geological map of an area including the Wasapika, West Tree, Herrick, Atlas, Bennett, Churchill, Wakanda, Saville, MsIntyre-McDonald, Miller-Adair, Riel-Foicey, Gold Corona and several other properties. He will later go to Shining Tree lake and map an area including the Gosselin property.

The prospectors in the area do not seem to be well supplied with literature on the ore deposits and rocks. The report made some years ago by R. B. Stewart for the Ontario Bureau of Mines and the geological report and maps made by W. A. Collins for the Geological Survey of Canada contain much useful information. It is some time since these reports were issued, however, and it would be well if Mr. Hopkins's report were published promptly. In the meantime the following notes may be of some use.

The Wasapika.—At the Wasapika mine, work has been resumed in the 100-ft. level after some delay necessitated by the timbering of the shaft. The timbering has been completed and when I last visited the property on September 19 another round had been blasted and the new face was largely vein matter. The footwall has not yet been reached, although a thick vein, about 14 ft., and numerous quartz veins, have been cut. I did not see any coarse gold in the quartz in the cross cut, but close examination of some of the quartz just hoisted resulted in the finding of small particles of gold in several pieces of ore.

When I visited the Wasapika mine a month ago the crosscut at the 100-ft. level had been driven about 40 ft. At 31 ft. it had entered a thick vein and the face was still in quartz. The vein material first broken was well mineralized with numerous pyrite crystals and occasional chalcopyrite grains. The white quartz was seamed with sericite of greenish color. Here and there in the white quartz were dark areas of an undetermined mineral. Since returning to Toronto I have examined some of this vein material microscopically. In one piece of the quartz I found a grain of native gold surrounded by a cloudy aggregate of grayish black particles. I have not yet obtained determinable specimens of the dark mineral.

These cloudy aggregates of dark particles attract attention, as they are rather conspicuous in the white quartz. Mr. Rogers gave me one specimen which shows a grain of gold visible to the naked eye. It occurs in a minute streak of the dark mineral. Microscopic examination of this specimen revealed several minute grains of gold surrounded by the dark mineral. I have had some particles of quartz containing the dark mineral tested for tellurium. The quantity of the black mineral suitable for these tests was very small, and the test not conclusive, but no tellurium was found in the material tested. Whether the dark mineral is itself of value or not remains to be determined. Its presence is of some importance in any case, owing to the fact that grains of gold occur with it. In the white quartz the aggregate of dark mineral are much more conspicuous than are the particles of gold.

The rocks encountered in the crosscut are much altered—sericitic, carbonate and pyritic. One specimen of the fine gray schist taken from the shaft showed on microscopic examination an abundance of grains of calcium-iron-magnesium carbonate. Tn this section there are numerous small feldspar crystals, much sericite, a little chlorite and some small pyrite crystals. Another specimen of finer grain and darker color was found to contain a much higher percentage of chlorite. Such rocks are common in the vicinity of gold quartz veins in the Porcupine area.

Microscopic examinations of the quartz from the Wasapika ore deposit show that it has been subject to the great strains. It has very numerous little fractures and many of the grains have been granulated or broken up into a very large number of smaller grains. Those large grains that are not granulated commonly show evidence of strain.

Many of the small fractures in the quartz have been filled with carbonate and six specimens taken from the 100-ft. crosscut all have a very large number of carbonate veinlets. In thin sections that are only one-half inch in diameter there are several such veinlets.

This evidence of great strain in the quartz is not surprising, for the outcrops shows the vein to be much crenulated as though it had been subjected to great pressure applied from north and south. The enclosing rocks have evidently yielded to the strain by flowage. The strong and more brittle vein has been much fractured and has yielded to the compression by pushing away the enclosing rocks. There is now more quartz in 100 fet. along the strike than there was originally. When the pressure was removed the vein, not being elastic, stayed in its crumpled position and the fractures that opened in the quartz were filled with carbonate. Later there has been a period of fracturing of the area under tension instead of compression and one big fracture which crosses the vein diagonally was filled by a diabase dyke.

Two of the sections of ore from the crosscut show gold grains. All the gold grains are in the quartz. They were probably there before the vein was squeezed into its present form. Many of the gold grains are in the granulated quartz areas, but some of them are in rather large quartz grains that show distinct strain shadows and which were probably there when the deformation by pressure took place.

From what I have seen of the ore deposit, I believe the gold deposition to have preceded the folding of the vein. The diabase dykes which cross this and other veins of the area are much younger than the gold deposits. The evidence of great crushing of the vein gives a clue to the nature of the finely granular dark

metallic mineral that shows rather conspicuously in places in the white quartz. This black mineral does not occur in determinable form, but as minute shapeless grains. It is possibly granulated pyrite.

The West Tree.

West Tree gold ore has been carried to all parts of the country and its spectacular character is well known. Where first opened up the deposit was extremely rich. The rich specimens were taken from narrow veins, but the ore is so rich that the samples could not fail to attract attention. However, the absence of a large body of auriferous quartz resulted in the deposit being commonly described by those who examined it as a very small one. Those who saw only a short shoot of very rich ore in a very narrow vein, near the edge of, and striking towards a lake, could not make estimates of tonnage.

My interpretation of the rich shoot is that the surface exposure is but a section across a shoot which may extend downwards for a very considerable distance under the lake. While the sheeted zone with its narrow quartz veins runs about at right angles to the shore line, there is an important sulphide zone in the enclosing rocks that intersects the quartz veins at about right angles. In the old open cut this sulphide zone is seen to be dipping steeply toward the lake. The sulphide zone is broken where the veins occur by a fault which throws the southern part a few paces towards the lake. The rich ore, so far as I can learn, came from intersections and followed the sulphide zone downwards. The old workings are now filled with water, and I have not been able to examine them. I can only venture the opinion that a very considerable quantity of very rich ore will be found if a raise is made in the sheeted zone at its intersection with the sulphide zone. Across the lake a shaft is being sunk in a similar, if not the same, sheeted zone and rich ore is being encountered in the narrow quartz veins. This ore now being developed does not approach in richness the shoot along the intersection with the sulphide zone, but it is good ore. With such ore in the shaft and a good chance of developing more of it as the shaft is deepened and in drifting across the lake in the sheeted zone, and with the probability of encountering very rich ore at the intersection with the sulphide zone, the operators have reason for confidence that the West Tree will prove a profitable venture.

Gold quartz from West Tree shaft.

Gold quartz from the West Tree shaft, while easily distinguished from that of the Wasapika vein, resembles the latter in many ways; it is white quartz, has sericitic seams and numerous small crystalls of pyrite along the seams and occasional irregular grains of chalcopyrite. The gold is more conspicuous than in the Wasapika ore and some very showy specimens are obtained. There is some carbonate with the quartz. The enclosing rocks have abundant sericite, carbonate and pyrite. Seams in the quartz and between the quartz and the rock are chiefly composed of these three minerals. Scattered through the white quartz are conspicuous elongated areas of grayish-black soft mineral that is probably one of the chlorites. Some chlorite occurs also with the sericitite in the seams, The dark chlorite areas in the white quartz are common in West Tree ore but not in the Wasapika ore.

A more important but less conspicuous characteristic of the West Tree quartz is its comparative freeness from marks of deformation by pressure. It does show strain shadows and some granulation, but it has no such fractured character as the quartz from the Wasapika mine.

The gold grains in the West Tree veins are in some instances isolated in clear white quartz. More commonly the gold occurs along seams in the quartz.

One thin section examined with a miscroscope shows a thin seam which separates an area of quartz grains from one of rather coarsely crystalline carbonate. Along this seam are a few large pyrite crystals and a group of irregular grains of chalcopyrite. Scores of grains of gold occur in a distance of one-half inch along and near the seam. Where the seam has any notable width it shows much sericite and a little chlorite. In places it is a tight seam, marked by a string of grains of gold. There are also a number of gold grains between the carbonate crystals near the seam.

Another section of the West Tree ore is chiefly quartz with a few large grains of pyrite. Well within the boundaries of a strained but unbroken grain of the quartz is a grain of gold.

In examining the gold quartz two types of occurrence are commonly found. Isolated grains of gold visible to the naked eye occur in clear white quartz. Fracture faces coated with sericite often shown minute grains of gold. Most of the gold that is easily detected occurs along well defined seams that run. roughly, in the same direction as the vein.

Well rock of quartz veins at West Tree shaft.

The rock enclosing the quartz veins at the West Tree shaft is a distinctly crystalline gray rock that weathers to a brick red color. It is liberally sprinkled with small crystals of pyrite. Pieces of the gray rock which have been exposed to the weather for a few months are mottled with red, owing to a change in color of the contained carbonate.

Traversing the gray rock are well defined white veinlets. These are mostly quartz, but contain some carbonates. When exposed the carbonates soon takes on a red color and is then more prominent. Very commonly the carbonate lies on either side of the quartz with red carbonate borders.

Microscopic examination shows the rock to be largely made up of feldspar crystals and chlorite. In the immediate vicinity of the veins there is a very large quantity of carbonate, but the original crystalline structure of the feldspars is fairly well preserved. There are numerous thin films of sericite in the rock and in some specimens the sericite forms minute seams oriented in one direction, thus giving the rock a somewhat schistose character. All the specimens from near the vein show numerous small crystals of pyrite. The rock was apparently originally a distinctly crystalline part of a thick lava flow, probably an andesite. The original ferromagnesium minerals have disappeared, but there is abundant chlorite and some opaque white areas that resemble the alteration product of titaniferous iron ore. The alteration of the ferromagnesium minerals to chlorite is common in the rocks at some distance from the veins, but the abundant carbonates and pyrite were probably introduced by solutions from the fissures which were subsequently filled with quartz.

Specimens of the rock at some distance from the shaft that are greenish in color and weather to a gray color instead of red are found on microscopic examination to be also composed largely of feldspars and chlorite. They contain some carbonate, but less than do the wall rocks of the veins and apparently the carbonate is of a different composition for it is not on the weathered surfaces.

GOVERNMENT REPORTS ON GEOLOGY OF SHININGTREE AREA.

An excellent report on the general geology of what is called by the Geological Survey "The Onaping Map Area," on the northern border of which is Shiningtree lake area, was published in 1917. It is accompanied by a geological colored map of the area, scale 4 miles to one inch, and a map of Asquith and Churchill townships, sale one mile to one inch. The report was written by W. H. Collins after he had spent several field seasons in the area. The descriptions of the rocks are excellent and prospectors will do well to read pages 33 to 50, for on these pages Mr. Collins is describing rocks that are important ones in the formations that the gold deposits occur in. At the time the area was examined there by Mr. Collins there was little opportunity to examine ore deposits or to map the formations in great detail, but a very good general description is contained in his report and maps.

In the 22nd report of the Ontario Bureau of Mines, 1913, there is on pages 233 to 237 a short report on the West Shiningtree area by Mr. R. B. Stewart. Mr. Stewart visited the area in September 1911 and returned in May 1912. He prepared an excellent sketch map of the area in which gold had been found and briefly described the following mining claims: Gosselin, Caswell, Seville, Jefferson, Bennett, Knox, McDonald-McIntyre, Moore-McDonald, McGuire and Holding.

These two reports should be in the hands of all who do prospecting or development work in the area. Mr. Collins' report can be obtained by application to the Department of Mines, Ottawa, and Mr. Stewart's by application to the Ontario Bureau of Mines, Toronto. There is now being prepared by Mr. Hopkins, of the Geological staff of the Ontario Bureau of Mines, a revised geological map of the Wasapika and Gosselin areas.

RECENT MINING INCORPORATIONS.

Ontario Feldspar, Limited, is incorporated with a capital of $100,000, head office at Toronto, with a comprehensive charter. Incorporators are E. J. Swift, Accountant, R. A. Leaker, Manufacturer's agent, and others.

Hicsha Mines of Porcupine, Limited, is incorporated as a private Ontario Company with capital of $40,000, head office Toronto to do business as miners.

International Anthracite Mines, Limited, is granted Ontario charter to carry on business as miners, wholesalers and retailers of coal, and to do a general cartage business. Head office is Toronto, and capital $200,000. Directors are provisional.

Gabrielle Mines, Limited. Incorporators: Alexander Claude Gray, manager; Ephraim Albert Pelletier, farmer; Charles Arthur Millican, engineer; Louis H. Fournier, inspector; and Frederick Rathnell McLellan, agent—all of Winnipeg. Capital $1,000,000, divided into 1,000,000 shares of $1 each. Chief place of business, Winnipeg.

Bruce Consolidated Gold Mines, Limited. Incorporators: Simon Ripstein, gentleman; Norman Cecil Tobias, broker; Alan Charles Campbell, solicitor; David Crawford, accountant, and Mary Louisa White, stenographer, all of Winnipeg. Capital $2,500,000, divided into 2,500,000 shares of $1 each. Chief place of business, Winnipeg.

The R. A. P. Gold Mining Company of Boston Creek, Limited. Incorporators: Mayne Josephine Kelley, stenographer, and May Lucretia Quillnan, company secretary, both of Niagara Falls; Cecil Alvin Louch, student-at-law; Norman Scarth Macdonnell and Gregory Sanderson Hodgson, barristers-at-law—all of Toronto. Capital $2,000,000, divided into 2,000,000 shares of $1 each. Head office, Toronto.

The Nichols Chemical Company, Northpines, Ontario, advertise that the Northern Pyrites Mines of this Company is resuming operations, and ask for applications for employment.

PERSONALS.

Major Julius M. Cohen returned from France in Command of the 319th Engineers, United States Expeditionary Force. Major Cohen was Chief Engineer of Construction, and Camp Engineer for the past year at Camp Pontanszen, Brest, France.

E. A. Ely has rejoined the staff of Mascot Copper Co., Dos Cabezos, Cochise County, Ariz.and will be engaged in special work for that Company and Central Copper Co. adjoining, for some time. He was for several years a member of the Tousley-Ely Co., mining promoters and operators of Vancouver and prior to 1912 was superintendent of Mascot Copper Co., under President T. N. McAuley.

D. H. McDougall, President of the Nova Scotia Steel Company, and also of the C. I. M. & M. leaves for England on 8th October, accompanied by Mr. W. D. Ross of Toronto and Col. Cantley of New Glasgow. Mr. McDougall expects to visit the more important coal and steel plants in Britain, France and Italy, and to inspect the iron-ore districts in Spain and in Norway and Sweden.

Mr. W. K. McNeill, Provincial Assayer, assisted by Mr. W. R. Rogers, was in charge of the Ontario Mineral Exhibit at the National Exposition of Chemical Industries held in Chicago two weeks ago. A list of the minerals shown will be published in the next number of the "Journal". The exhibit was impressive, and one visitor queried in a tone of obvious surprise: "Are **all** these minerals found in Ontario?" The answer given was more expressive than grammatical, namely: "Yes, and then some." Needless to say neither of the representatives of Ontario could have been guilty of this verbal solecism, but they stood it well.

Mr. J. B. Tyrell delivered a lecture at Winnipeg on October 2nd at the Fort Garry Hotel before the Manitoba Branch of the Canadian Mining Institute on the mineral developments and possibilities of Manitoba. It is understood that Mr. Tyrell was recently in the new mining district North of Le Pas.

In the new Government paper "Future," issued recently in England, Sir Auckland Geddes says: "Coal production is out of gear, because some miners are hunting for fairy gold—something for nothing." As a result, it is properly observed, there is a possibility of employment in all trades being reduced, and the price of food being still further raised.

NOVA SCOTIA NOTES.

Changes in Dominion Coal Colliery Managers.

Mr. Neil A. MacDonald, formerly manager of No. 21 Colliery of the Dominion Coal Company at Birch Grove, is appointed Manager of No. 11 Colliery, in place of Mr. Jas. R. McNeil, who has gone with the Nova Scotia Steel and Coal Company as Manager of the Florence Colliery of that Company.

Mr. John McIntosh, Underground Manager of No. 21 Colliery is appointed Manager. Mr. McIntosh has been U. G. Manager of No. 21 Colliery since it was opened around 1911.

Scotia Producing Large Outputs.

During October the production of the Sydney Mines collieries of the Scotia Company reached 2,600 tons per day, which is the largest single day's output since 1915. Of this tonnage the Florence Colliery contributed 1,020 tons and Princess Colliery 700 tons.

Dominion Coal September Output.

September coal output from the Glace Bay collieries was as follows:

No. 1	20719
No. 2	47657
No. 4	26052
No. 5	5986
No. 6	18284
No. 9	21944
No. 10	9163
No. 11	14146
No. 12	15671
No. 14	14880
No. 15	10328
No. 16	12609
No. 21	11682
No. 22	12519
Total	242,640

This is practically the same production as during August, and compares with 251,000 tons in September 1918. The mines were all idle on the 17th for the local peace celebration. Unusual features in this list of outputs are the small production from No. 2 Colliery and the large output from No. 11 Colliery. An inspection of the figures will show that the percentage of Phalen coal is now less than fifty per cent, and the contribution of the Emery Seam has risen to almost ten per cent. The Birch Grove Collieries, Nos. 21 and 22 maintain a remarkably steady production.

The output for October ought to be much greater, as there is a full number of working days in the month, and October is traditionally a good month for production. Also the demand for cargo and bunker coal at the piers will serve to offset the lessened demand for coking coal, and it may be anticipated also that coking operations will be resumed before long.

Dominion No. 17 Re-Opened.

Producing operations at this colliery were resumed October 2nd. As previously stated in the "Journal" this colliery is the old Victoria Mine, opened originally in 1865 and closed down by the Dominion Coal Company in 1897. Just previous to the outbreak of war the mine had been pumped out, and preparations had been made to provide it with a new permanent equipment, but shortage of labour during the war period enforced the suspension of work here. Construction on a new bankhead is commenced. Sufficient houses for the workers completed before the war, and are ready for occupancy. It is likely the mine will electrically operated, as it is situated close to the main power plant of the Company at Waterford.

BRITISH COLUMBIA COLLIERIES.

From Our Correspondent.

The coal output of British Columbia for the month of August if not definitely known as yet because of the failure of returns to be received from the Crow's Nest Pass Coal & Coke Co. and from the Granby Consolidated Mining & Smelting Co.'s collieries at Cassidys, Vancouver Island. With these exceptions the outputs of the various collieries is as follows:

Vancouver Island.

Name of Company.	Tonnages.
Canadian Western Fuel Co., Nanaimo Collieries.	49,962
Canadian Collieries (D) Ltd., Comox Collieries	35,189
Canadian Collieries (D) Ltd., Extension	18,001
Canadian Collieries, South Wellington	7,473
Pacific Coast Coal Mines, South Wellington	6,510
B.C. Coal Mining Co., East Wellington	3,127
Nanoose Collieries, Nanoose	2,134
Total	122,396

Northern, B.C.

Telkwa Collieries, Telkwa ..... 96 tons.

Nicola Valley.

Name of Company	Tonnages.
Middlesboro Collieries, Ltd.	9,017
Felming Coal & Coke Co.	2,670
Corbin Coal & Coke Co.	1,875
Princeton Collieries	1,965
Total	15,527

Figures are looked for later from the Crow's Nest Pass Field and in the meantime it may be stated that a fairly substantial output is predicted for the month of August because for the first week or more after the men returned to work it was reported that 1,000 tons was producted daily at Coal Creek and 500 tons at Michel. It will be recalled that for some months before this the mines were closed, the men being on strike. As for the Cassidy Collieries it is understood that the production will show a falling off, whether or not as a result of the Privy Council's action in upholding the lis pendens preventing the company from registering its Provincial Crown Grants, is a question over which there is some conjecture.

A feature of the visit of the Prince of Wales to Ladysmith, B.C., was the presentation to His Royal Highness by Mr. Spruston of a small piece of polished coal in a neat oak box 2x2 inches. Accompanying the piece of coal was a card with the following inscription: "Sample Coal Taken from Wellington-Extension. Presented to H.R.H. Prince of Wales at Ladysmith, B.C., Sept. 26, 1919."

Nanaimo.—The underground employes of the Canadian Western Fuel Company in mass meeting Sept. 27th, endorsed an agreement entered into between representatives of the men and the company governing the question of wages and working conditions, to continue in effect from October 1, 1919, to September 30, 1922.

The agreement was signed by the agreement committee representing the men, and G. W. Bowen, managing director, and John Hunt, representing the company. It adds the first bonus of 35c to the basic rate, leaving three bonuses, amounting in all to $1.50 per day worked, in addition to the scale of wages.

The Board of Examination appointed recently for the Province of British Columbia in accordance with the terms of recent amendments to the Coal Mines Regulation Act has announced the results of examinations held at Nanaimo, Cumberland, Fernie and Merritt on August 26th, 27th and 28th. They follow:

First class certificate: Samuel D. Wark, Ladysmith; John McDonald, Merritt.

Second class certificate: John E. Smith, of Coal Creek; George Murray, South Wellington.

Third class certificate: Alfred Davies, Mitchel; James Sneddon, Fernie; John Devlin, Nanaimo.

Mine surveyors: Thos. Wright Scott, Cumberland; Joseph P. Boyce, Nanaimo; Thomas W. Roger, Corbin; Robert McCulloch, Cumberland; W. D. Vallance, Nanaimo; and William Holsworth, Merritt.

The personnel of the Board of Examiners is George Wilkinson, Chief Inspector of Mines, chairman; M. Maird, Fernie, and James Dixon, Nanaimo.

BITUMINOUS COAL FROM ALBERTA BEING USED IN WINNIPEG.

Considerable western Canada coal is being bought in Winnipeg at the present time. This coal is found very useful, especially in the earlier part of the season when the frost is not severe, and some artificial heat is required. At the present time wood is high in price and the dealers say that Alberta coal is cheaper. It burns out to an ash and for this reason is preferable at this time to anthracite, which leaves much debris in the furnace, causing difficuty in relighting.

Eastern coal will be available this year to those who have the price and no shortage is apprehended such as was anticipated a year ago. Producers in western Canada and their able representatives in this city are seeking to encourage the burning of our own product and the railway companies are aiding this patriotic movement.

IMAGINATION.

W. Wallace Alexander, associated with the Elkins estate and a leading light in the Orpheus Club, at a campfire gathering was humorously describing his troubles at a Pennsylvania coal mine which he was seeking to put on a paying basis, according to the Philadelphia Public Ledger. The miners were getting out coal two days a week—the other five days were devoted to christenings. For every christening the whole neighborhood took a day to prepare, a day to celebrate and a day to recover. Finally the problem was solved by hiring a brass band, arranging a parade and having all the christenings take place on the same magnificent, uproarious, welkin-rending day. Who says the business man has no need for the creative imagination?

Owners of the Union Mine, Franklin Camp, near Grand Forks, have signed an option on their property to interests understood to represent the American Mining & Refining Company, the amount involved being about $300,000. The Union is one of the best known mines in the camp, having shipped several thousand tons of ore, much of which carried high value.

COAL AND HEALTH.

By Dr. C. W. Saleeby, F.R.S.E.

Back from the pellucid air of Washington and of New York, where the burning of soft coal is forbidden, to the long-detested dirt of London! We have little enough sunlight, but we use the sunlight of long-past ages, which made our coal, to obscure and defile the exiguous sunlight of to-day; while aided by artificial light, we peer over schemes for the 'sanatorium relief' of tuberculosis, despising and defeating the light of day, which is the incomparable antiseptic against that rapidly-increasing disease. Customarily, as since the beginning of the century, one waits until the first disgusting fog of November suggests that the time has come to make another public attack upon the dirt wherewith the face of London is blackened; but we cannot afford to wait until November now. For this dirt, 'matter in the wrong place,' is part of the capital wealth of our country, infinitely worse than wasted by the feeble-minded inertia with which we misuse it to our destruction. To my year-long appeals as a hygienist it now added the overwhelmingly cogent argument of national economy. Even if the crude combustion of coal did no harm, we could not afford to waste it as we do. But surely a demonstration of some of the ways in which the burning of soft coal injures health may help one's fellow citizens to modify their own domestic practice in the fashion which will help to save their own health and their country's wealth.

We are to learn that, properly considered, coal is not a fuel, but a raw material, infinitely more valuable than gold, from which fuel, among a thousand other precious things, may be extracted. If we burn it as a fuel we provide ourselves with a form of fire which, it is said, English people will never abandon, because it is so delightful to look at and sit by. But no one educate one's self in this respect, as I learned to do as a medical student many years ago, from the day on which strolling round the pathological museum of the University of Edinburgh, I came across four lungs, one the pearly-white lung of a new-born infant, another the pearly-white lung of an Eskimo; the third the dirty gray lung of a city dweller; and the fourth the back lung of a coal miner of that period. Ever since that day, when I sit beside a coal fire, I see, not the lovely glow beneath, but the ugly smoke ascending, and that spoils the picture for me. I counsel you, most aesthetic reader, to look always at the smoke of a coal fire, to consider whither it goes, to imagine it defiling the lungs of the nation's children, who should be 'Non Angli sed angeli,' and in a little while you will look upon a coal fire with disgust instead of delight.

It need only be added that even the wonderful resources of the body, such as the white blood cells or phagocytes, the cilia, or 'eye-lashes,' of the cells that line the air passages, and the filtration mechanism of the nose, fail to protect us against this pollution of the atmosphere. Against natural and ancient dangers our bodies are evolved and armed and armored by age-long adaptation, but it is too much to expect them to be equal to modern atmospheric pollution. The cilia do their best to lash the smoke particles upward, keeping the air passages clear, the phagocytes carry all they can to the glands at the roots of the lung, whence they can never emerge, and if a swab be applied to the back of any metropolitan throat, phagocytes wearily trying to dispose of smoke particles which they have picked up will be readily found. As

for the nose, we blow it and blacken our handkerchief, but even so our lungs get steadily grimier from year to year, and our lives are unquestionably shortened thereby. And all this noxious dirt is part of the nation's wealth, of which we have not nearly enough, which is nowhere being replaced, and for which hosts of men live in the bowels of the earth to extract for our advantage.

Let us try by means of verbal criticism, to throw a ray of enlightenment through the murk of this subject. We use the word fog to indicate alike the sailor's enemy at sea, and the 'London particular,' or 'pea-souper'—which appeals to a depraved sense of humor. We confound as well as choke ourselves. The sea fog is aqueous phenomenon, very serious because it obscures vision, but innocent to health. There is no harm in water as such; are bodies are more than three parts water, and all life, even the bird's or the airman's, is lived in water. The sea fog defiles nothing. We met one on the Olympic in May, off the coast of Newfoundland, and I made a point of examining my nose and mouth and linen and skin, in order to satisfy myself of the immaculate nature of pure fog. Such fog must always be where there is water. We Londoners have the irremovable Thames always with us, and will have fogs accordingly. Smoke the abominable is, in its origin, nature, and results, the very opposite of fog. The combination of the two, which is the shame of our British cities, requires a distinctive, and, if possible, ugly name of its own. The best name for the purpose, I think, is 'smog,' and my present argument is that the time has come to make an end of it. The people who say that we shall always have fogs are merely tiresome and vacuous. Of course, we shall always have fogs (unless, indeed, science learns how to dissipate them, as it surely will, for the convenience of land and marine transport); but the enemy of health is not fog, but 'smog,' made by the shameful waste of the nation's inadequate supply of coal.

The green plant the souree of all our food, thrives in and lives by sunlight. The non-green plant, such as the fungi, which include all the bacteria of disease, such as the tubercle bacillus, cannot exist in the sunlight by which the green plant lives. Sunlight feeds the green plant which feeds us; it kills the non-green plant which kills us. The Finsen light, first introduced at the London Hospital from Copenhagen by the agency of Queen Alexandra, illustrates or typifies (whatever the exact details of its action) this directly antiseptic action of sunlight. We are always looking for the best antiseptic. Direct sunlight is incomparably the best, the cheapest, the oldest, and the most natural antiseptic in the world. The destruction of day-light by our present methods of using coal is the most direct possible contribution to the survival of the tubercle bacillus for our own undoing.

Destroying the daylight we destroy ourselves. All kinds of domestic infection, beginning with tuberculosis, which is the worst, and including such things, named at random, as measles and 'spotted fever' and influenza, are further favored by whatever interferes with ventilation. 'Smog' does that, for the housewife cannot really enjoy opening her windows, not only to the air of heaven above, but to the blackness and grime which pertain to regions infernal. I will not go into the question of domestic cleanliness and domestic service here, since health is my avowed topic; but the argument for cleanliness against the pollution of the air by coal smoke needs no verbal cunning to convince.

The whole of the case against coal smoke, from the standpoint of public health, has by no means been stated above. There is much to fear, for instance, as regards its influence as an irritant in the production of external and superficial cancers. On the other hand, I do not accept at all the recent theories which connect urban smoke in any significant degree with infant mortality.

The remedy, of course, is to do what the national facts and the final arguments of chemists and engineers require, quite apart from any considerations of health. The obvious course is that which, on principle, I have followed for many years past — never buy or consume an ounce of coal, but burn gas, the convenient fuel which coal yields, instead. Any amount of nonsense has been talked about gas, and, as we are now bound by imperious necessity to practice sense in this matter, we may as well learn to talk sense, too. If the whole of the worst alleged in the interests of health against gas fires were true, as it is not, the indictment would be trivial as compared with that which I have indicated against coal smoke pollution of our air and skin and clothes and food and lungs. Of course, a gas fire needs arrangements for the removal of the products of combustion; what fire does not? There is no more difficulty about making such arrangements in the one case than in the other. Will not all the friends of cleanliness and beauty, who hate the tree trunks blackened even as far as our superb Kew Gardens, join with all the friends of hygiene and hasten the reform, which is an immense and urgently imperative piece of national economy? —The Telegraph.

SOUTH AFRICA'S DIAMOND FINDS.

Two valuable and interesting parcels of diamonds have recently been on view in Johannesburg—the one from the Aliwal North fields and the other from the Monteleo property. The first-named exhibit has been on view at the Natal Bank branch of the National Bank, and consists of 425 carats. Among the stones is a yellow octohedron of 30 carats. The Monteleo parcel is of most exquisite quality, and the bulk of it has been valued at not less than £40 per carat. The first parcel received from the Aliwal North fields was sold for £9,500 the other day.

The size and the quality of the stones were both remarkable, the parcel including a large amber-colored stone of 50 carats, while there were quite a number of others of 13 and 14 carats—beautifully clear stones and absolutely without a blemish. The total quantity was 723 carats, and the price works out at £13 a carat. Both parcels are part of a two months' find at Rouxville, on the farm Klipfontein, about eight miles from Aliwal North. Here there are four white riggers working a shaft which is now about 50 ft. deep, and in the last three months they have taken out over £20,000 worth of stones.

The place has been known to be diamond bearing since 1916, but the chief success has been won since July, 1918. From that date a total of 4,313 carats have been sold at a value of £37,259. The total takings of the last two months have been approximately £13,-815, the other portion of the parcel having been sold in Johannesburg for £4,300.

Special Correspondence

BRITISH COLUMBIA.

Geological Survey Activities During Summer in B. C.

Parties representing the Geological Survey Branch, Ottawa, have been at work in various parts of British Columbia this summer. Some of them still are in the field, although the season may now be considered practically at an end. There also was a Yukon Party under W. E. Cockfield engaged in making an examination of the silver-lead lode deposits of the Mayo Country. The results of this expedition will be awaited with considerable interest by mining men.

These parties whose activities were confined to the Province may be enumerated as follows:

Salmon River, head of Portland Canal, in charge of J. J. O'Neill, who was the geologist with the Stefansson Arctic Expedition. This is the zone in which is situated the Premier Mine and a number of prospects of much promise. It is a section which, at present, is being developed on a large scale, diamond drilling being underway on the Big Missouri and one or two other groups of claims. Mr. O'Neill's report, therefore, will be looked forward to with more than usual interest.

Cariboo Country, in charge of B. R. MacKay, who is making a geological survey of the placer gold deposits.

Pacific Great Eastern Ry. Section, between centres of Clinton and Quesnel, in charge of L. Reinecke, who is making a special examination and reports of the soda lakes of that area.

Slocan, in charge of M. F. Bancroft, who is completing a geological survey of the Slocan District started years ago. This work was almost completed by the late O. E. LeRoy, who went overseas and made the supreme sacrifice for country. The late C. W. Drysdale then took up the work but, after getting well on with it, he lost his life by drowning in the Kootenay River. His records also were lost. This occurred in 1917.

West Coast of Vancouver Island, V. Dolmage, who is making a reconnaisance of the coast line.

Brittania Area, Howe Sound, S. J. Scholfield, who is making a detailed examination and preparing a geological map of the Brittania Mineral Zone.

Bridge River Country, S. C. McCann, who also is carrying on work on which the late Mr. Drysdale was engaged at the time of his death. Mr. McCann is preparing a geological map of the section. He now is visiting the Grass Valley Section, California, for the purpose of comparing the geology and the mineralization of the Motherlode District with that on the survey of which he is employed.

Coquihalla River Section, Mr. Charles Camsell, who is in general charge of geological survey work in British Columbia and whose headquarters are at Vancouver B. C. Mr. Camsell was able to get into the field for a few weeks in order to make an examination of this country and his report will be available when the complete account of this year's activities in the Province is issued by the Geological Survey Branch, Ottawa.

THE METAL MINES.

Kimberley, B. C.

The operation of the Sullivan Mines of the Canadian Consolidated Mining & Smelting Co. are seriously hampered as a result of a strike of the metalliferous miners which was declared during the third week in September. Their demand for an increase of $1 per day in wages was not acceded to and it is estimated that opproximately 200 men walked out in proteest. The North Star Mine, owned by Messrs C. C. Thompson and J. L. McKinney, also is affected. The mine was expected to be on a shipping basis again shortly, the work of replacing that part of the plant destroyed by a recent fire having been carried through expeditiously.

Nelson, B. C.

After referring to a marked revival of the mining industry in the Slocan District recently Fred. A. Starkey, Commissioner of the Associated Boards of Trade of South Eastern British Columbia, observes that the Clarence Cunningham properties at Sandon, the Queen Bess, Wonderful and Sovereign, as well as the Idaho-Alamo Mines, are producing on a larger scale than ever before. A brief general review of mining conditions then is given as follows: "The ores from the properties mentioned are treated at the new mill at Alamo, which Mr. Cunningham erected at a cost of $250,000. The Silversmith Mines Ltd. (Slocan Star) is doing remarkably well. On the 8th. and 10th. levels large ore bodies of 120-ounce silver are now under development. At the same time steady shipments of this high grade ore are being made. The Rosebery-Surprise Properties in this section, which include the Surprise, Ivanhoe, Canadian Group, Adam Group, and Bosun, are making record productions. The ores of these properties are treated at the company's mills, which are located at Rosebery and Sandon. The Noble Five, which is owned by Hon. J. Dunsmuir, Victoria, and who recently purchased the Reco Group from J. M. Harris and associates, may be considered to be among the best properties in the Slocan. An immense expenditure has been made on the Noble Five, resulting in the showing up of large bodies of ore at a depth of 3,500 feet. The company has now under construction a mill with a capacity of 200 tons daily to handle the antictpated tonnage from the two groups of claims which comprise the Noble Five and the Reco. Rembler-Cariboo, with additional territory, is meeting with success. Ruth, another old producer, has again come to life with newly discovered ore bodies. The Payne, which has produced millions of dollars worth of ore, has today several lessees working in the lower levels, who are reported to be doing well. M. C. Monaghan and associates are developing ore on the newly-found leads on the Carbonate King and the Silver Reef, which adjoin the Washington Group. George Clark and associates also are at work on the Ocean, which they have under lease. These properties are situated around the Payne Mountain. The McAllister Group, which is under bond, recently produced for its new owners ore running high in silver. A property known as the Grenfell, which has been taken over by George Gormley and associates is reported to be showing up well. New Denver properties under active development and shipping ore are the Molly Hughes, a high-grade silver proposition; the Bosun, producing over 100 tons of ore daily; the California, at Silverton, which is under lease and mak-

ing shipments; and the Standard Silver-Lead Mines, which has a considerable crew of miners engaged on development. The Echo, Galena Farm and Hewitt Mines Ltd. are constantly under development. The Van Roi and Wakefield, owned by Clarence Cunningham, are making for the skippers class. Properties in the dry belt, which includes Slocan Lake and Slocan City District, are the Enterprise, West Mount, Republic, Evening Star, Meteor, and Black Prince. Those which have shipped recently are the Black Prince, Meteor and Enterprise, which carry ores high in silver."

Northport Wn.

The Electric Point Mining Company in the operation of its property, which is situated near Northport and close to the British Columbia boundary line, proposes moving its ore to the railroad entirely by tramways. A year ago the Company built an areal tramway from the Mine to Leadpoint, a distance of more than two miles and a survey of another is being made from Leadpoint to Wood Spur on the railroad. It is seven miles between the two latter points and three miles from Wood Spur to Northport. The first tramway eliminated a sharp descent of the mountain by means of trucks and teams, which meant expensive haulage. If the installation of the second section is decided upon it is figured that costs will be further reduced. The development of a chimney of ore opened up recently is proceeding satisfactorily. The mine now has been developed to a depth of 800 feet and a large quantity of ore is available for shipment. Shipments are being made of ore which accumulated at the bunkers before operations were temporarily suspended some months ago.

Cowichan B. C.

The opening of the Lenora Mine, Vancouver Island, is being proceeded with. G. D. B. Turner, at whose instance chiefly the work is being undertaken, has returned from New York and will remain until development is well started. Alex Meagher will have direct charge, N. A. McLean, who directed preliminary work, having left for Montana to take over the position of superintendent of the Revenue Mine, in which Mr. Turner and associates are interested.

The Manganese ore being shipped from Hill 60, Vancouver Island, to the Bilrowe Alloys Co., Tacoma Wn., is giving satisfaction, the laboratory analysis of the first car being as follows: Manganese, 54.40%, Silicia, 19.5%, Phophorus, .041%. Not less than 100 tons a week are required by the Company and while this amount is not yet being taken out, the mine equipment and camp being installed shortly will permit the handling of such an output with ease.

Vancouver B. C.

The announcement that the annual meeting of the Canadian Mining Institute will be held in Vancouver on November 26, 27, and 28 has been received with gratification by western mining men. This action is accepted as indicating that the importance of the mining industry of the Province of Alberta and British Columbia is becoming recognized throughout Canada. Dr. E. T. Hodge, professor of geology at the British Columbia University, has been appointed general secretary. He occupied a similar position in connection with the recent International Convention at Vancouver, the success of which was in no small measure due to his energy and intelligent direction. Dr. Hodge and the members of the committee of management already are engaged in the preparation of a programme which, it is hoped, will make the first meeting of the C. M. I. held in Vancouver one of the most outstanding in the organization's history.

Brittania B. C.

The attention of the mining men of the northwest has been directed to the Brittania Mining Company's operations recently because of the fact that its large and complete plant is being worked steadily at capacity with rather remarkable results. It may not be generally understood that this Company is equipped with a concentrating plant with a capacity of 2,000 tons of ore a day and has the largest mineral separation plant in Canada. The high grade ore and concentrate is shipped to Tacoma and the tailing is delivered to the beach and carried to sea by the tide. All the machinery is driven by electricity, which is generated by water power. After passing the turbine wheels water is used again in concentrating the ore. At the present time the company controls a length of twelve miles on the Brittania Geological Belt and a width of several hundred feet. During the last few years it has acquired properties from prospectors, for which it has paid out in the neighborhood of $1,500,000. Thus it has been of material assistance to prospectors and small operators who have not the means to proceed with the development of their properties. The mine is in a labyrinth of underground workings between forty and fifty miles in extent, and last year some 24,600 feet of levels, crosscuts, raises and chutes were added, while nearly 27,000 feet of exploration was done by diamond drill.

Ashcroft B. C.

Diamond drilling, which was undertaken by the Provincial Government under the terms of the Mineral Survey & Development Act on the Snowstorm Group of Claims, Highland Valley, has been discontinued temporarily. The exploration is reported to have disclosed some veins of high grade copper and is to be continued after some more surface work is done on the Iona Claims, which are a part of the Snowstorm Group. W. S. Drury D.L.S., of Victoria, has been engaged to survey their properties. In the meantime itis considered likely that the Government will undertake diamond drilling on other properties, application for which has been received from the owners.

Grand Forks B. C.

A route for a proposed power line from the hydro-electric plant of the South Kootenay Power Company to the mine and mill of the Rock Candy Property, Lynch Creek, near Grand Forks, is being surveyed. The installing of additional plant at the Mine is almost complete and shipments running about 100 tons a day are expected to commence about the 1st. of October. Most of the product will go to American chemical plants.

Volney Richmond, superintendent of the Northern Commercial Company, reports that Thomas Aitken will have over 1,000 tons of high-grade ore ready for shipment from his property Nixon Fork, near Ilatarod and a like amount from Katishna near Fairbanks.

Trail B. C.

Ore shipments in gross tons for the week from Sept. 8th to 14th, 1919, inclusive, to the Trail Smelter of the Consolidated Mining & Smelting Company totalled 6,503, bringing the aggregate for the year to 247,651. The largest independent shipper was The Quilp Mine of Washington State with 383 tons while the Mandy, Le Pas, Manitoba, was a close second with 322 tons. Next in order were the Josie (Le Roi) Rossland B. C. and the Blue Bell, Riondell, with 268 and 144 tons respectively. The Sullivan Mine again was the largest contributor of the company's mines with 3040 tons while Centre Star, Rossland B. C., was next with 1855 tons.

Trail B. C.

Since taking over the property of the Dolly Varden Mining Company, Alice Arm B. C. the Taylor Engineering Company has done splendid work. The railway from tidewater to the mine, which was incomplete at the beginning of the season, has been taken to the mine and is in operation and the mine has been re-opened and put on a shipping basis. Approximately 1,000 tons of ore already has been shipped from the Dolly Varden which is reported to be giving returns of over $50 a ton. The development of other properties in the district is going forward energeticcally and it is predicted that there will be a number of paying mines in operation before many months hae passed. Although the attention of the mining world is largely held by the Salmon River Section, Portlanl Canal, at present those interested in Alice Arm hold firmly to the belief that this part of northern British Columbia is destine to command one of the first places among the mineral producting sections of the Canadian West. Operations now are agitating for government assistance to provide wharf and bunker accomodation at tidewater sufficient to take care, not only of the product of the Dolly Varden Mine, but as well of all the other producers and prospective producers of the section.

Salmon Arm B. C.

The report of another important discovery comes from Salmon Arm, Portland Canal, where is located the Premier, the Big Missouri, and other properties much in the public eye of late. The most recent excitement was caused by the presentation of a sample of ore taken from the Spider Group to the Portland Canal Prospector's Association. It was declared to be an exceptional specimen of wire silver and Pat Daly, who was instrumental in interesting B. K. Neill in the Premier Mine and who has been in charge of development at the Ppider, estimates that $10,000 worth of ore was blown down in three shots. Some months ago R. W. Martin, of the Mineral Hill Mine, took the Spider under option for $30,000 and turned it over to R. W. Wood, president of the Premier Mining Co. Mr. Daly has a small force at work on the Spider. Three veins has been found. Two of them are small, one showing two and a half feet of ore, another eighteen inches and a third measuring twenty four across. These showings are being exposed by surface stripping.

Dawson Y. T.

The Mayor Camp in the Upper Stewart River country continues to develop well and it is stated that several thousand tons of ore will be ready for shipment with the opening of navigation next year. Some fifty claims have been staked on Keno Hill, at the head of Lightning Creek, a tributary of Duncan Creek. The Guggenheims are reported to have taken an option on the main group of claims and to have sent in men and supplies in order that work may be continued during the winter. The claims are situated on a high ridge of the Rockies. 1500 feet above the timber line.

Yukon Notes.

The settlement of a several million dollar lawsuit, involving the Granville Mining Company, Canadian Klondike Mining Company, Canadian Klondike Power Company, Marion Steam Shovel Company of Marion, Ohio, and several others, has just been affected at Dawson, Y.T. Among the shareholders are Herbert Hoover, the American food controller, who is a big shareholder in the Granville Company; Chester A. Beatty, a noted New York mining engineer; Lord Braeburn of London; Lieut.-Col. Joseph W. Boyle, of Klondike. It is understood that Lieut.-Col. Boyle retires from the Canadian Klondike Company under settlement.

This large concession was originally secured by Lieut.-Col. Boyle twenty years after which he put on three huge gold dredges, costing half a million dollars each. It is understood that since the settlement a reorganization of the company is planned. The Klondike has from 150 to 200 miles of rich gold dredging grounds yet to be worked, which will require perhaps twenty or more years to work out.

From Dawson comes the report that Matson creek in the Sixty-mile country continues to contribute a share of gold to the Yukon's annual output and promises to do so for some time to come.

J. D. Dyke, John Matson, the discoverer of the creek; and Frank Wagoner, an old timer of the district, all worked on the creek this summer. Some of the time while shoveling in, they got as high as $16 per day. Many days of preparation brought this lower on an average but still left them enough so that they are planning to resume mining next summer and drift the ground the following winter. It will be remembered that several years ago Matson creek and tributaries, which empty into Sixtymile, were stampeded and hundreds of claims staked.

It is reported there is considerable activity also on the Tenmile which flows into the Sixtymile ten miles up from the Yukon. Five men were mining on Sixtymile Creek and more are to be there this winter.

Amos Benson has recently brought to Juneau some fine samples of free-milling gold and heavily mineralized quartz which he secured in the district along Shuck River. One of the samples, a white crystalized rock, carries nuggets of bright yellow gold weighing several grains.

Mr. Benson prospected on the Shuck river some years ago. Though no rich ground was uncovered enough gold was taken from the stream to warrant further investigation.

The ledge from which the samples were taken lies a considerable distance up stream and over a difficult route. Though pleased with his discovery Mr. Benson knows that all good looking prospects do not develop into paying propositions but he believes that this discovery is well worth the expenditure of time and money to demonstrate its worth and, should the ore body prospect as surface indications would show, it would warrant the expenditure of enough money to solve the question of transportation.

NORTHERN ONTARIO.

The Gold Mines.

Boston Creek District.—The clearing of the right of way for the electric power transmission line has been completed this week from the main line to the Miller Independence. The work of putting in the poles is now under way. The electrical equipment is all either on the ground, in course of transportation or ready for shipment, and it will be possible to change over from steam to electric power before the end of the year.

At the present time working forces are growing, some forty men now being on the pay-roll. Two shifts are being worked, and it is proposed to increase forces so as to work three 8-hour shifts. The central shaft has attained a depth of 235 feet and is being continued to the 400-ft. level, where it is proposed to carry on lateral operations along the main ore body.

Added accommodation is being provided for the staff, a new office building being in course of erection.

In spite of the large amount of road work being done in various parts of the mining and farming districts of the north, it is learned from an official source that the Ontario Government has decided to assist the mines in the Boston Creek district by providing satisfactory transportation.

It is learned that the great difficulty to secure men on other roads such as that from Elk Lake to Gowganda, and from Swasthika to Kirkland Lake has made it almost impossible to carry out the proposed work on the Boston Creek road. However, it is authoritatively stated that instructions are being given to have this work carried out.

The marked success which has attended mining operations in this new field long since convinced the Department that a road must be provided for the district as soon as possible, and the statement that the instructions are being issued to carry out the work conveys good news to property owners there.

A party of shareholders of the Boston-Kennedy Gold Mines have just concluded a visit to their property at Boston Creek, returning south Friday night. It is learned that the shaft has reached a depth of 50 feet, and the result of the work so far done has been highly satisfactory, a considerable quantity of commercial ore being encountered.

Included among the party of visitors were the following: T. B. Tough, Dr. H. Logan, Col. W. W. Thompson, A. C. Thorburn, all of Niagara Falls; Col. A. T. Thompson, Ottawa, and Gordon McLaren, Hamilton,, and Phil Grise, Midland.

Arrangements have been made to commence sinking operations on the property of the Catherine Gold Mines, in the township of Catherine in the Boston Creek district. Visible gold and gold tellurides have been previously discovered on surface, and the underground operations are for the purpose of determining the nature of the deposit at depth.

Lake du Parquet (Agotawekami Lake), Quebec.

According to advice from Lake Du Parquet (formerly known as Agotawekami Lake), the Timmins interests of the Hollinger Consolated have secured an option on the Bishop claims, comprising one of the most promising prospects in that district.

The fact that the Timmins interests had entered the district was known. It now develops that they have had a representative in the person of Mr. Pare secure several hundred acres, by staking, and propose to carry out a more or less comprehensive exploration campaign on these claims as well as the Bishop property on which an option is held.

Lake Du Parquet is situated in the Province of Quebec, close to the Ontario-Quebec boundary at a point near Lake Abitibi. Geological conditions are said to resemble in many respects that occurring in the Porcupine field. Quartz veins occur in which there is said to be very considerable mineralization although surface assays do not show a commercial gold content. From some of the outcrops, gold can be "panned" out and a limited amount of visible gold has been found. A small rush of prospectors occurred a year or so ago after which interest died down to low ebb. The entry of the Timmins interests has served to cause added attention to turn in that direction with the result that a number of mining men in the Cobalt district have again become interested in mining claims in that area.

The new district is one about which no sensational statements are being made, and which is contended to be nothing more than a particularly promising prospective area. The fact that the Timmins Brothers have interested themselves is pointed to in the north as reasonable assurance that at least it will receive a fair test.

In view of the promising results met with in the course of exploration work prior to the economic strain caused by the war, a number of properties in the Deloro township section of the Porcupine gold area are expected to resume operations just as soon as adequate labor appears to be available.

On a number of properties in Deloro a considerable quantity of visible gold was found in the early days, and upon which deposits very little other than surface work was done. It is for this reason that mining men anticipate a revival of interest in that area.

Larder Lake District.

The work of continuing the shaft of the Argonaut, Gold, Ltd. (formerly the La Mine D'Or Huronia), in the Larder Lake district, is well under way and will be continued to a depth of 200 feet. Heretofore, work has been confined largely to tunnelling and surface, the deepest point reached being about 70 feet. Diamond drilling has indicated commercial ore at greater depth, and it is proposed to develop these indicated ore bodies.

The company derives electrical power from the power plant of the Associated Goldfields at Larder Lake, being provided with facilities for transmitting about 400 h.p. to the Argonaut. The small test mill will probably be set in operation within the next few weeks, and a moderate rate of production established.

Kirkland Lake District.

The mines of the Kirkland Lake district have exhausted their patience and, knowing that a majority of men in the camp are in favor of returning to work, will immediately set about the work of putting the mines in shape for operation. The situation is peculiar. For instance, while about two-thirds of the men actually involved in the strike have voted in favor of returning to work, the union executive has solicited votes from other parts of the district where the strike is not in force and in that way the result of the voting was changed to a majority in favor of continuing the strike. The situation is so absurd as to lead the mining companies to abide by the will of the men directly involved, and disregard the union executive. As a result of this, those men who have been on strike through

no fault of their own will receive employment which they are urgently in need of.

Toward this end the Lake Shore has already engaged in a number of men and made a start early this week. The Kirkland Lake Gold Mines is expected to follow suit, with similar action at the Wright-Hargreaves. For the time being the general shortage of labor is expected to militate against securing full forces, but today marks the beginning of the end of the strike. The official statement from Ottawa that unemployment during the coming winter will reach at least 80,000 or perhaps amount to as much as 140,000 is interpreted in the north as constituting abundant assurance that the present labor shortage will soon disappear in which event the gold producing mines will be permitted to operate at full blast and during 1920 almost double the record established during last year.

The Hunton-Kirkland Company has let an option on 400,000 treasury shares, and the indications are that an aggressive exploration program will be carried out on the property. Although detailed information is lacking, it is understood the option price is 20 cents a share and will net the treasury something like $80,000.

The Hunton was one of the first properties in the Kirkland Lake district to attract attention due to spectacular gold showings being opened up on surface. It was involved in a deal with English interest at the time war broke out, and it is chiefly for this reason that the active development has been deferred.

The property is situated on the auriferous zone on which is located such properties as the Ontario-Kirkland and the Canadian-Kirkland, and adjoins the producing belt on the immediate south.

Fort Matachewan District.

According to information from the Fort Matachewan district the Nelson group of claims are standing up well under active exploration. Surface work has resulted in showing the veins to be strong and well-defined, and, in one place where a pit was put down a few feet some rich ore has been encountered.

The Nelson claims are situated in the township of Baden, near the Indian Reservation, and just a few miles north from the scene of the first discoveries made in the district.

Porcupine.

An analysis of the physical and financial position of the McIntyre-Porcupine Mine, Ltd., is of particular interest and importance at this time, due to official figures being available for the past fiscal year. Intrinsically, the shares in the company appear to be worth about $1.02 each, based on the following facts:

Ore reserve	433,057 tons.
Value	$11 per ton.
Cost of treating	5 " "
Net profit	6 " "
Total indicated profit	$2,598,342.00
Surplus as of June 30th	1,163,731.83
Combined value profit and surplus	3,762,073.83
Issued shares	3,640,283.00

The earning power of the McIntyre during recent years has been such as to warrant quotations in excess years has been such as to warrant quotations in excess of the intrinsic value. For instance, during the fiscal year ended June 30th, last, a net profit of $527,112.28 was realized after having allowed for depreciation of plant. This is equal to about 14½ per cent on the issued capital of 3,640,283 shares, of the par value of $1 each. However, even this would not appear to warrant current market quotations, the net profits being equal only to 7 per cent on shares purchased at $2 each. Conservative mining men usually consider a 10 per cent return as being a reasonable minimum interest on money placed in shares of precious metal mines, in which case the earning power of the McIntyre as demonstrated in the past year would make the stock worth about $1.40 a share, or some 38 cents a share above the intrinsic value, but 60 cents a share less than present quotations.

Added to the foregoing facts, is another factor. This is the potentialities of the mine. That is to say, although over four and three-quarter million dollars is in present known ore reserves, there is nothing that would indicate that the limit of the ore deposition has been reached. Thus, in paying $2 a share for the stock, the purchaser is betting at the rate of 98 a share above the intrinsic value, or some $3,567,477.34 on the potential value of the mine in addition to the present known value of $3,762,073.83, or a total of $7,329,551.17. In order to realize a net profit of the latter amount, based on costs of $5 a ton and profit of $6 a ton, it would be necessary to mine approximately $13,437,410.47. This compares with just $4,777,324.00 now in sight. Of course, the present surplus is a big consideration and assuming the $1,163,731 surplus has been accumulated on a basis of costs similar to the above calculations, it would be proper to deduct $2,133,508.33 from the $13,457,410.47, thus leaving it necessary to ultimately mine ore containing $11,303,902.14 in order to make the shares of the company worth $2 each. General opinion appears to be that this will indeed be achieved, but the situation is one that shows to what extent the shareholders at large are given to discounting future developments.

Not a few shareholders of the Porcupine Crown have become impatient over the delay in resuming production. Crown operations have been going on during the past severtl months.

The mine has been de-watered, and the mill endeavor, or a constant endeavor to secure sufficient men has met with more or less discouraging results for which reason the operation of the mill has been temporarily delayed. While such large mines as the

The Porcupine Crown Mine

Hollinger and the Dome find it possible to operate at half capacity, it is invariably found to be more difficult to work a small mine at half capacity, hence the delay. In due course, probably this fall it should be possible to resume production. The management is reliable and efficient.

Ore reserves at the beginning of the year were estimated at about $500,000. The financial statement showed a surplus of about $250,000. During the past few months this surplus will probably have been reduced somewhat, but is evidently still above $200,000. It can be seen, therefore, that the physical condition of the mine is comparatively satisfactory as also is the financial position of the company. These factors combine to make Porcupine Crown appear quite sound.

More plentiful labor supply likely to improve gold outputs.

The gold mining industry of Northern Ontario has weathered the storms of adversity of the past three years and is now confronted with conditions which turn the tables. Forty thousand men without employment in Canada, and the number likely to reach eighty thousand this winter or a possible maximum of one hundred and forty thousand before the winter is over. Such is the official statement coming from the Department of Labor at Ottawa.

Unemployment is a condition which is to be regretted. In a great new land like Canada, it is strange that it should exist. Nevertheless, the country is confronted with the cold facts and must prepare to meet them.

In the north, particularly at Porcupine and at Kirkland Lake, the statement is on that seems to bring assurance that the shortage of labor out here at the outposts of Canadian industry and of civilization itself is soon to become dissipated. It seems to convey assurance that within the next few months every gold mine which is equipped with milling machinery will be permitted to operate at full capacity. It even indicates more than that, in this added respect, that it indicates a likelihood of workmen finding it necessary to compete for jobs, with an inevitable increase in the efficiency of the work being done.

It appears to be the consensus of opinion at this time that all that stands in the way of the Hollinger establishing a world record is an adequate supply of labor. It seems to assure the Dome Mines of prosperity commensurate to its position of being the second largest gold mine in Canada; it opens possibilities for the McIntyre-Porcupine being able to increase its output considerably, and it seems to assure the other proven mines of a profitable producing era—such mines as the Lake Shore, the Porcupine Crown, the Kirkland Lake, Teck-Hughes, Tough Oakes, Schumacher, Porcupine V.N.T., Dome Lake, as well as such new mines with mill construction progress under way as the Wright-Hargreaves and the Miller Independence and the Davidson. More than that, it clears the way for the mines now in the development stage, such as the Orr Gold Mines, the Clifton-Porcupine, La Belle Kirkland, the Ontario-Kirkland, Canadian-Kirkland, Elliot-Kirkland, Porcupine-Keora, Baldwin, Matachewan Gold Mines, Argonaut Gold and Bourke's Gold Mines, as well as a number of other promising mining properties situated in Porcupine, Kirkland Lake, Boston Creek, Skead township, Larder Lake, Fort Matachewan and West Shining Tree, from among which number it appears to be reasonable to hope for a number of profitable mining propositions.

The Silver Mines.

At the great majority of mines in Cobalt, operations have once more attained full capacity. No serious shortage of labor has materialized, the price of silver has advanced to new high levels and the general outlook is entirely favorable. The labor strike, now past, has served to clarify the situation in that respect and general prosperity is once more being experienced.

The substantial increases in the price of silver has added a considerable tonnage of ore to reserve at the mines. For illustration, ore containing low silver values, too low to treat at a profit on silver at around $1 an ounce is found to constitute a substantial source of revenue with silver quoted at the present high price. It means that ore which in the old days of 50 cent silver contained 20 ounces to the ton had a value of but $10 a ton whereas ore now containing only 10 ounces to the ton has a value of $11.80 with silver at $1.18 an ounce, at the time of writing.

The McKinley-Darragh has attained a normal rate of output, it is learned, and the last quarter of the current year promises to more than care for the usual dividend rate. The milling equipment is operating at full capacity on ore coming from the main workings as well as from a surface dump and some from the Savage property.

The number of men engaged in somewhat less than in July, not for the reason that tonnage has been reduced, but due to carrying out plans which had been arranged to begin in August.

During the week ended Oct. 3rd, five Cobalt companies shipped a total of ten cars containing approximately 818,223 pounds or ore. This is the heaviest week since the end of the strike almost a month ago.

The Nipissing with four cars was the heaviest individual shipper, as shown in the following summary:

Shipper	Cars.	Pounds.
Nipissing	4	368,751
Buffalo	3	256,170
Trethewey	1	65,177
Hudson Bay	1	64,125
O'Brien	1	64,000
Totals	10	818,223

During the corresponding period the Mining Corporation made a large bullion shipment amounting to 96 bars and containing 95,873.83 fine ounces.

NEW ZEALAND COAL MINERS ALSO DIFFICULT TO SATISFY.

Just at present there is an acute shortage of coal in New Zealand. If the climate of the Dominion made the warming of houses a necessity, the position of the general public would be lamentable. Industry is hampered and we are threatened with restriction of railway and train service. American coal has been brought here via the Panama Canal and landed at a cost of £3 10s per ton. The country would take more even at that price if it were obtainable. Yet New Zealand's coal fields are large and many easily accessible seams are not being worked. Labor is not wholly responsible for this state of affairs, but it is no secret that the local coal miners are "going slow." They have short hours and high pay. With a 44-hour week, a New Zealand coal miner can earn more than a skilled artisan. But the miners are discontented, rightly or wrongly, and their discontent appears to be beyond the power of the industrial laws to remedy.

THE PREMIER GOLD MINE, PORTLAND CANAL, B.C.

Chas. Bunting, one of the original locators in the now famous Salmon River District, Portland Canal, B.C., has written an interesting account of the history of the Premier Mine, of the richness of which much has been heard of late. He also tells something, in general terms, of other mines and prospects of that highly mineralized section.

It is best, however, that Mr. Bunting should speak for himself.

"Much has been written about the Premier Mine, situated near the head of the Portland Canal, which, while interesting, is at variance with the facts. The writer is well acquainted with the property, its ore bodies, values and history and will briefly review the facts relating to the above and indicate the immense possibilities of this remarkable mine. All the known ore bodies of the Premier, three distinct veins generally referred to as the low-grade veins, as well as the high grade vein, are found on two of the company's claims. These are the Cascade Falls No. 4, and the Cascade Falls No. 8, which were two of a group of eight claims numbered 1 to 8 and known as the Cascade Falls group. They are situated on the western slope of the range which divides the Salmon River from the Bear River and were the first locations in that section of the Salmon Valley. They were discovered and staked by Wm. Dilworth and the Bunting Bros. in June, 1910. The two claims numbered 4 and 8, along with an adjoining group staked later by other parties passed to the control of O. B. Bush, the Salmon Bear River Mining Co., being organized by him during the winter of 1910-11 to operate them.

"The work carried on the two following summers by the Salmon-Bear River Mining Co. which consisted of short tunnels and surface cuts, was confined to the low grade showings, the results being fairly good. A great ,outcropping much good looking quartz, some iron pyrites and a little native silver was "passed up" after a few shots had been put into it, and no attempt was made to trace it out. This outcrop has since proved to be the biggest and best surface showing of the high grade vein.

"The property was then idle until the summer of 1914, when it was examined for a well known eastern Canadian company by W. J. Rolf. The outcropping referred to attracted his attention and interest and work commenced at once. The vein was traced for fully 800 feet, down the hill in a westerly direction, the surface was stripped and cuts put in at intervals along its whole length. The results were excellent, good ore being exposed in every cut, some of it running as high as $500 in gold and silver.

"After securing such fine returns, for some unknown reason —possibly on account of the outbreak of the war— this company discontinued work. A good deal of credit is due W. J. Rolf for his shrewdness in confining his work to this particular vein to the exclusion of the low grade showings, thereby demonstrating the presence of at least one large ore body running exceptionally high in gold and silver, with a lead content of less than one tenth of one per cent. Until this time speculation regarding the future of the camp, had been based on the great showing of low grade ore.

"An entirely new conception of the potentialities of the camp was a direct outcome of his activity. The property was then immediately bonded for New York interests by H. R. Plate, and work commenced the ensuing winter. A tunnel, No. 1, was started at an elevation of 2,100 feet on the high grade vein in good ore, and another tunnel, No. 2, at an elevation of 1,850 feet on the middle low grade vein, also in good ore. No. 2 cut the ore shoot diagonally for over 30 feet, the values being good. The tunnel was extended about 200 feet beyond the ore shoot into the country rock, and a crosscut of 30 feet to the left from the face was also in country rock. Work was then stopped in this tunnel. No. 1 tunnel was also driven diagonally across the ore shoot, which gradually left the tunnel on the right hand side at a point about 80 feet in. The tunnel was continued almost straight ahead—following a slip for a considerable distance—for a farther 170 feet a total of 250 feet, without picking up the ore again. A crosscut was also driven to the right for about 12 feet, about half of it being in vein filling, but lean. This tunnel was then abandoned. A crosscut was then driven northerly from a gulch some 200 feet south of tunnel. After being driven 60 feet without getting ore, this too, was abandoned.

" A crosscut tunnel, No. 4, was now started farther down the hill, about 450 feet below No. 2 and driven about 500 feet before the vein was encountered. This proved to have a width of well over 100 feet, but was poorly mineralized. A drift of 40 feet alongside a small diorite dyke was run in which some ore was just showing up when the New York syndicate threw up their bond and quit the camp, after operations extending over nearly 18 months at a cost exceeding $60,000.

"In the summer of 1918, a few months after H. R. Plate had left, R. K. Neill of Spokane was induced by Pat Daly—who had been foreman for both Bush and Plate and still believed it would make a mine—to look over the property. The examination and sampling proving satisfactory, Mr. Neill bonded it the following winter for $100,000, beginning work in the Spring. His first work was done in No. 1 tunnel at the point where the high grade left it to find out what happened to the ore, with the intention of following it if it continued. A few shifts sufficed to show the vein was really paralleling the tunnel, and at no point in the whole 250 feet of Plate's work was it more than 6 feet away, while the face of the tunnel where work was stopped was actually in the vein.

"As the vein here is almost barren—values $1.50—and closely resembles the wall rock in which he had drifted for the last 160 feet, no doubt Mr. Plate failed to realize that he was in the vein. Had he, before deserting this tunnel, driven 2 feet to the right he would have been in $5 ore, while 5 feet ahead would have reached high grade ore.

"This is an outstanding example of a great mine being missed by a very small margin. It is just such hazards and great rewards that gives mining the fascination no other industry possesses.

"When the first work showed beyond a doubt the real direction of the ore body, nothing more was done there. A crosscut was started about 60 feet farther in, and reached the ore in 6 feet. Plate's 12-foot crosscut was extended about 30 feet. After driving each of these crosscuts into good ore for nearly 40 feet, without reaching the other wall, Neill decided to start a crosscut from the face where Plate had quit, and also to drive ahead a further 600 feet to get under the last of the series of open cuts which exposes the ore shoot on the surface and shows it to have a width of from 100 to 150 feet. This crosscut, No. 3, showed good milling ore the first round; at 15 feet high grade came in and stayed the full length of cut. It was driven 82 feet without reaching the hanging-wall, a cut on the surface directly above shows fully 40 feet of good ore yet to be cut. For some distance the full width gave values of several hundred dollars a ton in gold and silver, while the average for the entire 82 feet is better than $55.

"The face of the main tunnel was swung a little to the right and driven ahead. In 4 feet, ore running over $125 a ton showed up on the right hand side; at 10 feet there was a full face of ore, showing considerable natives and ruby silver which gave values of $153 a ton. This tunnel has since been driven about 350 ft. farther and with the exception of about 30 feet, when passing through some almost barren ground the full width of tunnel has been in high grade ore, averaging several hundred dollars a ton.

"No. 4 crosscut which is in about 40 feet cut 10 feet of high grade, then passed into ore of a lower grade. No. 5 crosscut recently started, averages $50 a ton for the 6 feet it is in. This tunnel is now in a distance of approximately 600 feet, giving a vertical depth of nearly 300 feet. It has still to be driven about 200 feet to get under the great surface exposure already described. This will give an additional depth of perhaps 50 feet only as the hill flattens considerably above.

"In the block of ground 800 feet long and fully 100 feet wide as proved by surface cut and underground work and from the surface to the present level, a tonnage of at least 1,000,000 can be safely estimated with a gold and silver content of $30 a ton making a total of $30,000,000. A thorough sampling of all the present workings and openings gives an average value of well over $30 a ton.

"As the ore shoot is bigger, stronger and far richer in the tunnel than on the surface it is safe to assume it will continue for at least 50 feet below the present workings.

"In that event—and any engineer familiar with this ore body would concede that much—a further $10,000,000 can be added to the above total. Work was resumed in No. 2 tunnel this summer, a crosscut being driven to the right, to cut the ore shoot about 150 feet east of the portal where originally cut by Plate. In about 60 feet the ore was broken into. It has a width of 10 feet. The average across is a little less than $20 a ton.

"This crosscut was continued and has since tapped the ore shoot to the south. The face is at present in good ore.

"Each of these veins, and also another to the north of them has the appearance of potential mines. During the whole summer of 1918 the mine was shut down, work being concentrated on the construction of a sleighroad from the beach to the mine, a distance of 16 miles, and a short dock at Hyder for the purpose of shipping ore the next winter. Owing to unforseen delays in the delivery of equipment and an exceptionally early break-up of the snow-road in the spring, only 512 tons was shipped, which gave smelter returns of $168,000.

"Two stopes have been opened up, putting the mine in good shape for shipping as soon as the snow flies. Since the snow went, operations have been almost entirely confined to outside work. A portable sawmill is cutting lumber and a number of new buildings are being erected at the old camp for the accommodation of a greatly increased force of miners. The road is being widened and improved, and new barns and other buildings will be put up at the beach and nine mile. The sawmill has been moved to No. 4 tunnel—H. R. Plates last work—and a new camp is being built there. A compressor is to be installed and the present 5x7 tunnel enlarged to 7x7.

"A crosscut will be started a short distance from the face which will reach the high grade ore shoot in a few hundred feet, at an additional depth of 700 feet below the present workings.

"Providing the ore shoot holds its size and values at that depth—and the chances are decidedly in its favor—the figures relating to the tonnage and values will be almost startling. In that event, this property, which already ranks as one of the world's great mines, would then take rank as one of the greatest.

"It will still be possible to obtain a further depth of fully 500 feet on the vein by driving another tunnel near the foot of the mountain, making a total of not less than 1,500 feet below the highest outcrop. With the downward extension of the ore body to this point it would be conceded the unique distinction of being the world's Premier Mine.

"It remained for R. K. Neill to realize the possibilities dimly disclosed by W. J. Rolf after others had failed, and his great success is in a large measure due to his good mining judgment, and his policy of staying with the ore whenever possible. Such phenominal results after little more than two years' operations have been rarely, if ever, achieved before, even in mining, certainly in no other business.

"The vein in which this ore body occurs is a true fissure. Its strike is No. 80° E., its dip slight and southerly. The vein filling is largely quartz porphyry, often changed completely to quartz. The metallic minerals which can be seen are: argentite, stephenite, native, and ruby silver, and iron pyrites carrying high gold values and there is reason to believe some of the tellurides are present at times.

"Some wonderful specimens of native and brittle silver and some silver glance and ruby are obtained from a small persistent stringer in the big ore-shoot which varies from 1 to 10 inches in width. The values of the whole ore body are fairly well divided between gold and silver, although the latter predominates. The dump at No. 1 has a value well over $200,000, practically every ton having been taken out in straight development. The mine is situated on a rather steep hillside ensuring the most economical mining. There is an abundance of timber for all purposes; also ample water for power, milling, etc., are right at hand. Associated with R. K. Neill of Spokane in this unusually successful venture were R. W. Wood and A. B. Trites of Fernie, B.C., and they are now, with W. R. Wilson of Fernie, the fortunate owners of this ideal mine.

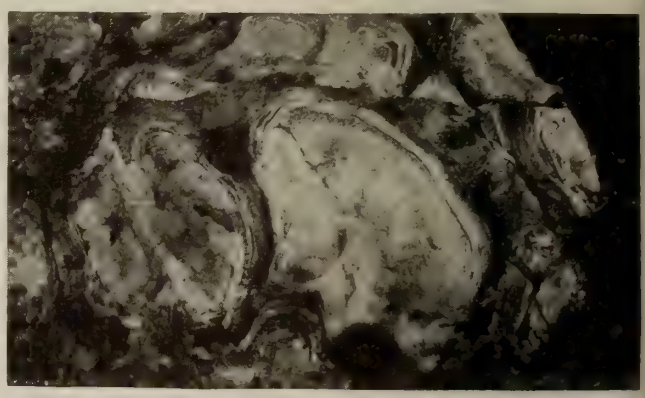
"The successful development of the Premier naturally caused renewed activity and interest, which resulted in the discovery of several new ore bodies of the same character in different parts of the mineral belt. These showings have all the 'ear marks' of mines to a superlative degree so far as the surface is concerned. In some cases the surface exposures are bigger than those of the Premier with the values fully as good."

PILLOW LAVAS.

In the reports of the geologists of the Ontario Bureau of Mines numerous references will be found to 'pillow' lavas. The term is applied to such rocks as are shown in the accompanying photograph of outcrops on the property of the Hollinger Consolidated Mines.

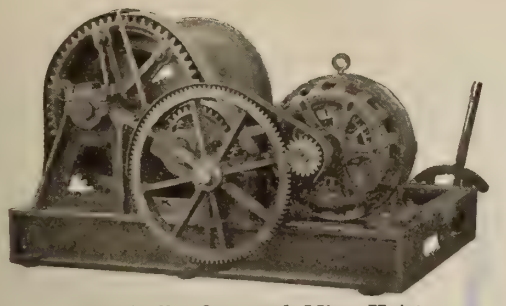
The structural feature illustrated by these photographs is of considerable use in determining the nature of some rock outcrops. There are numerous varieties of fine grained rocks that are not easily identified in the field. The pillow structure is characteristic of certain volcanic rocks and is not found in sedimentaries. It can be used by the prospector as well as the geologist for identification of formations in Ontario gold areas.

Pillow Lava, Hollinger Mine.

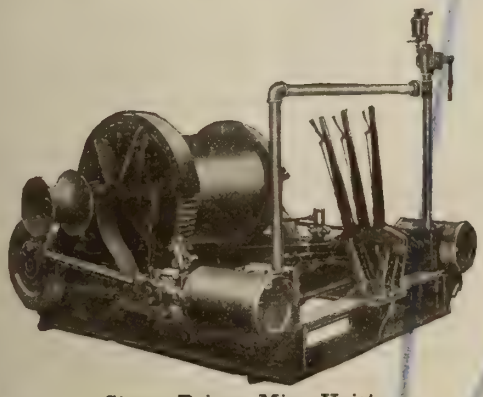


Pillow Lava, Hollinger Mine, a closer view.

Pillow Lava "knobs", Hollinger Mine.



Electrically Operated Mine Hoist.



Steam Driven Mine Hoist.

7 OF OUR MINE HOISTS IN USE BY ONE N.B. MINER 7

and this is not the only firm in Canada using seven of our Hoists.

Would these customers continue to purchase our Hoists from year to year as their business grows without a good reason?

Quality and service count for much more than price in the long run, and while we can assure you that the price of our Hoists is reasonable, the price alone would not have secured us these many repeat orders. These customers were satisfied with the quality of the Hoists, the honest workmanship and material put into the machines, the skill exercised in their design, and their comparative freedom from premature breakdowns or repairs.

Our Mine Hoists are built right, and give the best of service—that is why our customers stay with us, and continue to order more machines as their needs increase.

Choice of 7 sizes in either Electric or Steam Hoists, ranging from 10 H. P. to 50 H. P.

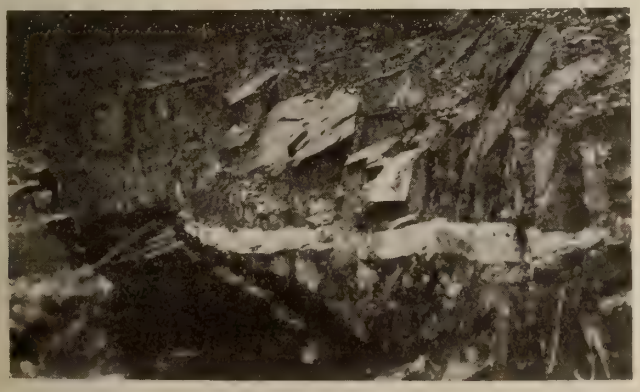
Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

MILLER-INDEPENDENCE GOLD DEPOSITS.

The accompanying photographs show two of the gold deposits on the Miller-Independence property, Boston Creek. Work was at first confined to the nearly flat vein shown in the first photograph. It is a regular well defined white quartz vein enclosed in dark colored basaltic rock. The rich deposit is not well exposed, but the second photograph shows an outcrop at the edge of the rock dump at the shaft. The ore on the dump shows the quartz to be enclosed in a fine grained dark colored rock that has been altered to a light gray colored pyritic rock close to the vein matter.

Outcrop of Quartz Vein Carrying High Values at Miller-Independence Mine. Photograph was taken looking vertically downwards on the ground.



An Auriferous Quartz Vein in Basaltic Rocks. Miller-Independence Mine. Opening is Flooded.

SEVEN HOUR DAY IN SPANISH MINES.

Spanish miners in Asturias have won their fight for the institution of a seven-hour day.

The deputation of miners from the province of Oviedo, which came to Madrid to wait upon Premier Toco and present their demands, was informed by the Premiet that the mine owners had granted the seven-hour day for work in the galleries, and an eight-hour day outside. This applies to Oviedo mines.

The strike movement in Spain in general shows a great decrease, according to a summary of the reports from various parts of Spain, and tranquility prevails throughout the country.

OUR ADVERSE TRADE BALANCE.

Balance of $1,045,000,000 in States' Favor in Three Years.

Winnipeg—Through western Canada fall business was never so promising, or collections and cash discounts so favorable. This is true in all lines, though prices are still advancing. Industrial unrest is appreciably less. Probably the most extraordinary feature of an international character concerns shipment of every variety of lumber to the United States. This heavy draft on the domestic supply has continued all summer, and result has been a marked decrease in building on the prairies since the average consumer refuses to pay the price the American market seems to regard as reasonable for Canadian lumber. This demand of the export trade is attributed to the "build your own home" campaign in the States. Business has increased with the fall orders and one result has been a very much larger cut of logs in Canada than usual, as it is believed demand will continue through next year.

This is the favorable condition under which the Victory Loan will be projected next month by the Federal government. Unfavorable discount in the States is a factor that is seriously agitating the western provinces and curtailing import of American factory products. It is felt American manufacturers should mark the following facts:

In three years ended last June, Canada imported manufactured merchandise from the United States, valued at $2,228,000,000. Her exports on the contrary to the United States, chiefly raw materials, were valued at but $1,183,000,000. Thus unfavorable trade balance was $1,045,000,000 for that period. The United States for these three years supplied 81 per cent of Canada's imports from all sources. Customs returns since June indicate that there is no diminution in these purchases. On the other hand, of Canada's total exports to all countries amounting to $4,029,000,000, only 29 per cent, or $1,183,000,000 went to the States. Fifty-one per cent, or $2,076,000,000 went to the United Kingdom and 20 per cent to all other countries.

Canada's imports for that period from the United Kingdom equalled only $251,000,000, balance in Canada's favor being $1,189,000,000, against unfavorable balance in favor of the United States of $1,045,000,000. Critical state of the foreign trade is the subject of much concern among business men of the Dominion. Canada finds herself already a considerable creditor of Britain and likely to become a heavier one and at the same time ranks as one of the chief debtors of the United States.—Boston News Bureau.

THE LATE JOHN MITCHELL.

A despatch from White Plains, N.Y., which contains the information that John Mitchell, former president of the United Mine Workers of America, left an estate of $250,000 is interesting for many reasons. It seems to constitute still further evidence of the fallacy of socialism.

Mr. Mitchell was a leader of labor. In his short career he accumulated a substantial fortune. There are socialists who declare that no man can honestly earn such an amount. Such a contention finds refutation in every walk of life. The ambitious man is found leading the way, just as Mr. Mitchell was a leader of men. In accumulating $250,000 he performed incalculaby valuable service for labor. In doing so he became a so-called capitalist. There seems to be no doubt but that he worked sincerely for the benefit of the laborers whom he served, for which service he received only a just reward.

When the captains of industry succeed, it is usually through hard work, sometimes almost nerve-racking strain. They exert to the limit all their mental energy and sacrifice pleasure to the extent of working not only during the day but long into the night. By their ability to organize, improve efficiency and avoid waste they not only make it possible for industry to pay greater profits, but make it possible to pay higher wages to the manual worker.

Leaders of men like Mr. Mitchell, captains of industry like Henry Ford and all others who succeed, are a necessity just so long as civilization continues to advance.

There will probably always be competition between the captains of industry and the leaders of labor. It means the life of a nation for such to continue. Without competition, which swings, now to the slight advantage of labor, now to the slight advantage of captains of industry, it would not be possible to find out those best fitted to establish the highest degree of efficiency, lacking which, all humanity would have to pay the price.

Business ability and sane thinking are necessary before any man can truly become a labor leader, or a captain of industry. This is a point that all men should keep in mind. All would then be prepared to have nothing to do with the radicals in all walks of life.—Cobalt "Nugget."

A locomotive burning pulverised coal as an experiment has been in use daily in Pennsylvania for more than a year without losing any time for repairs.

ACADIA COAL COMPANY, STELLARTON, N.S.

Output for September, 1919: Albion, 13,944 tons; McGregor, 6,195 tons; Allan, 4,895 tons; Acadia No. 1 (partly idle), 452 tons; Acadia No. 3, 6,746 tons. Grand total, 32,232 tons.

New Discovery of Coal in New Brunswick.

It is credibly reported that a seam of coal, varying in thickness from sixteen inches to twenty-six inches has been uncovered on the New Maryland Road, leading out from the City of Fredericton towards Fredericton Junction, distant about five miles from Fredericton. The coal is similar in quality to that found near Minto, N. B., as is also the thickness of the seam, its flat character and small overburden. The extent of the field has not been yet proved, but if it should prove that this thin blanket of coal extends from where it has been uncovered near Fredericton to the occurrence of coal with similar characteristics at Minto and the vicinity of Grand Lake, it will be a very important matter for New Brunswick. The seam is thin, but where it occurs near Minto it is of good quality, and the value of coal is always relative to its availability. New Brunswick is now producing about 125,000 tons annually, all from the one thin blanket seam, which is distinguished by its general flatness and light cover.

PROGRESS OF THE CANADIAN MINING INSTITUTE.

The complete manner in which the activities of the Canadian Mining Institute now cover Canada from coast to coast is shown by the last number of the "Bulletin," which contains a list of the Provincial and Local Branches and the Technical Sections now organized.

The Canadian Mining Institute can now claim to be a body that adequately represents all the direct and associated activities of mining in Canada, both in the metropolitan centres and in the mineral-producing districts.

Many years of hard work, much experimentation, much vision and tactful organization, some tribulation, but a far greater sum of good fellowship and a desire to help the other fellow, have combined to bring about the rounding-out of our Canadian Mining Institute, and to secure for it the recognition which it is now accorded as the fully accredited and truly representative concensus of the varied interests that compose the national industry of mining and its outgrowths.

The meeting of the Sudbury Branch reported in this issue, the meeting of the Montreal Branch, the forthcoming meeting in British Columbia, are indications of the wide geographical scope of the Institute, and also of the pervading desire of its members to be up and doing. The goal of the Sudbury Branch to be "the livest Branch in Canada" is finding simultaneous expression in fifteen other branches.

Membership in the Canadian Mining Institute was always a thing to be prized, but to-day it is more than ever a distinction, and C.M.I. members should wear the beaver and crossed hammers as members of the Engineering Institute of Canada, and of the A.I.M. & M.E. wear their society insignia. The members of the C.M.I. belong to no mean society, and they should feel that way about it. Such a feeling is neither "swank" nor egotism, it is but the adequate and sober realisation of a very significant fact. Canada is a continental area only partially prospected. It stands, in potentiality of population and industrial importance, where the United States stood after the Civil War. If the forefathers of the C.M.I. dreamed dreams and saw visions, they set us a good example, because in Canada there lies the substantial stuff from which vision can be translated into actuality, as time and time again it has so been translated in the lifetime of this generation of Canadians.

In the Canadian Mining Institute, now emerged from its adolesence, we have an institution that can guide the mining industry aright, can guard professional ethics while it inspires material progress in the science and art of mining; an institution which has for members the pioneers of mineral dvelopment in the Dominion, and the latest graduates of our mines and universities.

No technical society can look forward to its future with such justified optimism as should guide the policies of the Canadian Mining Institute and inspire the enthusiasm of its membership.

DAMNING WITH FAINT PRAISE.

"There are adventurous spirits who will doubtless rush to The Pas, at the head of Lake Winnipeg, in search of the gold and petroleum reported to have been discovered in amazingly rich quantities in that district. The quest of the golden fleece never wanes, but it will be well to await authentic news on the subject, and it is somewhat suspicious that the alleged find has been made by a travelling Chicago salesman. There may be gold and there may be oil in the neighborhood of The Pas. Both are found in many parts of Canada. New Brunswick produces gold, Quebec also, as well as petroleum, and in Ontario both are found in liberal quantity; to say nothing of silver. Manitoba has more than once before had its rush of gold prospectors. The precious metal is found in the North Saskatchewan river, Alberta has profitable oil fields, and British Columbia is rich in minerals. But not many an El Dorado has yet been uncovered in Canada, though the hope of doing so is constantly nurtured, and the game of chance is irresistible with many people. Surface indications of gold and oil abound and there they stop. Time and money and industry must support faith before the recompense comes, if it ever does come, and while the story of the Pas strikes is interesting, we must wait awhile to learn whether a hoax has been perpetrated, and whether, if otherwise, the indications run below the surface."

The foregoing editorial, under the title of "Time for Incredulity" appeared in a metropolitan newspaper which usually admits to its columns only accurate information, and in its editorial utterances is distinguished by correct historical perspective and wholesome good sense. For once, however, Homer nods, and it would be difficult to find more misinformation, and a more incorrect perspective of the history of mineral development in Canada than is contained in the foregoing quotation.

The Pas is not the scene of the latest mineral discoveries. The district is from 70 to 90 miles north of Le Pas, neither is Le Pas at the head of Lake Winnipeg. We have not heard of the unusual juxtaposition of petroleum and gold assumed to exist in the neighbourhood of Le Pas, neither do we recollect hearing of discoveries of gold in New Brunswick or petroleum in Quebec.

But what is principally to be objected to is the statement that "not many an El Dorado has yet been uncovered in Canada." This is damning Canada with faint praise, and is incorrect. The mineral history of Canada goes back a bare fifty years. The country is not half prospected, and many of the great discoveries have been accidental and fortuitous, and usually associated with railway extensions. Cobalt, Porcupine, the Yukon were none of them mean examples of great concentrations of mineral wealth, nor is there any reason to suppose that these camps will exhaust the "El Dorados"—if one may use the term—of Canada. The Portland Canal, District of British Columbia, the region north of Le Pas (described in the "Journal" of October 1st by Dr. Wallace, the Commissioner of Northern Manitoba) are mineral areas of great promise. In the present issue will be found a description of the Upper Harricana River gold area in Quebec that is of much interest. The possibilities of Northern Ontario are by no means exhausted, as, discounting the vicious promotion literature that is being circulated, there are a number of recent discoveries within an area that has been fairly well mapped and prospected.

What is the meaning of such a statement as "surface indications of gold and oil abound, and there they stop"? Surface indications of gold would satisfy most prospectors, neither are surface indications of petroleum to be despised. If surface indications of gold and petroleum were found combined then the prospector would be justified in becoming excited.

The writer of the editorial referred to writes truly, however, when he says that the hope of uncovering rich mineral deposits in Canada is constantly nurtured. We believe it will continue to be so nurtured. The material results already achieved in Canada justify such nourishment of hope, the geological information available indicates the scientific basis for it, and more than all, the blood of the prospector is the Canadian's rightful heritage. It is not alone the lure of gold that draws men to the search, but as expressed by Chase Osborn, in a book reviewed in this issue, "the greatest charm of prospecting is not the hope of finding wealth, it is life in the clean unhurt out-of-doors."

Incredulity in the reception of much of the mine promotion literature that is being circulated is very timely, but incredulity in regard to the mineral wealth of Canada is not justified by history or by present knowledge.

THE RIGHT TO REMOVE TIMBER FROM MINING CLAIMS IN ONTARIO.

Hartley Dewart has directed an attack against the administration of the Crown Lands Department of Ontario, which has been given wide publicity, which does not measure up to the importance which its wording would imply and which does not find corroboration in this part of Northern Ontario.

Mr. Dewart said:

"Let Hon. Mr. Ferguson throw open the books of his department to me for seven days and I will show the proportions of the dishonest scaling and inspection. Do you understand the conditions under which mining licenses are granted? Go through the North country, and you will find hundreds of claims from which timber has been cut and exported to the United States as pulpwood."

As one who has spent more than a dozen years in prospecting for mineral in the North country, the writer is aware of the unfairness of the foregoing assertions. First of all, it should be pointed out that the above does not charge the Department of Lands, Forests and Mines with dishonesty. It merely implies such by saying "I will show the proportions of the dishonest scaling and inspection." It does not say what proportion, if any, can be shown. The other statement that pulpwood has been whipped from hundreds of claims is probably correct, and mining men as well as prospectors resent the fact of this being incorporated in what purports to be a charge.

The mining laws of Ontario require the holder of a mining claim to perform 240 day's assessment work before a patent can be secured and the timber remover therefrom. Even then certain kinds of timber cannot be removed excepting for building purposes on the property. It costs the holder of a mining claim about $5 a day for performing the assessment duties, or some $1,200 for each 40-acre claim, in addition to which is a patent fee of $3 per acre, making a total of $1,320. In this way it would cost something like $5,280 to acquire 160 acres. When the patent to such land is secured at such large cost, prospectors and mining men in discussing the matter with the writer declare that they fail to see why they should not be entitled to remove timber. Furthermore, the profit which any claim holder can make from timber upon mining claims could not cover the cost of carrying the claims to patent, which fact makes it quite absurd to declare that claims are taken up for that purpose. Prospectors point out that settlers may take up 160 acres merely by paying a fee of $20 and are permitted to remove pulp timber, and fail to see why they should be drawn into a political controversy and thus indirectly made to share the onus of such ridiculous inference which residents in the southern parts of the province may be made to believe true.

J. McRae.

Mr. M. J. Warren, President of the Consolidated Mining & Smelting Company, says Canada can supply ten percent of the world's demand for zinc, and is only producing 25,000 tons. Mr. Warren intimates the Consolidated Company will make arrangements to supply the world demand more commensurate with the ore resources of his Company than the existing reduction facilities.

The Upper Harricana River Gold Area

By ADHEMAR MAILHIOT.
(Professor of Geology at l'Ecole Polytechnique, Montreal.)

In accordance with instructions received from Mr. Theo. C. Denis, Superintendent of Mines of Quebec, the writer spent a part of last summer in making a geological examination in the district adjoining lake DeMontigny (Kienawisik) where recent gold discoveries had been made.

The area is located in Dubuisson and Varsan townships, county of Temiskaming, Province of Quebec. The nearest railway station is Amos on the National Transcontinental Railway, 433 miles west of the city of Quebec and 141 miles east of Cochrane, Ontario. From Amos the route to the district follows the Harricana River on which unobstructed navigation is possible for gasoline launches and small river steamers from the railway crossing to the mining camp and 30 miles beyond. The distance from Amos to lake De Montigny is about 40 miles, and within this distance the river locally expands into three lakes which are known respectively from north to south as lake Figuery (or Peter Brown), lake LaMotte (or Jack Pine), and lake Malartic (or Seal's Home). The stretch of river between lake Malartic and lake De Montigny is locally called the Askigwaj River.

View of Lake De Montigny from Parker's Island.

"A" Shaft, Siscoe Mine.

The country along the water route is of low relief and heavily covered with stratified clay deposited in the bottom of a very extensive lake that, geologically speaking, recently occupied the region of the "Clay Belt" during the recession of the glacial ice-sheet. The valley of the Harricana River is well suited for farm lands and the Quebec Government, for the last five years has been encouraging colonization in that district. The region under consideration is situated just north of the height of land and drains into James Bay through the string of lakes and the Harricana River.

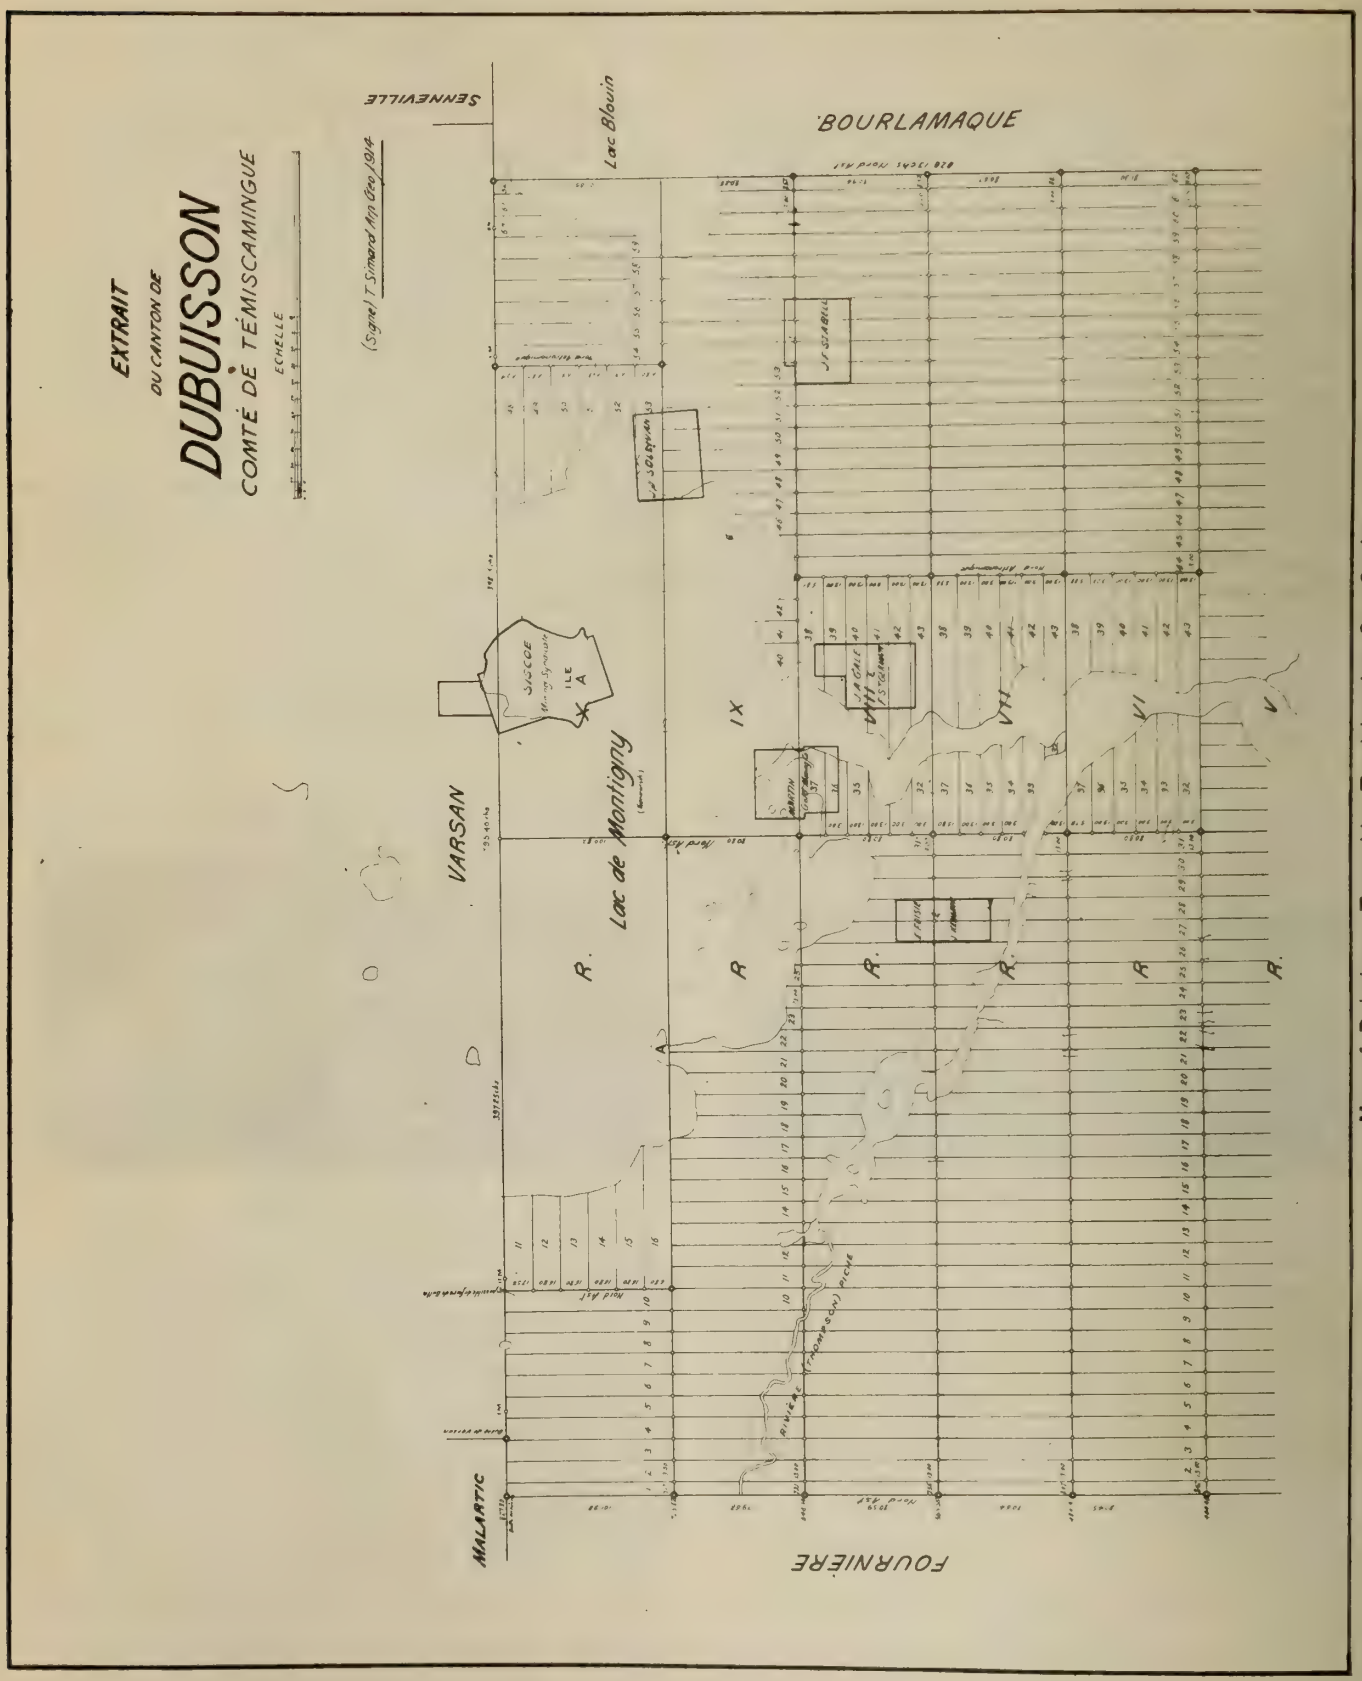
History of Discovery of Gold on Lake DeMontigny.

The first discovery of gold in that district was made in July, 1911, by Mr. J. J. Sullivan; he staked a claim on the eastern shore of lake DeMontigny which was developed as Sullivan's property during the following years. The discovery now owned by the Martin Gold Mining Company, Ltd., was made the same year, with two other gold bearing veins. * In 1915 gold was discovered on the claims now held by the British Minerals Corporation, Ltd., on the largest island in the lake, known as Siscoe Island. Apart from the work done on the latter claims by the Siscoe Mining Syndicate and on the Martin property, there was practically no prospecting done in the district during the war. Since the signature of the armistice numerous prospectors were attracted to the neighborhood of this lake and made some gold discoveries among which the more promising are the following: Stabell, Foisie, Craft, St.-Germain-Gale, Legault, Parker, Caron, Marsil, Clowse and others.

General Geology.

The Lake DeMontigny area is underlain by a series of Keewatin rocks formed mainly of fine-grained green chlorite and hornblende schists. Some of these schists are altered diabase and diorites. Numerous exposures of this green schist can be seen on the southern, eastern, and western shores of the lake as well as in almost all the islands in the lake. Altered basalts showing the pillow or ellipsoidal structure are also common, inter-bedded with the green schist. Good examples of this structure can be seen just west of the Martin shaft, on the Stabell claim, and on the Clowse claim. Cutting these greenstones are a few intrusions of peridotite, granodiorite, and diorite. The former forms part of the two islands just west of Sullivan's property. The granodiorite occupies the whole out-crop of about one-half square mile on Sullivan's property. The diorite forms the country rock of the northern part of the Siscoe Island where the shaft "D" is located. These instrusions probably belong to the Laurentian volcanic activity. Besides these instrusions the country is traversed by numerous dykes of porphyry containing feldspar phenocrysts the size of a pea in a grey or green groundmass. One of these dykes was seen cutting the granodiorite on Sullivan's property and they probably represent subsequent volcanic activity. South of the Thompson River the country is

* See Report on the Geology of the Headwaters of the Harricana River," by Dr. J. A. Bancroft, Report of Mining Operations in P. of Q. for 1912, pp. 217-229.



Map of Dubuisson Township, Temiskaming Co., Quebec.

underlain by the Pontiac schists and in Lacorne township the Laurentian granites and pegmatites are well developed especially at the south-west corner of the township where the pegmatites and the granite contain veins of molybdenite which have been opened up by Mr. Benjamin of Montreal.

Economic Geology.

Sullivan's Claims.

These claims are situated on the eastern shore of the lake and occupy part of lots 48, 49, 50 and 51, range IX, and part of lot 53, range X, Dubuisson township.

"C" Shaft, Siscoe Mine.

It is on these claims that gold was first discovered in July, 1911, by Mr. J. J. Sullivan. The veins are cutting a boss of granodiorite underlying the northern part of the claims. This boss forms a rounded outcrop having about 1,500 feet diameter. The work done upon these claims consists of trenches, test pits and a shaft of 18 feet deep. The veins vary in width from a few inches to 5½ feet. Some ten different veins, or croppings of mineral-bearing rocks, have been found on these claims up to the present time. The strike of the veins varies from due east and west to N. 70° W. Two small outcrops (Nos. 9 and 10) run northwest.

During the summer of 1912 considerable prospecting was done and three new veins roughly paralleling No.

"D" Shaft, Siscoe Mine.

1 vein were discovered and partly stripped. A test pit 10 feet deep was also sunk on No. 1 vein. In March, 1914, work was resumed on the claim and new buildings were erected on the property. Stripping of the surface was continued and new discoveries were made. At the same time test pits and open cuts were made on the different veins, and two shafts, one on No. 4, the other on No. 1 vein were started. These had reached a depth respectively of 9 feet and 18 feet when work was stopped at the outbreak of the war in August, 1914. No other work has since been done on the claims except prospecting and assessment. Most of the work was done on veins Nos. 1, 2, 3 and 4, and it is said that good returns were obtained from the assays. The British Minerals Corporation, Ltd., of Montreal, have taken an option on the property and it is expected that this company will resume work in the near future.

The Martin Gold Mining Co., Ltd.

This company who own parts of lots A and 37, ranges VIII and IX, of Dubuisson township, have a shaft sunk to a depth of 125 feet with over 100 feet of cross-cut and drifts on a gold bearing deposit which has been uncovered at the surface for 700 feet. The vein occurs in the Keewatin greenstones presenting an ellipsoidal structure. An intrusive dyke of feldspar porphyry cuts the Keewatin and roughly parallels the strike of the vein; this intrusive is 50 feet in width where exposed 30 feet west of the vein on the lake shore. The general strike of the vein is S. 45° E. and its dip is about 75° towards the northeast. The vein has been exposed over a distance of 700 feet by stripping and trenching, and its width varies from 2 to 10 feet. It is formed of a bluish banded quartz with inclusions of greenstones. Both the quartz and the adjoining rocks are mineralized, and visible free gold occasionally occurs in the quartz. The shaft has been started on the vein and sunk vertically to a depth of 125 feet. The foot-wall of the vein leaves the shaft

Martin Gold Mining Co., Shafthouse and Mill Buildings.

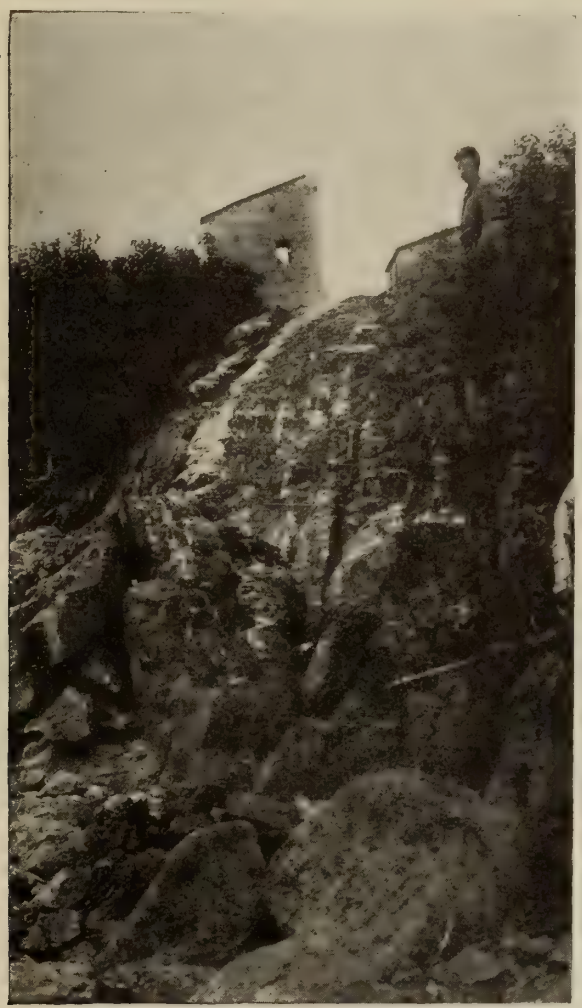
at a depth of about 35 feet. At the bottom of the shaft a cross-cut of 10 feet was driven to catch the vein and a drift was run on the vein 50 feet in a northerly direction and 25 feet in a southerly direction. The width of the vein in the drift is 11 feet. In 1918 the company built a small milling plant, for experimental purposes, near the shaft house. The ore is hoisted in a bucket containing about 600 lbs. and emptied in a small ore-car which is trammed over a trestle to the mill. The ore is passed through a jaw crusher, put into a bin of a capacity of 25 tons, which feeds a 10-stamp battery. The pulp passes over 3 amalgamated plates measuring 4 feet by 6 feet. Milling operations were carried on during part of the summer 1918, but the resulting gold was not disposed of. The ore is said to yield good values. The mine development work was discontinued during July of the present year on account of financial difficulties.

The Siscoe Mine.

This property, which is now operated by the British Minerals Corporation, Ltd., is situated on the largest island on lake DeMontigny occupying an area of 360 acres. The island is underlain by a complex of more or less altered igneous rocks of the Keewatin forma-

tion. The northern part of the island is formed of diorites or andesites and diorite- porphyrites and the rest of the island is formed of greenstones and ellipsoidal basalt. All these rocks are locally cut by irregular dykes which possess the composition of quartz porphyrites.

The gold occurs in quartz veins and stringers, containing much tourmaline, with a little calcite and considerable disseminated pyrite. In one of the veins (the "C" vein) scattered grains and small lumps of scheelite have occasionally been encountered. Four principal veins have been prospected which are known as veins A, B, C and D.



Gold-bearing Vein on the Martins' Property.

On vein "A" a shaft of 45 feet has been sunk on the vein which is practically vertical down to this depth. The vein has been uncovered by stripping for a length of 90 feet.

The shaft at the "B" vein is 32 feet deep, sunk at the contact of a dyke of quartz porphyry, 8 to 10 feet in width, traversing the Keewatin greenstone.

On vein "C" a shaft has been sunk to a depth of 100 feet on a slope of 35° which corresponds to the dip of the vein. The vein at the bottom of the shaft is 22 inches wide. Dr. J. A. Bancroft, who reported on the property this spring for the British Minerals Corporation, Ltd., took four samples across the vein at depths of 41 and 47 feet and had returns of $0.80, $8.00, $21.60 and $33.00 per ton in gold. Dr. Bancroft considers this vein the best that has been discovered on the property.

The "D" vein zone includes a vast number of widely scattered irregular veins and stringers of quartz which rarely exceed a few feet or yards in length. These veins traverse the Keewatin greenstones, possessing the composition of an andesite or fine-grained diorite. In a few places, irregular dykes of light gray quartz porphyry, a few feet in width, traverse the greenstone. Several of these quartz stringers carry "nests" or "pockets" rich in free gold from which spectacular specimens may be taken. This zone was carefully sampled this summer by Mr. John A. Dresser and Professor J. W. Bell of McGill University. In one instance, a bulk sample weighing 8.3 tons was crushed in a stamp mill and amalgamated with the return of $39.64 per ton in gold. This bulk sample consisted for the most part of clean quartz showing an occasional speck of visible gold. In their opinion "the prospective value is sufficient to warrant undertaking further development work, especially taking into consideration the fact that the network of stringers in "D" zone and the "C" vein itself dip towards each other, the possibility of their being related is a matter which merits exploration. This work should be concentrated on the area between C and D and on the D zone. It would be most economically done in the first instance by diamond drilling, say to the amount of three or four thousand feet."

The J. F. Stabell Claim.

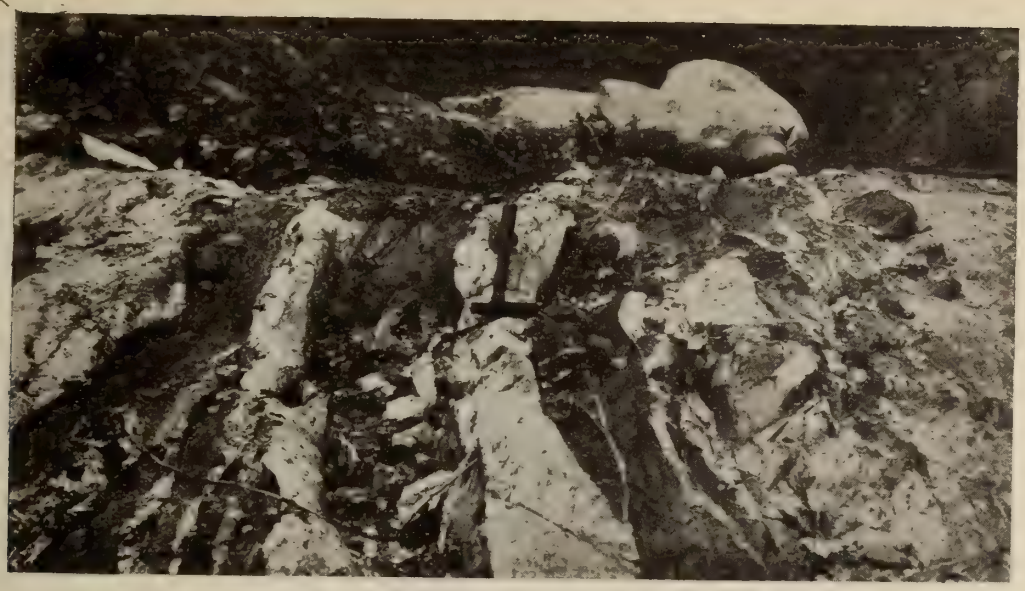
This claim comprises the northern half of lot 53, range VIII, Dubuisson township. A vein varying in width from 2 to 30 feet has been found running across the claim with a strike of N. 40° W., over a distance of about 700 feet. This vein is formed of stringers of quartz interbanded with schist. On the surface the rock is heavily rusted with decomposed iron pyrites forming the gossan. The same vein was found extending towards the west on J. B. Legault's claim. The prospecting work consisted in trenching and stripping on the surface. It is said that one of the prominent operating companies in the Porcupine district has taken an option on this property and will soon start diamond drilling.

The Foisie-Kangrow Claims.

These claims are situated between lake DeMontigny and the Thompson River, lots 27 and 28, ranges VII and VIII, Dubusson township. This claim was staked in early part of June this year and a very promising gold deposit was found by the stakers while making their assessment work. The vein outcrops near the corner post of lots 27 and 28, on range line between ranges VII and VIII. It strikes N. 45° W. and has an average width of about 10 feet. The vein matter is formed of blue and white quartz containing pyrite, chalcopyrite, stibnite, and particles of free gold. It has been uncovered by stripping and trenching for a distance of about 200 feet. There exists in the vicinity of the vein an intrusion of quartz diabase. Mr. Edmond Bregent, mining engineer of Montreal, has taken an option on the property and contemplates to open up that property this fall.

The St.-Germain-Gale Claim.

This claim occupies parts of lots 38, 39, 40, 41, 42 and 43, range VIII, Dubisson township. Three veins have been discovered on it. Vein No. 1 has a width of 35 inches at the bottom of a shaft 18 feet deep. Vein No. 2 has a width of about one foot and a shaft 10 feet deep has been sunk. On vein No. 3 the rock excavation is about 6 feet deep and the vein is only a few inches wide. Spectacular free gold is often found in these veins.



Marsil Vein—Showing interbanded quartz with schist and granite. Total width mineralized zone is over 80 ft.

Stabell Vein and Porphry Dyke.

Gold Bearing Vein on Craft Claim.

Ellipsoidal Basalt on Martins' Property.

The Foisie Kangrow Vein, Stripped.

Other Properties.

There are a few other properties upon which gold bearing veins have been discovered and which are actively prospected by the owners. The most interesting are: J. B. Legault's claim, lots 51 and 52, range VIII, Dubuisson township; this claim is adjacent to Stabell claim, and outcroppings show the continuation of what is thought to be the Stabell vein which has been described above in this article. The Parker claim and the Caron claim occupy a few islands along the southwest shore of the lake. On each of these claims gold-bearing veins have been found. The Marsil claim, situated on lots 39 and 40, range I, Varsan township, the Manibal Claim, lot 35, range VIII, Dubuisson, the Neuveu claim, parts of lots 44 and 45, range VIII, Dubuisson, the Craft claim, part of lots 44 and 45, range VIII, Dubuisson, the Carriere claim, lots 40, 41, 42, range IX, Dubuisson, are the most promising among the others.

EXHIBIT OF THE ONTARIO DEPARTMENT OF MINES.

At the Chicago Exposition of Chemical Industry, Septr. 22nd.

The Ontario Department of Mines is to be congratulated on the comprehensive nature and the excellent selection of the minerals shown at the Exposition of Chemical Industry in Chicago. The exhibit attracted much attention, and from varying grades of visitors, and Ontario's mineral wealth received wide advertisement. A fairly complete list of the exhibits follows:

Sphalerite—Big Duck Lake, north of Schreiber.

Gold ores—Miller-Independence; Tough-Oakes, Kirkland Lake; Hollinger Mine.

Copper Ore—Mine Centre.

Iron ore—Magpie Mine (siderite); Moose Mountain (magnetite, also briquetted ore); Lanark County (hematite).

Pyrite—Canadian Sulphur Ore Co., Queensboro; Nicholls Chemical Co., Goudreau.

Nickel Ore—Mond Nickel Co., Levack Mine; pyrrhotite, Mond Nickel Co., Alexo Mine, Porquis Junction; copper-quartz ore, Mond Nickel Co., Bruce Mine; furnace matte, nickel-copper, Mond Nickel Co.; Bessemer matte nickel-copper, Mond Nickel Co.; nickel and copper sulphates, Mond Nickel Co.

Galena—Jas. Robertson Mine, Galetta.

Molybdenite—Eastern Ontario.

Nickel Ore—Creighton Mine (showing pentlandite crystals); Ingot Nickel, International Nickel Co.

Nickel preparations (sulphate, carbonate, oxides); nickel shot—International Nickel Co.

Silver—Large slab of native silver from Coniagas Mine.

Bar Silver Bullion.

Cobalt bloom.

"Stellite" metal, cobalt-tungsten, chrome alloy, Nickel and cobalt oxides, Arsenic, Metallic cobalt and nickel—Deloro Smelting & Refining Co.

White and metallic arsenic—Coniagas Reduction Co.

Nickel carbonate, metallic cobalt, cobalt acetate, cobalt hydroxide, cobalt sulphate, nickel and cobalt oxides—Metals Chemical Co., Welland.

Ferro-silicon—Electro-Metals Co., Welland.

Cyanimide; nitric acid, urea, ammo-phos (fertilizer), ammonia aqua, ammonia sulphate, ammonia nitrate, dicyandiamid—American Cyanamid Co.

Soda and soda-ash—Brunner-Mond Company.

Gypsum (and number of plaster products)—Ontario Gypsum Co., Caledonia.

Oil shale—Kettle Point, Lambton, C.

Barite—Premier-Langmuir Mine, Connaught Station.

Apatite—Hastings Co., Eastern Ontario.

Yellow ketone oil, acetic acid, wood alcohol, sodium acetate, hardwood creosote, acetate of lime, acetone alcohol, acetone (pure), charcoal, formaldehyde—Standard Chemical Iron & Lumber Co.

Salt (brine, and all grades), caustic soda, bleaching powder—Canadian Salt Co., Windsor.

Marble samples, polished—Bancroft.

Graphite (large block of amorphous graphite, with graded qualities of prepared graphite—Black Donald Graphite Co., Calabogie.

Talc—Geo. H. Gillispie Co., Madoc.

Abrasives (aloxite, artificial carborundum, corundum)—Craigmont, Ont.

Fluorspar—Madoc.

Mica—Lacey Mine, Sydenham. An extremely fine crystal, measuring about 17 by 24 inches.

Feldspar—Richardson Mine, Verona.

Brick Clay—Mattagami River, north of Transcontinental Railway.

BRITISH COLUMBIA CORRESPONDENCE.

Trail B. C.

The Consolidated Mining & Smelting Company is considering plans for the installation of two concentrating plants, one at Rossland B. C. and the other at Kimberley B. C.. The Kimberley installation is said to contemplate a plant having a capacity of 10,000 tons daily at the outset and possibly the erection of another unit of the same size, which would make the total capacity 20,000 tons. If the project thus outlined is carried through the concentrator would be the largest on the continent. The nearest approach to it in this respect is said to be a plant in the State of Utah, which is capable of handling 15,000 tons a day. The several plants of the Anaconda Copper Mining Company, Montana, it is pointed out. take care of 15,000 tons daily. Plans for the Rossland Plant have been under consideration for some months. It was proposed at first to provide a 1500 tons plant but recent reports are that the Company now has in mind a 5,000 ton installation. The chief problem at Rossland has been a source of water.

The City has the first right to a supply but has shown a disposition to share it liberally with the smelting company. The construction of a dam in the mountains near Rossland, it is believed, would take care of this need, although there is no doubt that the expense of the undertaking would be considerable. The proposed site of the Rossland Concentrator is between the War Eagle and the Le Roi Mines and the sources of ore would be the Le Roi, War Eagle and Centre Star Mines, which are the property of the Consolidated Mining & Smelting Co. In these are large reserves of low grade copper-gold ore. At Kimberley the chief ore supply will come from the Sullivan Mines of the Consolidated Company. From these properties from 2,000 to 4,000 tons of lead and zinc ore are shipped weekly, the output for the last eleven days of the month of August being 6,537 tons of zinc and 630 tons of lead. In addition to this ore, which is of smelting grade, the mine contains an enormous quantity of ore carrying zinc and lead in lower percentage. Its removal at a profit was a problem until a year about when it was announced that it had been solved by the metallurgical staff of the Company at the Trail Smeltery.

RUBBER FITTINGS OF BREATHING APPARATUS LEAK IN PRESENCE OF GASOLINE.

James S. Cunningham, Denver. Col., one of the rescuers of the Bureau of Mines, Department of the Interior, and attached to Mine Safety Car No. 2, met death in a storage gasoline tank of the Sinclair Oil and Refining Company, at Trinidad, Col., Monday, August 25. It is thought that while attempting to connect some pipe fittings in the bottom of the tank, his half hour oxygen breathing apparatus touched the gasoline in the bottom of the tank, the rubber in the breathing bag dissolving in the gasoline and allowing the fumes to enter the apparatus.

Commenting on the cause of the fatal accident, and entirely aside from the grief over the loss of a brave rescuer, George S. Rice, chief mining engineer of the bureau, said: "The accident brings out strikingly the serious risk, not previously understood, that is undertaken when a gasoline tank is entered, using the ordinary breathing apparatus in which rubber has been an essential part of the apparatus. As the necessity to enter a partly filled tank to make repairs arises not only on shore but also aboard ship, the Bureau of Mines will make inquiry of the principal refineries and wherever storage tanks are used regarding the frequency with which such conditions are met to establish the importance of the development of a type of apparatus which does not use rubber parts."—"Coal Industry," Pittsburgh.

A New Discovery of Pitchblende

By CYRIL W. KNIGHT.

It having been reported to the Ontario Bureau of Mines that pitchblende, extraordinarily rich in radium, had been discovered in Butt township, east of the Georgian Bay, in the Province of Ontario, the writer was instructed by Thos. W. Gibson, Deputy Minister of Mines for Ontario, to visit the area and make a preliminary examination. Accordingly, two days were spent early in October in this township, and one or two ounces of pitchblende were collected.

The mineral was identified and found to be pitchblende by M. K. McNeill, Provincial Assayer for the Province of Ontario. He also found that it was strongly radio-active.

Butt township is entered by way of Kearney, a town on the Grand Trunk Ry. 167 miles by rail north of Toronto and 6 miles east of Scotia Junction. The deposit of pitchblende is 22 miles north-eastward from Kearney. A wagon road leads to within 4 miles of the occurrence, and the last four miles must be travelled on foot. It may be added that teams, wagons and supplies are obtainable at Kearney for those who desire to visit the area. Hotel accommodation is available at Scotia Junction and Kearney.

The country along the wagon road into the deposit is for the most part rugged, particularly in Butt township. The hills rise two or three hundred feet or more above the valleys, the latter being filled with sand and gravel. In that part of the township in which the pitchblende occurs, the rocks are largely covered with drift, making prospecting difficult. Mica has been mined in a small way in this part of the country, on and off, for years.

The pitchblende occurs sparingly in a coarse, granite pegmatite dike, striking north 25 degrees east, and dipping at about 60 degrees to the northwest. The dike has been worked by an open cut about 40 feet long, and 7 or 8 feet deep. It occurs at the edge of a small lake, locally known as Mica lake, on lots 13 in the sixth and seventh concessions of Butt township. The lake has been partly drained in order to prevent the pit being flooded during mining operations.

The width of the dike is not known, since only the foot-wall has been exposed by the pit, but it appears to be at least three or four feet wide. The length of the dike is also not known, the surface being covered with drift; the open cut shows it to have a length of at least 40 feet.

The dike consists of white feldspar, red feldspar, white quartz, smoky quartz, white mica, black mica, a little tourmaline, pitchblende, and other minerals in small quantity, which have not as yet been identified, but which are being investigated by the Ontario Bureau of Mines.

The pitchblende appears to be associated with the red feldspar, in which respect it resembles the occurrence of euxenite, a radium-bearing mineral, in Lanark county, Ontario, described in the 26th annual Report of the Bureau of Mines, 1917. The euxenite of Lanark county also occurs in a coarse granite pegmatite dike.

Little need be said concerning the general geology of this part of the Province of Ontario. The country rock is pre-Cambrian in age, and consists of banded gneisses, such as granite gneiss, mica gneiss, quartzite gneiss, etc., etc. These banded gneisses cover a great area, extending as they do from the Georgian Bay eastward to the Province of Quebec, and from about Lake Timagami southward almost to Lake Simcoe, a distance of some 150 miles. The gneisses are everywhere cut by numberless dikes of granite pegmatite. It is in one of these dikes that the pitchblende in Butt township and the euxenite in Lanark county occurs. The number of coarse granite pegmatites is so great in the Province of Ontario as to encourage the hope that pitchblende or some other radium-bearing mineral may be found in large quantities.

The pitchblende in Butt township was discovered by Mr. Wm. Elliott who has worked the deposit for mica from time to time during the past three years. About a ton of mica has been mined and shipped. Mr. Elliott noted the presence of a black, heavy mineral which he eventually forwarded to Ledoux & Company of New York City, who gave him the following report, sample No. 1 being the mineral itself, and sample No. 2 the feldspar in which it occurs:—

	Per cent.
No. 1 Uranium	63.60
Equivalent to Uranium Oxide (U_3O_8)	74.98
No. 2 Uranium	0.35
Equivalent to Uranium Oxide (U_3O_8)	0.42

Sample No. 1 appears to be pitchblende; it contains approximately 10 per cent of lead. The radio activity as determined by the electroscope is very high. Calculated at the usual Uranium ratio, the sample contains Radium in the proportion of about 190 milligrams per ton. It is impossible to even approximate the value of such extraordinarily rich ore since there are no established quotations. We think you would be safe in taking $3.00 per pound for the Uranium Oxide contained as a minimum which would give a value of about $4,500.00 per ton of 2,000 pounds.

Sample No. 2 is too low grade to be of any commercial value."

The pitchblende in the township of Butt occurs in grains about the size of peas or larger. Mr. Elliott reports that he has found the mineral occurring in masses as large as an egg.

This is the second occurrence of radium-bearing material in Ontario reported since the Legislature in 1914 offered a reward of $25,000 to the first discoverer of ores or substances containing radium in sufficient quantity for commercial extraction. The reward has been claimed in respect of both discoveries, but so far the conditions have not been met, in that radium has yet not shown to be present in commercial quantity.

Mr. T. J. Brown, General Superindendent of the Nova Scotia Steel Company at Sydney Mines was present at the dedication ceremonies of the Research Laboratories of the United States Bureau of Mines at the end of September. Mr. James MacMahon, First-Aid Director of the Dominion Coal Company, and in charge of that Company's Rescue Station, was also a visitor on this occasion.

ORGANIZATION OF SUDBURY BRANCH OF THE CANADIAN MINING INSTITUTE.

The Sudbury Branch of the C.M.I. was organized on September 4th. The following officers were elected: E. J. Corkhill, Chairman; R. H. Hutchinson, Secretary-Treasurer; E. J. Carlyle, O. Hall and E. A. Collins, Committee.

It is proposed to hold a series of regular meetings of the Branch, with special meetings as often as suitable speakers are available. The meetings will be quite informal and will take the form of a luncheon, followed by a program.

The first meeting occupied the afternoon and evening of October 4th and took the form of a visit to the smelter and other buildings of the British America Nickel Corporation, at Nickelton a banquet at the Nickel Range Hotel, and a very fine lecture on the Rio Tinto mine, Spain, by General Manager W. A. Carlyle of the B. A. N. C., with musical program.

Visit to B.A.N.C. Plant at Nickleton.

The visit to the works at Nickleton was made by members of the Institute and a number of Sudbury citizens interested in mining who had been invited to make the trip. The magnitude of the works, together with their completeness in every detail, came as a revelation to the visitors. The party was conducted through the smelter, power house, shaft house, converter and furnace buildings, dry house, and various buildings, by Manager Carlyle, Capt. Hibbert, and other officers of the company. The trip to Nickleton was made on a special train at 2.30, the visitors returning about six o'clock. Several million dollars have already been expended at Nickleton, and the construction work is rapidly nearing completion. What struck the visitors most was the solid and substantial construction of buildings, the modern mining and smelting machinery, the automatic stokers in the engine room, the layout of the yards and tracks, and the methods employed to ensure the safety of the workmen, together with the provision made for expansion should circumstances warrant after the producing stage has been reached. During the afternoon a visit was paid to the huge dining hall which accommodates several hundred men for dinner daily, and a luncheon of sandwiches, cake and coffee was served to the visitors. The plant installed for preparation of food, it was told these present, was well equipped with everything required to meet the demands of the many workmen.

The Meeting a Success.

That the meeting of the Institute branch was successful beyond all expectations is certain. At the supper in the Nickel Range in the evening President Corkill stated that he had been at many meetings of branches of the Institute in Canada, but never before had he seen so large an attendance at any branch meeting. He was convinced that a mistake had been made in not organizing an Institute branch in this district long ago as a means of bringing mining men together. Ammouncement was made that letters had been received from Hon. Mr. Ferguson, minister of lands, forests and mines, expressing regret at being unable to be present on this occasion, also from the deputy minister, W. T. Gibson. Both men wished the new Institute branch all success, and expressed the hope that they would be able to visit Sudbury on some future occasion. President Corkill invited all members of Institute branches in other places to join the district branch.

Banquet and Lecture.

Returning from the works at Nickleton a banquet was held in the Nickel Range Hotel, followed by a lecture on the Rio Tinto mine in Spain, given by General Manager W. A. Carlyle, of the B.A.N.C., Ottawa. To the banquet in addition to the visiting mining men, were invited a number of local men, including Mr. Chas. McCrea, M.L.A., Major D. M. Brodie, W A. Evans, Mayor Morrison and others. A prominent guest was Mr. J. B. Tyrell, expert geologist for the Dominion government, who was passing through from Winnipeg, coming in on invitation of Institute officials.

Mr. Carlyle's description of the Rio Tinto Mine illustrated by lantern slides was enthusiastically appreciated by a critical audience, and the votes of thanks given to Mr. Carlyle and to Rev. Wm. MacDonald for the loan of the lantern, were well deserved.

Chairman Corkill announced that the Institute intended holding another similar gathering one month hence. It would take the form of a luncheon and a visit would be made to some part of the district.

About 75 persons took part in the excursion and 90 attended the dinner. The Secretary of the Sudbury Branch says the members "are out for the livest Branch in Canada," and the "Journal" wishes them good luck.

THE MONTREAL BRANCH OF THE C.M.I.

A meeting of the Montreal Branch of the Canadian Mining Institute was held at headquarters on the 10th October in the evening, Prof. Bell in the Chair.

Business included election of branch officers, nomination of councillors for the province, and arrangements for the winter's meetings.

Capt. J. G. Ross was elected as Chairman of the Branch and Capt. Kemp as Secretary. A vote of thanks was given to Mr. Graham, the retiring Secretary.

Dr. Adams, the Acting Principal of McGill University, mentioned that the mining classes at the University were larger than for some years past, and not this alone, but the quality of the students was unusually good. He looked forward to a very successful year in the mining classes.

Dr. Bell said he had received a letter from Mr. Eugene Cowles, who is now in South Africa, which, among other matters, mentioned that there was a real dearth of qualified mining men on the Rand, and a number of openings for such men should the supply of positions in Canada be less than the number of applicants.

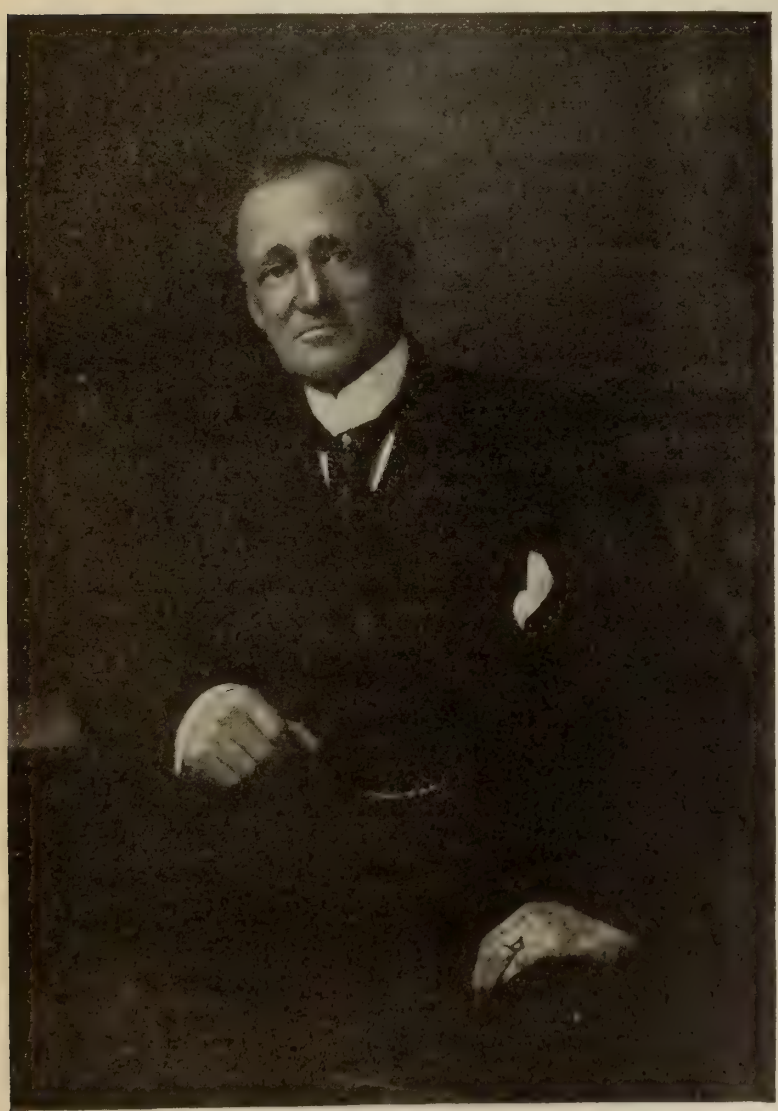
The attendance at the meeting was good, but Capt. Ross, the Chairman elect, was unable to be present, and discussion regarding the winter's programme was deferred. It is suggested the meetings will take the form of a monthly dinner, followed by a meeting.

Mr. C. A. Magrath, late Fuel Controller of Canada, touches the heart of the coal problem in Canada when he describes is as being largely one of transportation, and the purchase and storage of coal in the Summer season. Canada because of climatic conditions has an open and a closed season of transportation, and as the three central provinces of Canada have no coal deposits, they must make transportation fit in with the seasons, or be sorry that they did not.

CANADIAN COAL MEN.

Charles Montserrat Odell.

C. M. Odell was born in Sarnia, Ont. in 1861 In 1864, his father a pioneer engineer of the Grand Trunk Railway, came to Nova Scotia being employed on the Nova Scotia Railway, then being built from Halifax to Pictou. In 1879, C. M. Odell went to Winnipeg, where after two years of hard endeavour and study he joined the staff of the Canadian Pacific Railway, just formed, and went in 1881 to the Rocky Mountains as Assistant-Engineer, on the first survey party sent to the mountain section, running the first line of levels through the Kicking Horse Pass on the route that is now traversed by the Canadian Pacific Railway. In 1885, Mr. Odell came to Cape Breton and was engaged on Government surveys up to the completion of the Intercolonial Railway from the Strait of Canso to Sydney in 1891. In 1893, when the Dominion Coal Company was incorporated, Mr. Odell located the line of the Sydney and Louisburg Railway, and then left the Dominion Company for a short period, being engaged in coal mining and railway location in Inverness County, and in connection with the Coxheath Copper Mine and various local municipal water services.



C. M. ODELL.

In 1897, Mr. Odell returned to the Dominion Coal Company's service as Resident Engineer, and until the affairs of that concern grew so large as to require division into departments he was in charge of all the underground surveys, new construction, and general engineering.

Mr. Odell, therefore, may be justly styled a pioneer Canadian, having seen and assisted in the opening up of the country both in the West and in the East. With the Dominion Coal Company, his record of service is notable even among the permanent officials of a Company that has a good record in this regard, and it may be said that Mr. Odell located the Sydney & Louisburg Railway at the birth of the Dominion Coal Co. and has kept it in good order ever since. This road has probably the most intensive traffic of any single forty miles of track in North America, handling as it has done up to 35,000 tons of coal in one day, and its enviable freedom from accidents is sufficient evidence of the attention that had been paid to the maintenance of track.

As Resident Engineer, Mr. Odell's duties have included the adjustment of land damages, subsidence claims, and kindred matters involving intimate dealing with the local farming population and county and municipal officials, duties in which his encyclopaedic memory, and a justly celebrated gift for incisive characterisation, combined with a clarifying humor that illumines the most dry-as-dust rating appeal, or shortens up legal cross-examinations by dangerous repartee or a solemn reductio ad absurdum, have made his services of great value to the side on which he might be engaged. It may be said that the least of the failings of the inhabitants of Cape Breton is a lack of native shrewdness.

"Charlie" Odell's annual contribution to the proceedings of the Mining Society of Nova Scotia is a feature that always evokes pleasant anticipation, for it is his especial faculty to make wisdom sound like nonesense, and it will never be said of him, as was said of some solemn wise acres of old; "There is that which sayeth naught, and it is accounted unto him for wisdom."

We could tell tales of a wonderful motor craft known as the "See-em-Oh!" and of aquatic feats on the Mira River that would pale the yarns of Rougemont, but are they not written in the annals of the Royal Cape Breton Yacht Club? Nothing that we could tell of Charlie Odells' "feats on the fiord" can exceed the precise truth, and it may be left at that.

That Mr. Odell is a good engineer is not only attested by his record, but will be borne witness to by all who have tried to follow him along a blazed trail in the woods with a dial and a chain, or have tried to outwalk him up some two miles of a seven per cent grade underground.

All good engineers are traditionally inarticulate, at least the "Engineering & Mining Journal" says so, and the subject of our sketch is a good engineer, and he also is the author of an article which appeared in the C. M. I. Bulletin, June number, on "Romance and Rascality in Mine Promoting." There is a terminological inexactitude somewhere.

Letters patent have been issued to incorporate a new mining company in northern Manitoba, to be called the Laura Mines, Limited, with a total capital stock of $2,000,000. The mine is situated in the Rice Lake district.

NOVA SCOTIA NOTES.

Dominion Coal Company Opening a New Mine.

The Dominion Coal Company is opening the Emery Seam near the shore of Big Glace Bay Lake, at the rear of Caledonia Colliery. The area tributary to the new opening will be approximately the area which was tributary to the Caledonia Colliery in the Phalen Seam above, but will be about twice as large in extent because of the extension of the Emery Seam to its outcrop is almost half a mile in the rear of the Phalen Seam lying some 160 feet vertically above. The new mine it is reported will be known as the Victory Mine, No. 24. There are at present two openings on the Emery Seam, namely No. 10 and No. 11 Collieries situated approximately in the same relative position to the Emery Seam No. 5 (Reserve) and No. 3 Colliery on the overlying Phalen Seam.

The growing importance of the Emery Seam was noted in the last issue of the "Journal." It now has attained a production amounting to ten per cent of the output of all the Cape Breton Dominion mines, and its relative contribution is a growing one. Even yet, however, the Emery Seam is virtually a virgin area of coal, superficially much greater in extent than the Phalen Seam lying above, which last-named seam is largely exhausted of solid coal in the land area. Under the Emery again lie the Clarke, Martin and Mullins seams all successively greater in superficial area than the Emery Seam, because of their successive concentric outcrop. All these lower seams are included within the Dominion Coal Company's properties, and they extends seawards below the three seams now being mined in the submarine tract, namely, in successive order, the Hub, Harbour and Phalen seams.

The Emery Seam coal is a good steam coal, with a fairly large percentage of light flocculent ash that does not clinker. The coal is one that is washed with advantage. The sulphur present in the coal is apparently in such form that it can be removed by mechanical washing, and when so treated it makes a good metallurgical coke. The coal is also in good demand for locomotive and steamship bunkers, because the volatile constitutents are relatively low, and do not occasion soot deposition in burning.

In connection with the lower seam of the Glace Bay district, it may be of interest to quote from a chapter on this subject contained in Mr. F. W. Gray's description of the Dominion Coal Company's operations, written in 1907 when the Emery Seam was not being operated. Mr. Gray stated:—

"As the collieries on the Phalen Seam, such as Re-
"serve, Caledonia, and in fact all the older collieries,
"become depleted, the present plant will doubtless be
"used for mining the Emery and Gardiner (or Lor-
"way), and the life of these collieries may be con-
"sidered for the purposes of the present generation,
"as indefinitely prolonged."

"We may expect in Cape Breton as time goes on
"the same appreciation in the value of coalfields as
"has taken place in older countries. In England, for
"example, the thicker seams, such as the Barnsley
"Bed in South Yorkshire and the Thick Coal in Staf-
"fordshire, are being rapidly worked out, and seams
"are now being mined which were at one time entire-
"ly neglected. By the use of coal-cutting machines,
"electric power transmission, longwall face-convey-
"ors and general improvements in mining practice
"afforded by modern equipment, it has been found
"possible to successfully and profitably mine coal-
"seams that do not exceed sixteen inches in thickness.
"When it is considered, therefore, that there are in
"the Glace Bay Basin not less than six seams of coal
"practically untouched which are each over three
"feet in thickness, and that in addition to this the
"Coal Company's submarine leases in the Glace Bay
"Basin, the Lingan-Victoria tract and near Point Aco-
"ni, in the Sydney Mines Basin, are as yet almost
"virgin, it will be seen that there is not yet any need
"for anxiety as to the coal resources."

Minto Mines N. B. Conciliation Board.

A conciliation Board to enquire into the labour difficulties at Minto will sit on the 23rd October with Chief Justice McKeown as Chairman. The men are asking for weekly pay, pit-head scales and recognition of the union.

Toronto Mine of Bras d'Or Coal Company resumes Work.

The Toronto Mine of the Bras d'Or Coal Company near North Sydney has re-opened after a period of idleness caused by lack of orders. Contract for railway coal has been arranged with the Government.

BRUNNER-MOND CANADA, LIMITED.

The mineral exhibit of the Province of Ontario at the Chicago Chemical Exposition included samples of the products of the Brunner-Mond Company, which were from this company's United States plant. The Canadian plant is new, and will not be in operation until this month (October, 1919).

The new plant is expected to produce from 50 to 60 tons of soda-ash daily when operations commence, with an ultimate capacity of 125 tons daily. The company controls and will use a limestone deposit of unusual purity, namely, analysing 97 per cent calcium carbonate. The company holds 525 acres of ground, with four salt wells, and will employ on its works about 200 employees. It will generate its own electric power from turbo-generators, it being extremely important that the processes of manufacture should not be endangered by interruptions in power supply.

The Nichols Chemical Company, Northpines, Ontario, advertise that the Northern Pyrites Mines of this Company is resuming operations, and ask for applications for employment.

Vancouver B. C.

Recent reports by the Mines Branch, Ottawa, on the production of Mica in the Province of Ontario and Quebec and on the muscovite occurrences at Tete Jaune Cache and Big Bend Districts, British Columbia, has directed attention to the fact that the latter are as yet undeveloped and comment is made on the importance, from this point of view alone, of finishing the Pacific Great Eastern Ry. and thus furnishing the transportation facilities necessary for the opening up of these deposits.

SPECIAL CORRESPONDENCE NORTHERN ONTARIO.

Company Stores at Timmins Proving Beneficial.

The mining companies of the Porcupine district are making good their promise to reduce the cost of living. It will be recalled that at a conference of the employes and the employers, each faction recognized the futility of endeavoring to saddle the economic burdens of the day on the other, with the result that it was decided to establish company stores with the object in view of reducing the cost of living. Representatives of the mining companies declared it to be reasonable to expect a reduction of about eighteen per cent.

Several months ago a price list was compiled which is said to show the prices which then ruled. This list has been used as a basis from which to measure the result of the company stores. It now develops that a coupon good for $10 worth of life's necessities at last spring prices, may now be purchased for just $7 or a reduction of thirty per cent.

The system employed by the Hollinger and the McIntyre companies is the establishment of a store the management of which is placed in the hands of a man of proven experience in both wholesale and retail business, and supplies are sold at cost. The plan promises to be successful.

Provided workmen were available the mines of Porcupine could absorb two thousand or more at comparatively short notice. Toward this end it is believed not improbable that the companies and the Soldiers' Civil Re-establishment will be able to cooperate with the desired result in due time.

The Skead District Discoveries.

The gold discovery in the township of Skead is attracting wide interest. The find is perhaps the first one of importance to be made in this district by a returned soldier. The discoverer was Walter Manlay, of Haileybury.

Mr. Manley enlisted with the well-known Borden Battery in January 1915, being one of the sixty men picked from among prospectors of this district.

"Bill" Reilly, partner of Manley's, does not know that he is a partner in the rich gold find in Skead, for the reason that Bill left some weeks ago for the scene of the recent gold find in The Pas in Northern Manitoba and is not expected out to the railroad until the last boat down. Obviously, when he learns that such a prize awaits him, he will lose little time in reaching headquarters at Haileybury.

The Skead find has every appearance of being of at least equal importance as that which caused the rush to The Pas. The spectacular gold showings occur in a dike already found to be upwards of twenty-five feet in width, and compose of altered porphyry and intersected with veins of quartz. The gold occurs in the porphyry. So far, owing to the overburden being heavy, the full width of the dike has not been determined, although trenching to a depth of as much as sixteen feet has been carried on. The group of six claims, known as the Manley-Reilly Group, and in which Harry Crawford, of Haileybury is also interested having been given an interest for recommending the Skead area to Manley, is situated in lot 6 in the 6th concession of Skead. The claims had been previously staked, but their holder failed to do the necessary surface work to discover the gold which literally lay right at the very grass roots. The valuable ground was accordingly permitted to revert to the Crown, later to be re-staked by Manley, on behalf of himself and Reilly, the present owners.

Work on the Wisconsin-Skead is being carried on aggressively, drifting operations being carried in two directions at the 100-ft. level. Results obtaining are said to be favorable.

At the Crawford-Skead some surface work is being done, and arrangements are being made to do some sinking.

In addition to the spectacular gold find on the Manley-Reilly Group, promising gold finds have been made on other claims, including the Gorman-Meaney claims, as well as claims owned by Harry Martin of Montreal.

Lake Shore Mine.

Harry Oakes, president of the Lake Shore Mine, states that milling operations are to be resumed at the Lake Shore within the next few days. Some little time will be required to de-water the mine, but sufficient ore is on surface to keep the mill running for perhaps six weeks more, while, at the 100-ft. level of the mine sufficient ore is available on which to operate for at least several months and possibly a good deal longer. The mine is in such a condition that a force of less than thirty men is all that are required to produce at full capacity.

The dividend of 2½ per cent declared payable October 25th to shareholders of record October 15th will call for the disbursement of $50,000 and shows the extent of the confidence of the director in being able to get the mine back to a normal basis of production without difficulty.

Kirkland Lake District.—Statement by Manager of the Teck-Hughes Gold Mines.

Regarding the position of the mines in the Kirkland Lake district, a summary of the situation has been received from Mr. D. L. H. Forbes, manager of the Teck-Hughes Gold Mines, Limited, as follows:

"It will be recalled that the mines of this district (Kirkland Lake) were closed down on June 12th by a general strike which was precipitated on two days notice and in violation of the rules of the miners' union.

"With very few exceptions, the men employed at the Teck-Hughes and other mines here expressed themselves as being satisfied with the working conditions and not in favor of the strike. Nevertheless, these men quit work in sympathy with the rest rather than be branded with the ugly names used by the strikers. Almost immediately following the strike about nine-tenths of our former employees left the district to seek work elsewhere, while the few who were left here obtained work in various odd jobs such as road building, assessment work, and prospecting. In the face of this condition, we had no alternative but to minimize the loss from maintaining an idle mine and plant and to await patiently the turn of the tide.

"About the middle of September a movement among the business men and workers with families living in the district was started with a view to re-opening negotiations with the mines in order to have then start up again. As a result of this movement a conference between the mine managers and a Committee of the workmen took place at which the mine managers presented the workmen's committee with their wage schedule and a proposal for representation of the workmen in deciding the working conditions of the camp by means of electing committees from each of the operating mines. The stand taken by the mining companies in this matter was a determined one to the end that any

alterations and ajustments of the wage-scale or working hours must come as a result of conference and cooperation by the workmen actually in their employ and not as a result of a strike precipitated by socialist agitators most of whom were merely parasites on the real workmen of the district.

"The conference appeared at the time to appeal to the reason of the better elements of the handful of workmen left here but, when a vote by secret ballot was subsequently taken on the question of calling off the strike, the votes of the well known majority of the workmen were in some farcial manner, perhaps by the simple expedient of stuffing the ballot box, overruled by the socialist minority. At about the same time, the latter commenced an insidious propaganda to intimidate the workmen who wanted to return to work and to frighten away any man who might want to come in from outside to work.

"As the majority of the workmen left in the district were thus made unable to declare the strike called off, this and some of the other mines have taken it upon themselves to make it clear that a strike condition no longer exists. As about ninety per cent of our former employees are no longer available, having left the district, we are now starting to operate with a few of our former employees and with returned soldies to whom the arguments of the socialists have no appeal.

"The clique of socialists are endeavoring to dissuade these men from working here and, by the usual devices of placing pickets at the railway stations and along the road to Kirkland Lake, are trying to prevent men that we engaged at other places from coming in to work by calling them strike-breakers. Our answer to this is that the men we are now engaging are the real employees who will have permanent employment in this district, and, the socialists, by their unfair tactics and greedy scheme to create a monopoly of labor here, have forfeited any right they may ever have had to be considered as our workmen. To any of our former employees who may wish to return to work, we say the door is still open and you may disregard the loose talk and propaganda of the socialists with whom we will have no further dealings whatever. Our fight is not nor has it ever been, with unionism, as the term is now generally understood. On the contrary, we want to give our workmen an opportunity to cooperate with us in the upbuilding of the mining industry of this district. We have, however, taken a decided stand against the rabid type of socialism that has been preached by certain members of the community here and, as patriotic Canadians, are not going to have this poisonous social weed continue to grow in our midst. We therefore bespeak the support and influence of all those in the north country who feel as we do in this matter in counteracting any propaganda which may be set at work by the radical socialists."

Silver Shipments From Cobalt.

During the week ended October 10 six Cobalt companies shipped an aggregate of sixteen cars containing approximately 1,410,229 pounds of ore. The Nipissing with seven cars containing 630,479 pounds headed the list.

The following summary shows that ore shipments have been assumed such proportions as to compare favorably with any period during the past year or so:—

Shipper	Cars	Pounds.
Nipissing	7	630,479
Buffalo	3	263,155
McKinley-Darragh	2	190,875
Coniagas	2	129,927
La Rose	1	99,232
Beaver	1	96,561
Totals	16	1,410,229

During the corresponding period no bullion shipments were made. On October 11th, however, the Nipissing sent out 75 bars containing 100,482 fine ounces.

The Kerr Lake Statement.

During the fiscal year ended August 31st the Kerr Lake mine produced 1,482,649.40 ounces of silver, in addition to which was 90,586 pounds of cobalt and 137 pounds of mercury. This is inclusive of 154,682 ounces of silver on hand August 31st, 1918. Ore reserves are estimated to contain at least 500,000 ounces, as shown in the following explanatory paragraph:—"At the present time we do not consider it advisable to estimate ore reserves in detail inasmuch as it would be difficult to estimate with a reasonable degree of accuracy the future production of the property. However, under the present conditions, we estimate ore reserves to be approximately 300,000 ounces silver in high grade ore and 200,000 ounces silver in low grade milling ore, with a possibility of developing further values of real importance."

The report further states: "On July 23rd all miners of the Cobalt district went out on strike and although our men apparently had no grievance against the Company they struck with the other miners. This strike lasted until September 7th. On that date the miners returned and operations are now resumed."

Mining and development costs amounted to a fraction under 17½ cents an ounce, shipment and treating charges amounted to a fraction under 20 2-3 cents an ounce, while administration and general expense amounted to 2 4-5 cents an ounce, making a total cost of 40 4-5 cents an ounce.

Regarding development work, H. A. Kee, manager, states that during the year 2,382 feet of development was done by drifting, crosscutting and sinking, all of which failed to encounter new veins of importance, although commercial values were exposed in extensions of ore shoots, portions of which were previously located in known veins.

It is very interesting and encouraging to note that about two-thirds of production came from high grade ore, and that even of the ore in reserve about three-fifths is composed of high grade ore.

The financial statement shows that $600,000 was paid in dividends during the year in addition to which was $22,152.90 carried to balance, making a surplus of $657,641.43.

PLANNING LARGE MILL FOR ASSOCIATED GOLDFIELDS.

Details of Operations on Big Property at Larder Lake —Spent Nearly $1,000,000.—What Company Says.

"Associated Goldfields Mining Co., Ltd., Larder Lake, is undertaking something that has never before been attempted in Ontario, namely, mining large bodies of so-called low-grade ore on an enormous scale. Before the discovery of present-day methods of gold extraction this would have been an impossibility, but to-day such mines as the Treadwell of Alaska, working on ore that does not average over $2 per ton, and the Homestake Mines of Black Hill, South Dakota, where the ore does not run over $3 per ton, and the Rand Mine of South Africa (also low grade) are paying their shareholders millions of dollars in dividends yearly. Associated Goldfields assays have averaged well over $5 per ton.

This Ontario corporation (and the great body of its stock is owned in Ontario) was organized in 1914 by the amalgamation and purchase of several of Larder Lakes largest and most promising gold claims, altogether about 2,000 acres of properties, 1,600 comprising

actual claims, and the balance water-power rights-of way. Upon the advice of thoroughly competent mining engineers a plan of development and financing was inaugurated, and it is being consistently followed. This plan was to thoroughly block out the ore bodies on three of the properties, blocks "B," "C" and "D" formerly known as Harris-Maxwell, Kerr-Addison and Dr. Reddick Mine, respectively, by means of shaft sinking, drifting, diamond-drilling and surface exploration, and ascertain how much tonnage was in sight, and its actual value in gold content.

To do this required an enormous amount of money, and as the market was practically dead during the war it was decided to sell stock by private subscription, rather than list it on the open exchange (no money has been paid out for advertising), and the wisdom of their decision is proven by the fact that the bulk of the shareholders, numbering upward of one thousand, are composed of substantial business men and investors, who have either investigated and visited the camp themselves, or taken the advice of those who have, the list also including several mining engineers, contractors, men in charge of the work, a large percentage of the miners themselves and all salesmen selling stock.

Spent Nearly $1,000,000.

Almost one million dollars has already been spent in installing the water-power plant, over twenty-five miles of transmission line, forty miles of private telephone lines connecting the different properties, building sawmill, planing mill, bunk houses, installing machinery, and actually developing and blocking the ore bodies. The bunk houses just being completed at Block "B," to accommodate an additional one hundred and fifty men (over one hundred are now at work on the different properties) will be heated by hot water, have hot and cold baths and all accommodations, and it is planned to duplicate these at once on Blocks "C" and "D."

The actual development work consists of sinking a shaft on Block "B," the Harris-Maxwell (a hill of ore 1,000 feet long by 130 feet wide, rising 100 feet above lake level), to the 500-foot level, cutting an adit or tunnel directly across the body at the 100-foot level and drifting and cross-cutting through tunnels 8 feet by 7 feet for a distance of 1,500 feet at the 500-foot level, where the body has proven to be over 300 feet wide.

While for obvious reasons it is inadvisable for the company to publish its assay charts—and is not the custom to do so—its engineers have actual proof that every ton of ore can be run through the mill at a profit that compares favorably with other mines, and justifies it in planning a mill on the property that will handle 5,000 tons of ore per day, which is larger than any two mills in Ontario. This mill will be erected immediately the development and blocking out of the ore are completed, and the work is being pushed day and night.

Between seven and eight miles away, passing by over thirty of the company's other claims, is Block "C," a huge hill of mineralized rock or ore, 1,250 feet long, about 300 feet wide at the surface, rising about 300 feet above lake level, entirely free of overburden, and proven by means of diamond-drilling to be over 500 feet wide at the 500-foot level, and stated by engineers and men who knew to be one of the largest low-grade ore bodies in the world. It is now being explored by diamond-drilling and surface pitting and blasting, and from indications, every ton of this ore can be run through the mill at a profit, and the plan is to immediately erect a 5,000-ton mill here, which will also treat the ore from the Dr. Reddick, Block "D," which adjoins, and is a continuation of Block "C." On this property is located an air compressor capable of operating twenty-five drills, and the development work consists of sinking a 100-foot shaft and about 1,200 feet of drifting.

Gold for Canadian Coins.

"Block "D" is traceable on the surface for about 1,600 feet, and is in places 150 feet wide. It is said to enjoy the unique distinction of furnishing the gold from which the first Canadian coins were minted at Ottawa. The ore here is of a high quality, and some of the veins have proven to be over forty feet wide. Ore showing free gold is found here in abundance; in fact, it is to be found in all three bodies, over large and widely separated areas. While ore showing spectacular patches of free gold, as one critic puts it, does not make a mine, it is a pretty good indication that there is gold present, and justifies the opinion that there is more in the immediate neighborhood.

Metallurgists at Work.

Associated Goldfields assays have been taken from ore that does not show free gold, all such being discarded, and to do this work it has a modern chemical laboratory and furnaces right on the premises and under the direct supervision of Mr. A. J. Moore, a well known mining engineer, metallurgist and chemist, who has had charge of some of the largest mining operations in United States and Mexico. Mr. C. G. Dalmpre, also a man of wide experience, is general superintendent and manager of all the work, and the mine captains and foremen are all experts in their line.

The water power, which is estimated as capable of developing 10,000 h.p. without damming, will not only furnish all the power for running the mills, sawmills, electric cranes and shovels, lighting plants and so forth, but will also supply mines in the neighborhood at a profit which will actually make it a dividend-paying asset. The Huronia Mine is to-day using Associated Goldfields current.

Financially the company is now on a firm basis, with over $600,000 cash and Victory bonds in the bank and on hand."—Toronto "Globe."

Personals.

Col. H. H. Johnson, of the Tough-Oakes Gold Mines, has returned from England where he spent the past few weeks on business.

Mr. Dickson, manager of the Temiscaming mine has returned from a brief business trip to southern points.

Lady Rhondda Visits Peace River Country.

Sir Humphrey Mackworth, Viscountess Rhondda, and the latter's mother, Lady Rhondda, has returned after a trip through the Peace River Country, where the Viscountess has extensive coal properties, left her by the late Viscount Rhondda. While she has said little of a definite nature as to plans of development, it is understood that the Rhondda Corporation has important plans under consideration. It is reported that the British Columbia Government is to be asked to provide a good road over the Rocky Mountain portage to permit the introduction of motor trucks to partly solve the problem of transportation from West of the Mountain to Hudson's Hope.

BRITISH COLUMBIA.

The Collieries.

A new agreement has been entered into between the underground employees of the Canadian Western Fuel Company, of Nanaimo, B.C., and the company, the terms of which, under conditions prevailing before the war, would have been considered out of the question. Briefly the wages granted the miners represents an all-round advance as to the base day rate of 35 per cent and the continuance of bonuses, granted from time to time with the increase in the cost of living, amounting to $1.50 a day. The base rate for coal miners working by the day heretofore has been $3.15. Since the war started an increase has been allowed of 35 per cent, which subsequently was enlarged by three bonuses of 75c, 50c, and 25c. The pact now approved established a new base rate of $3.15 plus 35 per cent, or $4.25¼. This, of course, is unalterable. Allowance is made for present abnormal conditions as to the cost of the necessities of life by adding to the figure last named the total of the several bonuses referred to, namely, $1.50. This amount may be reduced as the cost of living declines. The situation of the coal miner who is put on day labor, therefore, is that he must get at least $5.75 a day. The fireboss receives approximately $6.42, which for a 30-day month would amount to $192.60.

These figures speak for themselves. In comparison with wages paid in pre-war days they appear startlingly large. And it must be remembered that they apply, not only to the Canadian Western Fuel Co., but to all the collieries of Vancouver Island and, in almost an equal degree, to those of other sections of the Province. A prominent official of the Canadian Collieries (D) Ltd., in discussing the wages question the other day stated, off-hand and in general terms, that the increase of recent years aggregated 72 per cent of the salaries paid before the war. It is interesting comment, in this connection, that the coal miners of Vancouver Island, who are unorganized and who have been getting along with their employers in an amicable manner, are doing slightly better than their fellow craftsmen of the Crow's Nest Pass District, who are well organized and who only a short time ago returned to work after a long drawn out and more or less indeterminate strike.

To return to the Canadian Western Fuel Company and its men, there are some of the terms of the agreement referred to which was signed by G. W. Bowen, managing director, and John Hunt, superintendent, on behalf of the company, and by the members of the Men's Committee, which are worth special attention. After outlining the wage schedule, a summary of which has been given, it describes the system of Dockage Inspection to be instituted at the Company's various mines; gives a schedule of pay for the loading of coal after machines; and then takes up the basis on which the men and the management propose to work in settlement of all possible disputes without rupture. The latter, probably better than any other clauses, illustrates the good feeling which exists between the employed and the employer in respect of this company. It reads:

"The company will meet the Agreement Committee, or a sub-committee thereof, on matters relating to this agreement, or any new matters changing the status thereof, or to adjust any matters in dispute between the employees and the mine officials, it being distinctly understood that there shall not be any stoppage of work by employees individually or collectively, pending the hearing of and adjustment of any dispute or grievance during the term of this agreement."

A date is set for monthly meetings between the management and the Agreement Committee; provision is made for the calling of special meetings; end it is declared that the agreement, which shall subsist for three years beginning October 1st, 1919,

"shall be binding upon and respected by the company and its successors, and also shall be binding upon and respected by all employees, who before accepting employment shall endorse the agreement by their signature in a book containing a copy of this agreement and kept in the company's office."

It also is provided that, in the event of a fatal accident in the mine, although no holiday will be permitted on the day of the funeral, those who wish may absent themselves from work. All employees in the mine in which the fatality occurred, and who work either on the morning, afternoon or night shifts of the day of the funeral, agree to contribute 50c per man and 25c per boy to a Joint Fund, the company undertaking to duplicate the total of the employees' contribution. The fund thus collected shall go either to the widow, or to the children under sixteen years of age if there is no widow, or to the mother, or to the father, should there be no widow or children, or, in case of there being no dependents, it shall go to the Medical Relief and Accident Fund of the Underground Employees. And it is clearly explained that relief from this source in no way affects claims dependents of employees might have under the terms of the Workmen's Compensation Act.

Henry Devlin, who has been an Inspector of Mines in British Columbia since February, 1913, has resigned in order to take a position with the Canadian Collieries (D), Ltd. Previous to entering the civil service, Mr. Devlin was mine manager at South Wellington, Pacific Coast Mines.

Dudley Michel, who for five and one-half years has been attached to the staff of the Department of Mines, British Columbia, as Instructor and Organizer in First Aid and Mine Rescue Work, has left the service. He is taking a position with the Giant Powder Company.

The Reserve Mine, Canadian Western Fuel Company, Nanaimo, B.C., recommenced operation on the 1st of September after a short period of idleness. David Brown has been appointed manager of the mine and Francis John. overman. With this property again on the producing basis it is expected that the output of the Western Fuel Company will show substantial increase.

THE METAL MINES.

Reneta, B. C.

A two drill compressor is being installed at the Mountain Chief Copper Property. Development is making good progress, states J. W. Evans, the manager. From the bottom of the shaft a drift is being carried both ways, and the ore has been exposed on that level for 25 feet. More of this work will be done before sinking is resumed. The bunkers have been filled again, a recent shipment to the Trail Smelter having emptied them, and the ore is maintaining its character, namely, chalcopyrite with a substantial percentage of bornite.

Nelson B. C.

The Gold Plate or Hummingbird Group of Mineral Claims, situated at the head of Roaring and Five Mile Creeks, are being opened up again, development work having been started recently by the owners. One of the men, in cleaning out the shaft, picked a gold ungget from white quartz. It was not large but the incident is considered a good omen and operations are to be continued until something more definite is known of the possibilities of this property.

Ainsworth B. C.

Shipments from the Cork-Province Mine have been suspended, the large carload of concentrates, having left the mine in August. The explanation given is that equipment is being awaited, the chief requirement being a cable for the tramway. Meanwhile considerable ore has been accumulating, there being several carloads of concentrates and a carload of ore on hand. It is estimated 500 tons of zinc concentrates are in the bunkers. Those interested in the Cork-Province have been much encouraged by the recent report of R. H. Stewart, consulting engineer, who recommends that $100,000 be invested in the development of its property in the Slocan District. Mr. Stewart proposed that a shaft should be sunk and equipped, that additional power be provided for hoisting, that drifting and raisen be undertaken on the new level, and that prospecteing and development be continued on the present working level. He also refers to possible additions to the Mill to provide for further fine grinding and handling of middling and tailing products.

The Lincoln Group, situated one and one half miles south of Blaylock, Ainsworth District, and which now is held under bond by J. H. Tompson and associates, is being developed to such advantage that the uncovering of a four foot vein of shipping ore is reported, the greater part being galena. It is said that the whole will average about 40 per cent lead with good silver values. This is an old property and the showing made as a result of the comparatively small amount of work done up to the present has created much interest throughout the district. One car of heavy ore was shipped last fall, the returns being satisfactory. This encouraged Mr. Thompson et al and operations were continued, still on a small scale. The hopes of the owners having been realized thus far, arrangements are being made to ship three cars of ore at an early date and a larger camp is projected for next Spring.

The Highland Concentrator, Woodbury Creek, Ainsworth, is in operation again after being idle for seven or eight months. It is handling ore from the stopes of the Highland Mine. While the latter has not been producing until recently, it has been under development constantly. This propert ybelongs to the onsolidated Mining & Smelting Co. of Canada. The Company has extended the area of its holdings by the acquirement of a number of claims adjacent to the Highland Mine, so that there is every prospect that this well-known silver-lead property will be a regular producer. An effort is being made by operators of other Ainsworth properties possessing milling ore to have the same treated at the Highland Concentrator.

Revelstoke B. C.

There are indications that the property and plant of the Multiplex Mining Milling & Power Co., Camborne Camp, are attracting the attention of possible investors of the Pacific Coast as well as of the adjacent Prairie Provinces. O. B. Bibb, who is associated with the Company, recently escorted a representative party of Vancouver citizens over the property.

It is confidently expected that important developments will take place shortly at Camborne. In this connection it is interesting to refer to the Gold Commissioners report of 1918 in reference to this property. He said:

"The Multiplex Mining Company, which has been the largest operator in the Camborne Camp during the past few years, ceased active work early in the year owing to conditions which made it impossible to get sufficient help from the economic working of the property. Up to date this Company has expended upwards of $25,000 in actual mine development, and the property now is in good position for future operations. It is understood that the finances of the Company are in good shape for this year and a vigorous development policy is planned. It is understood it is the Company's intention to construct a concentrator this year. It is likely to be a customs concentrator, and will be of great benefit to the small mine owner."

Merritt B. C.

The Chataway Mine, Highland Valley Mining & Development Co., is to be developed on a considerable scale. Title to the property has been secured and funds are available for an immediate resumption of operations. The mine and mill of this Company operated during 1917, producing over $100,000 net smelter returns. In January of last year the mine was closed for a number of reasons, chief among which was the necessity of meeting payments on the purchase of the Chataway Group. After meeting this funds were not immediately procurable to keep the development of the ore reserve ahead of extraction and development fell behind. Another reason given is that as ore would have to be mined below the adit level further plant was required. The year's experience also had clearly proved that to make satisfactory profits the tonnage mined and milled would have to be increased from about 35 tons daily to 100 tons at least. This, it is understood the directors now are in position to undertake and, as stated, work will proceed. The chief value of the ore lies in its copper and what is now exposed is about the best uncovered on the property. The vein maintains its full width and quality and the intention is to sink to depth on this ore body. The Snowstorm Group, on which the Provincial Government has been doing some diamond drilling, is situated in the vicinity of the Chataway.

Barkerville B. C.

Mr. R. A. Bryce, representing Toronto and New York capital, has secured an option on the Porcupine quartz holdings in the Barkerville district. The deal is the largest one comprising the Independence Group of three claims, owned by E. E. Armstrong, and the Imperial group of five claims owned by F. J. Tregillus, P. Carey and J. H. Blair. The price ranges into six figures and will mean much to the mining activity of this district.

The property contains gold-bearing quartz, there being apparently two large veins striking in a north-westerly direction as well as smaller ones. Mr. Armstrong first discovered these veins by an ingenious method of pan prospecting, making a systematic search by panning from the creek beds up the mountain sides. Once above the ledges the pan prospects disappeared, indicating he had reached a point above the veins. In this way the original discovery was made.

Using this method Messrs. Carey, Blair and Tregillus located a number of claims on the strike and after several seasons of prospecting and crosscutting picked these veins up, approximately 4000 ft. north-westerly, also a number of other veins.

A force of men will be employed immediately to develop the claim.

Victoria B. C.

Labor troubles have closed down operations on three of the most important of British Columbia's metalliferous mines. Two of these are situated in East Kootenay, namely, the Sullivan Mine, owned by the Consolidated Mining & Smelting Co. of Canada and the largest silver-lead-zinc mine in the world, and the North Star Mine, Kimberley, which has been shipping regularly to the Trail Smelter. The third is the Nickle Plate Mine, owned and operated by the Hedley Gold Mining Co. Ltd.

The Hedley Mine has been the greatest producer of gold in British Columbia for years, which position it held until the Surf Inlet Mines began operating on a considerable scale two years ago. The production has averaged around $700,000 a year. The ore is arsenopyrite and the Tacoma Smelter, which has been treating the concentrates, has been paying as well for the ascenic content during the past two years. Ore valued at between $4,000,000 and $5,000,000 is in reserve. With the fall in the purchasing of gold and the increased cost of production of late the Company's profits have been seriously affected. On top of this came a demand for an increase of wages from the miners and fifty cents a day was granted. A like amount again has been demanded and the directors have decided that, as this would mean operating at a loss, to close the mine and mill. As a result a force of about 100 miners will be thrown out of employment, a small force only being retained on development.

The Sullivan Mine is the chief source of zinc for the Trail Smeltery, the production of which is between 18,000 and 20,000 tons of zinc per annum. It is observed that the strike of the miners and the consequent practical closing down of the mine is likely to interfere with the Company's taking advantage of its agreement with the Dominion Government, which is a part of the war supply contract and under the term of which the smelter received a minimum price of 8 cents per pound for its zinc.

At a mass meeting of the miners of Kimberley matters relating to the strike were discussed. Negotiations looking to an adjustment have been conducted through a representative of the Department of Labor, Ottawa, a proposal being made to the men that, if the One Big Union was repudiated, the companies would be prepared to meet a committee of the employees. The appointment of a Board of Conciliation under the Industrial Disputes Act was the method suggested as being most likely to effect a settlement. However, while the Miner's Committee claimed it did not represent the O. B. U., the miners in attendance declined to give an undertaking that they would repudiate the One Big Union. Consequently negotiations ceased. The Government representative has returned to Calgary and the companies are said to be preparing for a long strike.

Alice Arm B. C.

With the Dolly Varden Mine and Railway in operation, and regular shipments being made from the latter property, together with gratifying reports as to the development of other properties, the season is drawing to a close in the Alice Arm Section of Northern British Columbia in a manner that argues well for the future. The North Star Mine has procured horses with which high grade ore, taken out during the summer, will be packed to the railway. If transportation can be secured, and there is every reason to believe that it will be available, $30,000 is expected to be realized from these shipments. This property has been developed to a considerable extent, a tunnel having been driven which is reported to be all in ore having a substantial content of native and ruby silver. A vein has been opened on the Muskateer, owned by Mr. Meenach, of Seattle Wn., of which very favourable reports are received. Samples taken from the open cut are said to have given value of $200 gold and 135 ozs. silver. The Tiger and Last Chance Mines also are looking well. Messrs Price and Crawford, of New York, are reported to have acquired the former, the consideration being $125,000 while the latter also is said to be controlled now by New York people. The Homestake Prospect, owned by Seattle interests, is promising. It is stated that on a property adjoining the latter free gold has been found. At the United Metals Mine are two pack trains of twelve horses each engaged in transporting ore which is expected to average 200 ozs. silver, $13 gold and 45 per cent lead.

BOOK REVIEW.

The Iron Hunter, by Chase S. Osborn. MacMillan Company, New York. Cloth 5½" by 8", 316 pp., illus.

This is an unusual book, and after reading it one realises that its author must be an unusual man. The book is actually an autobiography, of the kind that might be expected from a man who made his way by personal endeavour from a penniless condition to Governor of Michigan and a candidate for President of the United States. Mr. Osborn, writes: "For forty "years now I have lived in the robust north, and in "Winter I have taken a run naked and rolled in the "snow every morning before breakfast, when in the "woods, say at four o'clock. In all that time I have "known of only one young man who would follow "my example, without being ridiculed into it or com-"pelled in some way." One can quite credit the statement.

The author claims to have visited virtually every accessible iron-ore deposit in the world, and his travels include a journey by reindeer sled across Lapland, in February, and trips to Madgascar, Africa, Burma, Ceylon, Cochin-China, Turkestan, and Persia, all connected with the hunt for iron-ore that Mr. Osborn conceived as his life work. An interesting reference to Madagascar contains an intimation that the author

is aware of the location there of a vast deposit of iron ore containing metallic iron of 64 per cent and nine-thousandths of one per cent of phosporous..

But the most interesting references to Canadian readers in this kaleidoscopic recital are in connection with the north shore of Lake Superior, and Mr. Osborn is unstinted in his praise of the open spaces and clean wildernesses of our Canadian Northland. "North of "us lies the vastest unexplored territory in the world. "I refer to the Dominion of Canada. It is rich, and "where it is untouched by man, it is clean. There "is not a drop of unwholesome water nor any poison-"ous insects nor reptiles between Lake Superior and "the aurora borealis." Mr. Osborn has the blood of the prospector in his veins, for he remarks: "I think "the greatest charm of prospecting is not the hope "of finding wealth, it is the life in the clean unhurt "out-of-doors." Describing the north shore of Lake Superior he writes: "Olivines and epidotes make "floors of verde antique, and pegmatite shows red as "blood above and also below the waters." His description of the berries and natural beauties of this region are reminiscent of the writings of another poet turned geologist who has described Northern Cape Breton in the Geological Survey Reports of 1873, the late Hugh Fletcher.

A pleasing, and not overdrawn reference is to the work done in connection with the geology of iron ores in the Lake Superior country. "Such distingush-"ed names as Douglas, Houghton, Brooks and Pum-"pelly, Charles Wright, Irving, Symthe, Lane, Win-"chell, Chamberlain, Seaman, Van Hise, Leith, Hotch-"kiss, Merriam, Allen, Coleman, Miller and others are "familiar to those who are interested. At a time when "most of these men could have turned their knowledge "into money they have been ethical to an extent "that is praiseworthy. I do not know of one of these "who took advantage of his chance to make a profit; "not a single quack among them." And so say we all.

A further statement regarding the administration of Canadian mining law is interesting, coming from a man who is above all a typical citizen of the United States.

"I had heard" writes Mr. Osborn, "that nothing "could be obtained from the Government departments "at Toronto without paying for it; that from top to "bottom there had to be bribery. I saw nothing of "the kind during years of experience, and I do not "believe a word of it. The fees of Hearst and McKay "were reasonable, and they told me they never thought "of paying any "grease" money or permitting graft."

Our author tells of a "starvation hike" to an "iron dam" on the Vermillion River, of camping in such primeval wilderness that a bull moose walked over him while asleep, and winds up his chapter by stating:

"Where I slept in the little open shed tent, and was "unawakened by the moose that nearby stepped on "me, there is now a flourishing mining town reached "by a branch of a transcontinental railway. They "did not develop there without much hard and en-"joyable work." This refers presumably to Moose Mountain.

An anecdote of "Dan Mann" tells amusingly how the Canadian railwayman was challenged to a duel by a Russian count in China, and exercised the privilege of the challelnged to choose the weapons by selecting double-bitted axes, to the use of which the Russian, our author suggests wisely, demurred and the duel was off.

The book contains a full technical description of the mining and roasting of siderite at the Magpie and Helen Mines, and makes the observation that in this instance an elaborate and relatively costly mining and roasting system enriches from 30 to 50 per cent, an ore never before used in America, and it is done profitably. Reference is made to the astonishingly cheap and plentiful occurrence of iron-ore in the United States, and its effect on the relative value of lean ores. Our author pertinently remarks: "What are regarded "in the United States as lean ores are esteemed of "great value in other iron-making countries." Reference is made to an experimental plant at Duluth where Hayden Stone & Company enrich magnetic ores containing thirty per cent of metal to 62½ per cent by electrical treatment, which method alone, the author suggests "will make it possible to utilize the millions upon millions of tons of lean magnetite that belts Lake Superior like a containing encasement."

Mr. Osborn's unusual cast of mind is evidenced in his suggestion that a new and permanent standard for money could be found on the basis of calories. Gold, Mr. Osborn, contends, is not really a norm of permanent value, and the calorie does supply the markets and finances of the world with such a norm. Such a solution of the problem of coinage value fluctuation would not occur to the ordinary person. Mr. Osborn is evidently not an ordinary person, and his book is extraordinary, but well worth reading.

HERBERT HOOVER.

The engineering profession in the United States has conspired to do honor to Herbert Hoover. Canada also desires to be conjoined in appreciation of a man who has honored his calling, who has portrayed to the world the best and most lovable type of the citizens of the United States, and who is entitled to the admiration of brother engineers of any and all nationalities. As a successful mining engineer, as an author, and as a true friend of humanity, Herbert Hoover deserves all the honors that have been heaped upon him. The concluding words of the address of the Toastmaster at the dinner held in Mr. Hoover's welcome and honor, express a universal feeling.

"On behalf of this audience" said Mr. Saunders, "on behalf of all engineers, on behalf of a war-stricken people, who did not pray in vain 'give us this day our daily bread,' on behalf of all America, let me say to you in the words of John Milton, 'Servant of God, well done, well done!"

A REVIVAL OF TECHNICAL LITERATURE.

During the past five years the entire absorption of the energies of the British peoples in the defeat of the Teutonic League caused a dearth of technical literature and a great shrinkage in the number of papers read before British societies. A glance at the comparative bulk of the annual transactions of learned and technical societies will show the disparity between the fat tomes of pre-war days, and the lean volumes issued during the war period. This hiatus can unfortunately never be filled in, for many of those who showed promise in scientific and technical investigation form part of the awful toll exacted by war, and will never again move amongst us. It is said that on the opening day of the 1916 Somme battles no less than 170,000 British casualties were recorded, and the flower of the nation died in that and other battles which—although we did not then know it—broke the power of the German army, henceforward only to be prolonged by collapse of our allies in other fields.

While a certain amount of scientific progress has been occasioned by the necessities of warfare, who can say how many undiscovered men of genius, how many inventions, and how much of value to science was destroyed by the deaths of war? This chapter can never be written, but we do know that the best, the bravest, and in many instances the wisest of our young men perished untimely.

Acknowledgment of this irreparable loss has formed the theme of resolution and memorial at all our society meetings held since the war ended, and in looking forward to a revival of society transactions to an extent that will in some measure approach pre-war dimensions, we cannot forget that we shall never recover in the present generation of men, the labours and discoveries of those who have died in war.

We should however, expect very shortly to see the reading of a larger number of technical papers before British societies, and a resumption of that gift for individual observation and research which has enabled the British citizen to send home to the particular technical society to which he may be most particularly attached, accounts of technical progress in every quarter of the globe. This wide range of origin has always been a distinguishing feature of the transactions of societies within the Empire, whether they have their headquarters in South Africa, Canada, Britain, or elsewhere under the Flag.

One result of the war has been the description before our societies of war, adventure and shrewd commercial and technical observation combined, in the remotest and most primitive countries. Now our scattered armies are returned home, and men, after a period of unsettlement and re-action which varies according to the war experience and spiritual make-up of the individual, are settling down to the tasks of peace. Many men look upon the war period as so much time wasted, as a dirty business which had to be done; and which they have well performed, and they return to scientific occupations with renewed love. They will find in work the forgetfulness they desire of things that were unspeakable, and dear only to memory because of the comradship, of those who fought side by side with them, and went through the same hell together. From these men we may expect great things, and not the least of their contributions to our life in peace-time will be their contributions to society transactions, and their presence at our society meetings, as was their wont in the days before the War.

The tremendous and sustained bulk of scientific transactions in the United States is an evidence of the comparatively smaller drain which the war made upon the man-power of that nation, added to which was the selective nature of the drafting for war, which purposely retained at the desk and the laboratory those whose scientific attainments and promise indicated the most effective manner in which these men could serve their country. The tragic feature of the war as it affected the British peoples was that before conscription was adopted, by a natural selec-

tion of the most discriminating kind, the golden youth of the Empire were placed in the forefront of battle, and died there.

That the transactions of our technical societies were kept going at all was in large measure due to the fathers of the societies, who renewed their youth and played the game at home by contributing papers, feigning thereby a detachment from the obsession of the war, which they did not feel, for in too many cases their sons were gone from them.

In the years to come the bound volumes of society transactions, as they stand in the bookcases, will remain a mute reminder of the manner in which the British peoples entered into a righteous but unwelcome war, and for the space of about five years did little else but fight and prepare for more fighting.

THE BOOM IN PULP AND PAPER INCORPORATIONS.

"Pulp and Paper Magazine" writes editorially:

"The future of our industries, dependent upon the forest crop, lies in the realization that timber is a crop, and that provisions must be made for raising trees according to scientific methods. * * * Without an insistent and intelligent demand by the public for a proper administration of forest resources, we may expect one or two generations of prosperity, and a future of industrial pauperism so far as these industries are concerned."

In view of the tremendous activity of pulp and paper, and the extraordinary speculation now taking place on the Montreal Stock Exchange in pulp and paper securities, it is reassuring to know that such a prominent exponent of the industry as "Pulp and Paper" is courageous enough to speak a warning word.

Recently we were favoured by a call from an eloquent salesman of a pulp product, who enlarged enthusiastically upon the digestive capacity of his company's mills, on the enormous amount of timber they could chew up in a given time, but when asked what provision for reforestation was being made by his people, the salesman was significantly silent, and stated this matter did not concern his end of the business.

"Pulp and Paper" states that a number of the larger pulp companies are co-operating with provincial and federal authorities in the matter of reforestation, and it is to be hoped such co-operation is effective and will be extended to all places in Canada where the country is being stripped of timber. No one, we imagine, wishes to see Canada denuded of her timber and pulpwood to feed the insatiable maw of the printing presses of the United States, but there is the gravest danger that this will occur.

The coal-mining industry is very much interested in the preservation of timbered areas for the supply of pit-timber. The available supply of suitable pit-prop timber is annually decreasing in the coal-mining districts of Canada, and its cost is annually increasing. As the facts regarding this phase of the question may shortly be the subject of official report, we do not at this time enlarge further upon the interest which coal companies should manifest in the provision of a future supply of pit timber.

Timber is a crop, a crop that is annually drawn upon in countries where scientific forestry is employed, but if ruthless stripping is indulged in, and no reforestation takes place, the possibility of future crops is destroyed, because the natural conditions of soil and moisture which are necessary to tree growth are irretrievably obliterated by methods which look only to immediate dividends and care not for the morrow.

ACTIVITY IN NOVA SCOTIA COAL TRADE.

For the first time since 1912 there are indications that some chastened optimism may be indulged in regarding the immediate future of the coal trade in Nova Scotia.

All the collieries report steadier work, and look forward to a fairly busy winter. Some of the reasons for better production may be reviewed.

Regarding the St. Lawrence market, the release of a number of the Dominion Coal Company's ships has permitted a certain tonnage of coal to be sent to the customary destination of Nova Scotia coal, and we look forward to a steady regaining of this market by Cape Breton mines, although the process will be a gradual one. The "Empress of France" recently bunkered at Quebec. As the "Alsatian" this vessel bears a proud war record, and many thousands of tons of Cape Breton coal did she burn in her frequent trips to Halifax. It was a strange commentary on the results of the war to see her being bunkered so far down the St. Lawrence as Quebec, with United States coal, under the supervision of officers all of whom bore some decoration or other reminder of their war services.

The European demand has helped the Nova Scotian mines, and the supplying of this market is hindered only by two factors, the availability of shipping and the matter of international exchange.

The resumption of production at the steel works, necessitating something approaching normal coke manufacture is probably the most important single factor in stimulating production. It was notable that during the recent short suspension of steel manufacture, the question of the disposal of slack coal assumed importance, and acted as a reminder that the genesis of the manufacture of steel in Cape Breton was a consequence of the necessity to dispose of the surplus slack coal associated with increased export shipments of coal.

The reflex of the demands of the bituminous coal-miners in the United States will have an important effect on the demand for Nova Scotian coal in Cana-

dian markets. Should a strike take place at November 1st, as seems now very probable, there will be grave interference with shipments of bituminous coal to Canada, but as the threatened strike is timed for first November, Nova Scotian collieries can not help very much, as River navigation will be closed, and the sending of coal to Montreal by rail is not a very feasible expedient.

The fact that demand is improving does not mean that great prosperity is about to visit Nova Scotia. The production for 1919, notwithstanding the probability that the collieries will work to capacity during the remainder of the year, will still be the lowest in a decade, and it is only by virtue of lessened coal production elsewhere that a sharper demand for Nova Scotian coal is now being experienced. The inefficiency of the working organization which resulted from the war, and the greatly increased cost of production which it, and the increased cost of materials has occasioned, are still in evidence. When trade conditions become settled elsewhere, Nova Scotia coal must compete with other producing centres, and the present temporary revival of demand does not justify the granting of still higher wages and still shorter hours which it is hinted the mineworkers are about to ask.

The "Journal" offers its congratulations to Prof. F. H. Sexton, the Director of Technical Education in Nova Scotia, and head of the Nova Scotia Technical College, on the honorary degree of D. Sc. from Acadia University, and LL.D. from Dalhousie University at its centenary convocation. These degrees were given in recognition of his work in technical education in Nova Scotia and in the vocational rehabilitation of disabled soldiers. We congratulate also the Mining Society of Nova Scotia and the Canadian Mining Institute on the honour conferred upon a member.

This recognition of Prof. Sexton is well deserved. He has carried the work of helping lame dogs over stiles to a praiseworthy degree, and because of the personal enthusiasm, clarid but optimistic vision, and the unremitting toil which he—and Mrs. Sexton also—have put into this self-imposed task of practical humanitarism, few men in Canada have deserved better of this country.

The work commenced by Prof. Sexton in Canada early in the war has been a pattern on which similar work in the United States and in Britain has been modelled.

Some optimists are unreasoning and unpractical, but Prof. Sexton, in a superlative degree, combines optimism with a practical genius for getting useful work done.

Prof. Sexton's work in technical education in Nova Scotia has been very successful, considering the entirely inadequate monetary appropriation available for secondary education in the Province.

An intimation has appeared in Canadian newspapers that the well-known emblem of the Prince of Wales' feathers with the motto "Ich dien" is taboo. We are glad to notice that whoever is in charge of the decorations of the C. P. R., Windsor St. Station in Montreal has had the good sense to ignore this gratuitous advice. One might well object to the Latin mottoes on regimental crests because Nero was a Roman. The incident which gave rise to the adoption of the words "Ich dien" occurred, "as every schoolboy knows" in 1346, and the connection with the events of 1914 is not strikingly apparent.

The spirit of those who would erase all teutonic language and symbols from English is the spirit of the Pharaoh who erased the cartouches of his royal predecessors from obelisk and pyramid, or of that Chinese autocrat of low origin who ordered that all literature should be destroyed because he suspected the literati were laughing at his rustic manners—as they probably were. Those who fought the Germans and destroyed their military lunacies would be the last to advocate such infantile action. One of the most nauseating things of the war period was the jejune inscriptions that were placed under war photographs in the half-penny illustrated papers published in England. Their untruthfulness roused the incredulity of the kindergarten. By the way, why not delete this word from our language?

At the recent convocation of Queen's University, the honorary degree of LL.D. was conferred upon Mr. G. H. Duggan, President of the Dominion Bridge Company, and Chief Engineer of the St. Lawrence Bridge Company, during the building of the Quebec Bridge. Mr. Duggan is a past-President of the Canadian Mining Institute and of the Canadian Society of Civil Engineers, and congratulation has already been extended to Mr. Duggan by the Montreal Branch of the Engineering Institute of Canada, and will doubtless be forthcoming from the Canadian Mining Institute. The Faculty of Queen's is also to be congratulated on having observed, what has apparently been overlooked by more august but less discerning bodies, that the erection of the Quebec Bridge was an outstanding and notable achievment in Canadian engineering annals, and of much greater value than many breweries and many newspapers.

BOOK REVIEW.

MILL AND CYANIDE HANDBOOK, comprising Tables, Formulae, Flow-sheets, and Report Forms, for the use of Metallurgists, Mill-men, and cyanide operators. A. W. Allen, London. Charles Griffin & Company. 4 by 6¾ in. 6s. Od. net.

This addition to Messrs. Griffiin's well-known series of technical handbooks is a practical compilation in handy form of the data required by those in charge of milling and cyaniding operations. A glossary and an index are added. A large part of the book is occupied by typical flow charts and by report forms.

A Lightning Visit to a Scottish Coal Mine

By A. W. SWAN.

The writer was recently able to visit one of the largest Scottish coal-mines while on a visit to the Old Country armed with an introduction from the Canadian Mining Journal to Mr. Kirkby, manager of the Wellesley mine of the Wemyss Coal Company. Mr. Kirkby was away at the time the letter was forwarded, but referred the writer to Mr. Brown, the colliery manager, and thanks are due to both gentlemen.

The Fifeshire coal-mines of Scotland are comparatively speaking, a new field, and have scarcely reached their full development. One of the largest companies operating the mines is the Wemyss Coal Company which works the rich mines on the property of the Earl of Wemyss on the Fifeshire coast of the Firth of Forth, the boundaries of the property being roughly from Dysart (Kirkcaldy) to Methil, the great coal-port, a distance of seven miles, and a couple of miles inland. The largest of the Wemyss mines is the "Wellesley pit, ' and it was to this pit that the writer was directed. A number of villages lie between Dysart and Methil, and as the train service is rather indirect from Edinburgh the writer took his trusty bicycle and followed the familiar road from Burntisland through the "Lang Toun" of Kirkcaldy. By the way, a native of Kirkcaldy in Montreal would have a touch of homesickness as he passed along Notre Dame towards Maisonneuve by the linoleum factory—Kirkcaldy manufactures a large proportion of the world's linoleum, and the factories have a smell that is almost as distinctive as that of a pulp-mill.

"Are you the American that was to see over the pit?" Thus Mr. Brown at the Wellesley pit office—on the discovery that the writer belonged to Edinburgh, had spent several summers on the Fifeshire coast, etc., relations became more cordial. "Tell the other girl to give the gentleman's bicycle a wee bit clean."

The Wellesley pit is not only one of the largest mines in Scotland, it is also extremely well equipped. The output of the mine is increasing, and the coal measures are not fully developed. As the present output is in the neighbourhood of 5,000 tons per day, it can be seen that this is no small mine.

In order to handle the double-deck cages with the maximum of dispatch, pithead and pitbottom are being equipped with two landings so that hutches can be unloaded and loaded for both decks simultaneously. At the pithead the hutches (half-ton) are distributed to the various tipplers where their contents are discharged on to slowly moving belt conveyors. On these conveyors the coal is hand-picked, all the smaller coal going to the large washing plant. This work (picking) is done largely by women. The narrow gauge hutch tracks from the tipplers meet, and the hutches are brought back to the "empty" side of the pithead by a chain creeper haulage. With this arrangement the hutches pass around the pithead without needing any physical work on the part of the workers beyond setting the switches, etc. At the pit-bottom the arrangement is somewhat similar, that is, there is a gravity distribution of the empty hutches around from the shaft to the various main galleries which are generally equipped with cable haulage. As the general slope of the main galleries is down towards the pit bottom, power is used only in hauling the trains of empty hutches to the working face. With this extensive use of cable haulage there are few ponies used in the mine; at the time of the writers visit there were only thirteen in the Wellesley pit.

The engine equipment at the pithead is remarkably complete. Exhaust from the winding engine goes to a turbo-generator, and from this to the condenser. Superheated steam is used at 150 lbs. pressure, the equipment also includes economiser and spray cooling pond for the condensers. With such a complete equipment it is not surprising that power is generated at a remarkably low cost, the estimated cost of electric power being ½ cent per K.W.H., which is somewhat remarkable at the present high pithead cost of coal.

The winding engine is of 4,000 H.P. constructed by a Kirkcaldy firm of engineers, cylinders 38 in. diameter (non-compound), and powerful enough to handle considerably in excess of the present maximum load. The present depth of working is 1500 ft., the time for the hoist being 50 seconds. The winding engine has the usual control of throttle, reversing gear and brake, the latter being compensated. A simple over-winding gear trips throttle and brake should the engineer fail to slow within a certain distance of the pithead. In addition tc the Parsons exhaust steam turbo-generator there is a Curtis turbo-generator and also three Belliss and Morcom 500 H.P. generating sets, one of which has been in operation for fifteen years. The current is generated at 6,600 volts three phase alternating, and is stepped down in the pitbottom sub-station, the main use for the power below-ground being for pumps and the numerous haulages.

The descent in the cage to pit-bottom was remarkably smooth, quite as smooth as in any of the modern elevators in New York. Around the pit-bottom the main galleries are electrically lighted, but this system does not extend far from pit-bottom. The mine, like most of the East of Scotland mines, is free from gas, and the miners use little oil lamps which they usually wear in their caps. Near the pit-bottom is a large pump house containing a large steam plunger pump—supplied from the pithead boilers, and two electrically driven Sulzer centrifugal pumps of 500 G.P.M. capacity. At this point the writer was introduced to one of the "oversmen" or foremen who was to be guide at one of the working faces.

The Wellesley pit is for the most part under the Firth of Forth, the shaft being practically on the foreshore. As far as is known at present the Fife coal seams pass right under the Firth of Forth, re-appearing in the Haddingtonshire coal-mines on the south shore of the Firth. At present the workings reach out a considerable distance, but the problem is somewhat that of the Nova Scotia coal mines, in that the further the seam is followed the deeper the mine goes, with a corresponding increase in difficulty of winning the coal. However, the Wellesley pit is only in its early stages, and judging from the cross-section in the main office, there will be no lack of coal from this particular mine for a long time to come. As a rule the coal-seams in British mines are thin, but a number of the seams in the Wellesley run up to 4 ft., and sometimes more, so that they are frequently worked in two layers.

From pit-bottom to the working face of the Chemiss seam which the writer visited is a mile walk along one of the main galleries having one of the haulages. This seam is being worked on the retreating longwall system. Mr. Brown, the manager, has introduced "hydraulic scouring," which he finds very useful in reclaiming coal from the "red" or waste, and also very useful in case of any section taking fire. Although the mine is free from gas, fires will occur occasionally due to settlement, and in such an event the only remedy is to isolate the section.

Compressed air is not used to any great extent either in this or other Scottish coal-mines, there being only one small compressor near the pit-bottom to supply air to the hammer-drills used in tunnelling in the rock. The longwall system of coal-working is suitable to the chain and disc type of coal-cutters, and the Wemyss Coal Company has been experimenting with both, although the experiments have not yet reached the final stage, and the great bulk of the coal is mined by ordinary pick and shovel. However, as in many other industries in Great Britain it is not entirely fair to blame the management; the use or non-use of labor-saving machinery depending very largely on the attitude of the labor union heads. The Wemyss Company has just completed a twelve months' test of a chain coal-cutter, but has not found it satisfactory, and is now trying a disc machine manufactured in Scotland, so far with success. The writer did not have time to make a detailed examination of this machine, and the only light available was a smoky little oil lamp, but roughly speaking the disc machine is similar to the same type as manufactured in America, the body of the machine resembling a small mine locomotive, and the disc with its picks set in the periphery, projecting from the body. The feed is by a cam and ratchet arrangement, the amount of feed being varied by controlling the number of teeth caught at each move forward. The feed is also controlled by a clutch which is automatically thrown should the picks suddenly strike hard spots in the coal.

The working face "oversman," Mr. Briggs, took the writer for a quarter of a mile scramble through the working face.

The return to pit-bottom was made at one o'clock, "knocking-off time," and to get into the cage it was necessary to get a brass check from the office near the shaft, and wait for that number to be called out as only 16 men are allowed on each deck of the cage.

COAL NEWS FROM ALBERTA.

Coal Commission Sits in Edmonton.

Some interesting evidence was given recently at Edmonton, Alberta, before the Coal Commission, appointed to investigate conditions with reference to the available supply of this fuel, cost of production, etc. G. G. Sheldon, of the Humberstone Coal Co.; W. S. Cupples, of the Great West Coal Co.; H. C. Anderson, of the Twin City Coal Co.; L. E. Drummond, of the Mountain Park Coal Co.; and W. C. MacKay, of the MacKay Coal Co., were among those heard. All the operators were agreed that there was a great overdevelopment of the mines in the district; the fact that they only work five or six months in the year was a big factor in the cost, for the upkeep during the remainder of the year had to be borne by the coal produced during the short producing period of the year. They also agreed that there would be much benefit in the marketing of coal by the standardization of screens, and this was especially true when catering to a competitive market such as that of the Province of Manitoba. The quality of coal being shipped into Manitoba should be very carefully controlled. The operators felt that there was as much reason for the standardization of grades in coal as with wheat, butter, or other products made for export or even for home production, as the satisfaction of the consumer was so much greater. Another suggestion was the appointment of a Commission to regulate and control the opening and operation of coal mines in the Province of Alberta. There should be some man, it was argued, with authority along the lines of the Railway Commission. To this Commission one proposing to open a coal mine would have to show that he was financially able, not only to open the mine, but to sustain operation of the same for such period as might be considered necessary to get it on its feet. The standardization of export coal also would be a matter for the attention of this Commission. Evidence also was taken with reference to housing accommodation at coal mines.

GOVERNMENT RESERVE COAL AREAS IN SMOKY RIVER DISTRICT, NORTHERN ALBERTA.

With a view to creating a coal reservation in Northern Alberta, coal mining rights have been withdrawn in regard to a district near the junction of the Muskeg and Smoky Rivers. The order-in-council withdrawing mining rights states that a very large and valuable deposit of high grade coal on Dominion lands has been reported in the district, seventy miles from railway communication.

NOVA SCOTIA NOTES.

Nova Scotia Steel Co.

The officials of the Scotia Company anticipate that 1919 outputs will exceed those of 1918. The production of the collieries in 1918 was 502,018 tons, and indications now are that a total of 550,000 tons for the year may be reached for 1919. In this event, 1919 will show the highest production since 1914.

Dominion Coal Company.

It is announced that the Dominion Coal Company is proceeding further with the electrification of its collieries, a policy which was adopted about 1905. The application of the exhaust-steam turbine to electrical generation at the individual collieries is finding a wide application, installations of this kind being already in place at No. 2 Colliery, No. 1 Colliery, and in contemplation at No. 6 Colliery. The experience with an exhaust-steam turbine has been particularly good at No. 2 Colliery, where a Daniel Adamson turbine, driving a Brown-Boveri generator was installed about 1910 and has run steadily and satisfactorily ever since. The Dominion Company's experience with electric drive has been encouraging, and it includes application to underground pumping, colliery screening plants, ventilating fans, direct and auxiliary underground haulages, and hoisting engines for slope haulages. The greatest development of electrical power lies in the future in the winning of the undersea coal seams. The possibilities of the application of electric power to this problem are wide, and fascinating, and in Nova Scotia it will always be necessary to remember, in framing regulations for the governance of the use of electricity underground, that electricity, in the light of present knowledge, is the only motive power that will enable these vast submarine coal deposits to be won.

MANITOBA NOTES.

Mr. J. B. Tyrell has been retained to make an examination of the Gabrielle Mine in the Manigotagon. He will also report on the Gold Pan property.

A very general revival of interest in mining is reported in Manitoba, and Messrs. Milton Hersey & Co., through their Winnipeg office, report a great increase in the number of mineral samples submitted for examination.

The "Free Press" of Winnipeg states that the Beaver Lake, Saskatchewan, an older camp than either Flinflon or Mandy, is again coming to the fore. Messrs. G. A. Pow, Alexander Boyd and J. C. Collette have returned from a visit to a group of claims which Mr. Pow has held since 1915. The veins are enormous, but extremely low in grade, so that gold mining, though it may eventually be successful, will only be so if conducted on a large scale.

But Mr. Pow is showing some more interesting graphitic schist, samples of which, according to an analysis by Milton Hersey, run 8.17 per cent carbon and 0.28 per cent iron. This is a huge deposit. Where the body was trenched it measured 195 feet from wall to wall. Samples are being sent to Dixon and Co., of Newark, N.J., as well as to the Department of Mines, Ottawa to be reported upon.

DEVELOPMENT IN RICE LAKE GOLD AREA, NORTHERN MANITOBA.

Recent developments in the Rice Lake gold fields are being followed in a great deal of interest by those who claim that Manitoba has not yet awakened to her possibilities as a province very rich in gold deposits.

It is not generally known, but it is stated as a fact, that engineers representing an enormous amount of outside capital will, this winter, undertake very searching enquiries into the Rice Lake district. In the vicinity of Big Rice Lake it has been known ever since the Gabrielle was located that deposits of silver and copper exist as well as gold. This fact was known by the Gabrielle people back in 1912, and they hope to bring back to light several features by next summer which will amply prove the fact that Manitoba has not yet realized what her real wealth in mineral deposits is going to be.

As many already know the Gabrielle properties have been very exhaustively explored as far as the initial stage and they are now well advanced to the stage where further development is warranted on a much larger scale, and with more improved machinery. It is understood that their future plans of development work will be under the direct supervision of the best quartz mining engineer obtainable, and this decision seems to be quite warranted after Mr. Tyrell's remarks concerning the nature of rock existing in some of the world's richest quartz mines and which the Gabrielle people claim exists on their properties as well as one or two other claims which have been prospected to any considerable depth.

To the Gabrielle mine, which is the pioneer prospect of the Rice Lake district, the province may yet owe a great deal for the tenacious way they have stuck to their convictions that not only they, but several others, have what may yet prove to be very wealthy properties and which may eventually mean a great deal, not only to Winnipeg, but the West generally. They do not lay claim to being the only prospect worthy of support by the people of Manitoba and the West, but they apparently quite firmly believe in a conservative and sound management with the eventual result that their original views on our wealth in the Rice Lake country and elsewhere will be amply confirmed, and that sanely conducted mining ventures will finally prove of enormous value to those whom it should —the shareholders.

LEFT OUT IN THE COLD; POOR LITTLE CINDERELLA!

Manitoba is the Cinderella of the Canadian sisterhood, so far as the Geological Survey is concerned. The survey seems to have a fixed idea that British Columbia is the land of promise, and to that favored province go geologists in gangs, while we get but a stray one. Of course, B.C. is attractive; the climate is in most parts delightful, the scenery grand in the extreme; possibly science there finds its surroundings more conducive to the correct attitude of mind for the unravelling of complicated stratigraphical problems. No doubt, no doubt. Yet poor old Manitoba is trying to tell the world that as regards mineral wealth she can do her bit, and more than her bit, is given a chance, and we should be so thankful if the powers that be would send us a nice big flock of experts next season. Please do!

In Ontario the Dominion and provincial authorities seem to take delight in duplicating one another's work. P. C. Hopkins examines Larder Lake for the Ontario Bureau of Mines; shortly after, Dr. H. C. Cooke hastens there to read its riddles for the Dominion survey. A. G. Burrows reports on the Matachewan area, for Toronto, and forthwith Ottawa sends Dr. Cook to investigate what is in the same map sheet. To those that have much shall be given.

As for B.C. she is the petted darling of the G.S., if not its first love, certainly its latest. Eight parties have been assigned to the province during the summer, and a ninth took over the Mayo country, Y.T. J. J. O'Neill has been in charge of the party studying Salmon Arm, Portland Canal; B. R. McKay has investigated the placers of Cariboo; L. Reinecke passed weeks estimating the value of the soda lake between Clinton and Quesnel; the Slocan attracted M. F. Bancroft; the wild west coast of Vancouver Island yielded a wealth of information to V. Dolmage; S. J. Schofield seems to have discovered a new mining property which the Review calls "Brittania," S. C. McCann accumulated material for a map of the Bridge River country; and, lastly, Charles Camsell, the O.C. of the brigade, paid particular attention to the Coquilla section.

What are our members at Ottawa doing? Are they asleep? We have known men who would have got up on their hind legs and roared long ago.—C.A.B., in the Manitoba Free Press.

MANITOBA PERSONALS.

Gordon McTavish has gone up to the Gold Pan with J. B. Tyrell, M.E. The property will be thoroughly sampled.

G. A. Pow of the Copper King group, has returned from a journey to Beaver Lake, Saskatchewan, where he is interested in the Little Nell and other gold quartz claims.

Major Wheeler, of the city, is back from a trip through western end of The Pas district and the extreme easterly part of that of Prince Albert. He is said to be astonished at what he saw.

Special Correspondence

BRITISH COLUMBIA.

Grand Forks B. C.

Silver-lead ore of good quality has been found on a number of properties situated on Lightning Peak and, as a result operators and prospectors are showing some concern over the solution of the transportation problem. This peak is at the watershed of Cherry and Fire Valley Creeks and the north fork of the Kettle River. Hitherto the Fire Valley route has been regarded as affording the best transportation. Now, however, it is advocated that the camp should be opened by way of the Kettle River and Franklin Camp, it being contended that the grade will be better although the distance is greater than it is via Fire Valley.

Slocan B. C.

The Silversmith Mine, formerly known as the Slocan Star, a property over which there has been considerable costly litigation, was the subject of a recent deal of some importance. J. M. Harris, of Sandon, gave an option to B. Cohen, of Spokane, on 250,000 shares of common stock for $60,000, retaining his preferred stock. This is 20 cents a share and would make the total valuation of the Silversmith about a million dollars. It is suggested that John White, of Spokane, is behind the purchase and that the stock will be listed in New York.

Rossland B. C.

There now is no doubt that the Consolidated Mining & Smelting Co. of Canada will build a concentrator at Rossland B. C., having a capacity of 1500 tons a day and costing in the neighborhood of $750,000, for the purpose of treating the milling ores of the Company's Rossland properties. Mr. S. G. Blaylock, general manager, conferred with the municipal authority of Rossland recently in regard to the obtaining of a water supply and it was arranged that the necessary steps would be taken immediately to compile data as to the cost of such alterations to the waterworks system as will permit the impounding at the present reservoir of 78,000,000 gallons of water. This means the construction of a dam and a flume and the Company has offered the city the use of its engineering staff to faciliate the preparations of this data. Mr. Blaylock has given his assurance that, in the event of the city having to issue debentures to take care of the expenditure, the company will expect to assist. He however, has made it clear that the company's plant shall not be subject to ordinary city taxation.

Trail B. C.

Not only is the Consolidated Mining & Smelting Co. extending the scope of its operations at Rossland B. C. but, if reports as yet unofficial are to be credited, it promises the installation of a concentrator of large capacity at Kimberley B. C., to treat the ores of the Sullivan Mines, and is considering a similar plant, of smaller size of course, at the Sunloch Copper Mine, situated on the West Coast of Vancouver Island. The latter would have a capacity of about 500 tons. In this connection it is interesting to note that the new mill of the Canada Copper Co., Allenby B. C., is expected to be ready to commence operations early in the new year, the plan being that its concentrates shall be shipped for smelting to the Trail Smelter of the Consolidated Company.

The Consolidated M. & S. Company has abandoned the Fitzsimmons Group at Alta Lake on the Pacific Great Eastern Ry. on which it took a bond for $200,000 in the fall of 1918, established a camp, and started work which was suspended for the winter. There was a question of reducing the purchase price this Spring. No arrangement could be reached satisfactory to both parties and the Company has withdrawn. The owners now are in negotiation with other operators.

Ore receipts in gross tons for the week from September 22nd to Sept. 30th, inclusive, at the Consolidated Mining and Smelting Company's smelter, Trail, were 5,199, making the total for the year up to the date indicated 258,323 tons. Again the Mandy Mine, Le Pas, Manitoba, was the largest independent contributor shipping 558 tons. The Quilp, Republic Wn., sent 487 tons; the Lone Pine, Republic, 104 tons; the Blue Bell, Riondel B. C., 156 tons; the Josie, Rossland, 116 tons; and the North Star, Kimberley, 98 tons. Of the Company's properties the Centre Star, Rossland, shipped 1884 tons and the Sullivan, Kimberley contributed 1377 tons of zinc ore.

An interesting circular was issued recently by the Consolidated Company to the lead ore shippers to the Trail Smelter. It reads as follows:

"There has been a desire expressed by some of our shippers for a settlement for lead on a more definite date than is possible with a continuance of the present pooling scheme.

"Stocks are still considerable but are more nearly approaching normal and now that we are no longer supplying munition orders the demand can be depended upon to be more uniform than in the past.

"We are still suffering severe competition from Mexican lead and have to meet such priees as are made by those selling this lead. The so-called Montreal price is merely the St. Louis price plus freight and duty. There is practically no lead saleable in Canada at this price under present conditions In addition to the Mexican competition for Canadian domestic business, considerable quantities have had to be exported at the open market price to reduce stocks and take care of current production. This was due to the light Canadian demand. In spite of these adverse features we have been ble to average in each month's sales considerably more than the New York price for lead. We are therefore changing our method of lead settlement commencing with shipments received here on October 1st, and are amending Schedule "C" as follows.

" ' All the provisions on page 2 respecting payments for lead are cancelled and the following substituted:

" ' Lead—The lead contents will be determined by the wet method of analysis, deducting one and one half units to arrive at the dry assay. Lead will be accounted for on the dry load assay to the extent shown by the above assay; provivded, however, that in no case will the deduction from the said dry lead assay be less than one unit. or twenty pound per dry ton of ore.

" ' The price for lead to be used in settlement will be our average sales price delivered at destinaion in Canada, for the second calendar month succeeding the date of sampling, or the A. S. & R. Co's New York average quotation for the said second calendar month, which-ever is the greater, less a deduction in either case of one and one-half cents per pound for refining and marketing.

" ' There will be deducted also from the settlement price. $2.30 per ton on sales at Toronto and common points, and $4.50 a ton on sales at Montreal and common points, and similar diffferentials to other points. This freight adjustment is to cover actual increases in freights; e.g., should sales in any month be 2,000 tons, and say 1200 tons for delivery at Toronto and 800 tons at Montreal, the freight adjustment would be three-fifths at $1.30 and two-fifths at $4.50, or $3.18 per tons of lead."

Paragraphs A, B, and C, on Page 4 under the heading "Settlement" are cancelled and the following substituted:

Settlement a,—Shortly after sampling, an advance payment of 90 per cent of the apparent value will be made. The prices used in estimating the apparent value will be the New York price for lead.

Settlement b,—Shortly after the close of the second calendar month after sampling. when the data is available. the final value wil be computed and any adjustment necessary will be made between the Smelter and the mine."

"You will note that the least you can get is the price the United States smelters decide upon, and we will use every effort to make it as much more as we can. This is, of course, in our interest as much as in yours, as we are producing the bulk of the lead.

" Settlements for monthly receipts prior to October will proceed under the pooling scheme until further liquidated."

Kimberley B. C.

No sign of a settlement of the strike of the metalliferous miners, employed in the Sullivan and North Star Mines, was apparent on Saturday, October 11th, last. The men are out for an increase of $1 per diem in their wages and the management of the Consolidated Mining & Smelting Co., the Company chiefly concerned, has refused to negotiate the issue until the men repudiate the One Big Union. The committee representing the strikers has said that the men are out as a body of employees having no affiliations with any estblished miners' organization. This, however, they were unable to put in writing and judging by the attitude of Mr. S. G. Blaylock, the Company's manager, the latter is preparing for a long drawn out fight.

The contention that the O. B. U. is behind the walkout appears to be confirmed by a report published in the "Federationalist", a labor paper published in Vancouver, of a convention of District No. 1, metalliferous miners of the O. B. U. held at Nelson on September 21 and 22. Here it is stated that the chairman. T. B. Roberts, despite the fight for jurisdiction put up by the International Union of Mill, Mine and Smelter Workers, the O. B. U. had made esplendid progress, all the local unions, with the exception of that of the City of Sandon, being in the fold.

The statement continues:

"The camps at Trail and Rossland hal been granted 50c. per day increase owing to activity of the O. B. U. Kimberley unit had put in a demand for $1 per day increase, and having been turned down, had struck. This action was deplored by the executive committee who wanted the local units to live up to the demands of the general constitution. In this respect the demands should have been presented to the district executive board, and the chairman stated that if the units persisted in taking hasty action. the ultimate result would be the crippling of the organization.

"The executive recommended an active campaign against unsanitary camp conditions, and the Convention concurred in the report and recommended that pressure be brought to bear on all candidates seeking election to Provincial and Federal parliaments to have this remedied.

"The Convention decided to put a referendum of the membership in the employ of the Consolidated Mining & Smelting Co. the question of demanding $1 per day increase or a strike to enforce the demand."

The West Kootenay Power and Light Company will build a high power line from Bonnington, near Nelson B. C., to Kimberley, a distance of 100 miles. It will also built a line to the Rock Candy Mine of the Consolidated Company.

Riondel B. C.

A new strike of silver-lead-zinc ore has been made close to the old Blue Bell, Riondel. The vein is of fissure variety, cutting across the country formation of bedded schists and granite intrusions and has been traced for three-quarters of a mile. The ground has been staked and re-staked in the past because of its proximity to the oldest metalliferous mine in the Province but has never before been developed to any extent. It is the intention of the discoverers, R. D. Hearn and D. L. Eastman, to continue their open cut for a short distance, which has gone through eight feet of ore and still is in it, after which work will be continued on a tunnel nearby with the aid of a gasoline power drilling outfit.

Nelson B. C.

Exceedingly favorable reports have been received concerning the Iva Fern Property, situated on Cultus Creek, which is being developed by the Consolidated Mining & Smelting Co. It is stated that No. 2 Vein is known to extend over five miles, that it is more than 50 feet wide in places, and carries good percentages of gold, silver, lead and copper. J. Riley, a well-known prospector who is working a group of claims across the Creek from the Iva-Fern, states that all the development on the chief veins of the latter has been by open cuts and that there are large showings of good ore. J. W. Mulholland, the manager, is now driving a crosscut, designed to give a depth of some two hundred feet on No. 2 Vein, as well as to cut all the leading veins. Up to the present there are no facilities for the shipment of ore outside of a pack trail.

His Royal Highness, the Prince of Wales, in the course of his recent tour of British Columbia, made short stays at Nelson and other mining centres of the interior. For his benefit Fred A. Starkey, commissioner for the Associated Boards of Trade of Eastern B. C., E. W. Widowson, J. J. Currie, and other mining men and members of the Board of Trade, had placed on board the boat which took the Prince from Nelson to Balfour, (a soldiers' convalescent home on Kooteney Lake) a collection of specimens of the ores of the Kootenay—Boundary Districts. H. R. H. was much interested and listened with close attention to those who expounded the mineral resources of the Eastern sections of the Province, pointing their observations with the samples shown. Among the properties represented were: Standard Silver Lead, Index, McPhail's copper, Nickel Plate, Perrier, Bayonne, Kootenay, Gold, Gold Plate, Columbia Copper Gold, Sirdar, Lockhart, Le Roi, Bond Holder, Freddie Lee, Carpenter King, Meteor, Lightning Peak, Silver Cliff, Kootenay Belle, California, Black Prince, Hudson's Bay.

Some curiosity is shown with mining men with reference to some strips of crystallized nickel-sulphate, which were a part of the exhibit of ores and smelter products of the Consolidated Mining & Smelting Co. shown at the recent Vancouver B. C. Exhibition. One of these has been presented to a Nelson mining man. The crystals, of a greenish cast, are formed upon a lead strip which was hung in the solution from which they were deposited. Although the Company has not yet disposed of any of this nickel commercially it has accumulated a considerable quantity of it and it is stated that this by-product is being formed all the time. This is taken as establishing that notwithstanding statements to the contrary nickel does exist, in small quantities at least, in the rocks of the eastern part of British Columbia.

In the course of a tour through the mining sections of the Kootenay and Boundary Districts of the Province Hon. Wm. Sloan, Minister of Mines, met members of the Board of Trade of Nelson on Monday evening, the 6th inst., when the question of the French Complex Ore Reduction Co. and of the Ore Testing Plant,

which the Dominion Government proposes establishing in British Columbia, were discussed. In regard to the French Reduction Company it was stated by Mr. Sloan that, the process of treating the complex silver-lead-zinc ores of the Kootenays by the electrolytical process having been successfully demonstrated, the government's object in tendering the Company financial support was accomplished. The plant, it may be explained, now is idle and the government, by virtue of having guaranteed interest on bonds to the amount of $65,000, holds a mortgage covering all the Company's assets. As to the future of the property the Minister said that the government would have liked to see the plant utilized and made the basis of a big commercial enterprise. He thought that it ought to be possible to find some use for it and observed that, in this matter, the government would be guided by the opinions of the Board of Trade and the mining men of the district. He added that the shareholders in the Company, who had invested their money, had his sincere sympathy and it was agreed that they should have a clear month in which to make a start at re-organization. The Minister thought it might not be necessary to go through a foreclosure, or, if such a thing were deemed desirable, that it might be a friendly one, the Company assigning its assets to the government. J. O. Patenaude, speaking for the shareholders of Nelson, said that various mining men had made enquiries as to whether the plant would be available for treating their ores and it was possible that the Company might be able by putting an engineer in charge with the necessary training, to establish a commercial enterprise and at least recoup what had been lost. With reference to the Dominion Government's Ore Testing Plant, Mr. Sloan stated that Hon. Martin Burrell, Minister of Mines for the Dominion, had told him that the Plant would not go to the University of British Columbia at Vancouver. This being so it would not surprise him, he asserted, if it were to be won by the Interior. Answering Mr. F. A. Starkey, commissioner for the Eastern B. C. Boards of Trade, he said that the Provincial Government would be glad to permit the use of the present French Company Plant by the Dominion Government for an ore-testing installation in the event of the Company being unable to organize. Another subject discussed was that of having cabinets of minerals, particularly including specimens of those not familiar to mining men and prospectors of the district, displayed at different points for the instruction of all interested. Mr. Sloan thought it a good idea and said that already it had been adopted in a small way, all the mining engineers having such cabinets at their headquarters. He hoped to extend this to the offices of gold commissioners and mining recorders. The Minister also stated that the matter of supplying prospectors with powder at cost, by means of the same arrangement as that under which the farmers get explosives for clearing the land, was under consideration.

Victoria B. C.

The announcement of the awarding of a contract by the Canadian Pacific Ry. Co. for the extension of its Vancouver Island Ry., the E. & N. from Alberni to Great Central Lake has raised the hopes of mining men interested in the development of the mineral resources of the Island interior. There are a number of properties situated close to Great Central Lake of considerable promise. One of these is the Big Interior which, from engineer's report, consists of a large body of good ore, and the development of which has been much handicapped because of lack of transportation facilities. The proposed new line is 10½ miles in length and will not only open up a promising mineral zone but will tap virgin forests and open to the general public one of the finest sections, scenically, of western Canada.

Vancouver B. C.

Some information was given shareholders as to the development of the Nugget Gold Mining Property, Sheep Creek, at the annual meeting of the Company held recently at Vancouver. It was stated by President A. C. Burdick that the water problem for the Compressor had been solved by restoring the the North Fork Flume and that the Compressor would be operated hereafter full time instead of one shift a day. This would mean better progress in the driving of the crosscut now underway. This now was in 850 feet and would be carried on for the full distance of 1200 feet at the rate of eight and one half feet a day. The crosscut is being driven from the workings of the Motherlode, on the Sheep Creek side of the mountain, under the old Nugget workings on the Fawn Creek side at a depth 600 feet greater than was obtained by former development on the Nugget.

Wilmer B. C.

An option has been given on the Dolphine Silver Lead Property by Randolph E. Bruce, of Wilmer B. C., to delay. The property is situated on the Delphine Mountain, on the north fork of Toby Creek. There are various workings, the principal system consisting of a 30-foot shaft with a right drift 146 feet long, reaching the surface by an incline raise and a left drift 70 feet long, a shallow winze being sunk from this level and other drifts carried from the foot of the winze. The original ore body is stoped out but the formation is such as to promise ore bodies at no great distance. Ore shipped formerly ran about $100 a ton in silver and lead.

Portland Canal

Mr. George Clothier, Government Mining Engineer for the Northeast section of British Columbia, is completing his season in the field by a visit to the Marmot River District. This section has produced some rich silver-gold ore. The first shipments were from the two Marmot Properties—North Fork Basin, owned by William Fraser and Associates the Montana, owned by H. C. Magee and George Bruggie. Lack of transportation facilities made these shipments costly although the properties were only a short distance from tidewater. A number of new locations have been made along the Marmot during the summer and what development has been done has given satisfactory results. It is likely that Mr. Clothier will go into the Bear River section before returning to his headquarters at Prince Rupert.

The newly organized North Coast Branch of the Canadian Mining Institute held a meeting recently at Stewart B. C. with Major Angus Davis, general manager of the Dolly Varden Mine, as chairman and E. J. Conway, field engineer for the Granby Consolidated Mining & Smelting Co. as vice-chairman. Roy Clothier, of Stewart, acted as secretary.

E. E. Campbell, mine manager at Anyox for the Granby Company, in the course of an address, referred to the re-awakening of interest in the Portland Canal District said that he looked to Stewart and the adjacent mineral zone to develop into a really exceptional camp. While it was not generally known, the Granby Hidden Creek Mine was the biggest copper mine in the British Empire. The Dolly Varden, at Alice Arm, was a fine property in a splendid section and he looked for big things there. "I am not given to making prophecies" Mr. Campbell continued "but I prophesy that Stewart will become the chief mining centre in northern B. C. I travelled all over the northwest from Washington to Alaska when I was in the field for the Granby and I never saw a district with the possibilities that this has." Speaking of the aims and objects of the Institute and of work which it might undertake Mr. Campbell mentioned the matter of the removal, or at least the lowering of, the tariff on mining machinery. This duty was one of the chief obstacles to development, especially in the initial stages, the time when mining property required every encouragement.

Barkerville B. C.

Placer gold production in the Cariboo District this season has been considerably in excess of that of last and with development promised on Proserpine Quartz claim, which recently was acquired by eastern Canadian interests, considerable mining activity is assured next year. With reference to the quartz properties, R. A. Bryce who is in charge of the work of opening them up, states that about forty men will be employed during the winter. Word also comes from Stanley that what is described as an important gold strike was made by the Lightning Creek Hydraulic Limited where they are operating above the mouth of Amador Creek. The discovery was made by sinking a shaft about five hundred feet ahead of the face. Here they struck a channel apparently overlooked by the old timers. Manager L. A. Bonner states that the gold is heavy lead-gold and typical of the channel gold of this section. Although the season is well on he expects to make a substantial recovery before operations cease.

Grand Forks B. C.

The four units of the decrepitating plant of the Rock Candy Mill Mine which is ituated some 20 miles from Grand Forks, have been installed and, A. R. Robertson, the superintendent, states, are giving entire satisfaction in operation. The Mill is working to capacity, ore, which is transported to the Mill from the mine by means of an aerial tramway, being handled at the rate of 100 tons daily. For the most part the flourspar is being shipped to chemical plants of the State of Indiana and other of the United States, although, of course, sufficient is diverted for the use of the Consolidated Mining & Smelting Co's Smelter, Trail B. C., this Company being the owner of the Rock Candy. A bunker of considerable capacity has been placed at the Mill from which the concentrates are loaded on cars for shipment and it is expected that the output henceforth will average eighteen cars a week.

Camborne B. C.

Development is to be continued on the Beatrice Mine and other properties of the New Era Mining Company throughout the winter. W. E. Morphy, managing director of the Company, has laid in the supplies necessary to maintain the camp for the next six months and states that preparations are being made for much more extensive operations in the Spring.

Mr. Yip, Mining Engineer, a Chinese graduate of Camborne Eng., has been visiting the mines at Camborne. He has been engaged in a personal investigation of mining operations in the district with a view to the obtaining of practical knowledge that may be turned to account in the development of important mining leases held by his father in China.

Nelson B. C.

Hon. Wm. Sloan, Minister of Mines, visited the Slocan District in the course of a tour he has been making of the Eastern Mining Districts of the Province. He inspected a number of the well-known silver-lead properties of the district, among which was the Silversmith, formerly known as the Slocan Star. Entering on the tenth level, where a good ore shoot was opened up last year, he explored the workings up to the eighth level. Mr. Sloan reports that the new concentrating plant, installed at Alamo by Clarence Cunningham is working well. Good process also is being made on the 200 ton concentrating plant at the Noble Five Mine, it being similar in type to that at Alama. On the Standard, formerly the banner producer of the district, new areas of promise are being developed. The McAllister, Surprise and Ivanhoe are other prospects mentioned by the Minister as being promising. Mr. Sloan stated that he always had been an optimist where the Slocan was concerned and now was more than ever convinced that his faith was justified. Mine operators took advantage of his presence to represent the desirability of the construction of a road connecting the communities of New Denver and Sandon and also of providing means of transportation by wagon road with Nelson by way of Slocan City. Mr. Sloan expressed his appreciation of the benefit these works would be to the mining industry and promised to do all he could to assist in securing the necessary appropriations.

The Evening Star Property, Dayton Creek, near Slocan City, is being opened up with satisfactory results according to William Moore, the Manager. The mine buildings are completed and winter suplies are now being transported to the mine, which is situated at an altitude of 5,000 feet. In the workings the tunnel found the ledge, which now is being followed in the direction that eventually will bring the tunnel under the shaft. A granite dyke 20 feet in width, materially cut down the rate of progress in the drift but the face is again in the vein and two shifts of hand drillers are making good progress. It was Mr. Moore's intention to re-open the Silver Nugget, an adjacent property, this year but it has been decided to defer this work to next season.

That immediate action should be taken by the Dominion Government towards the establishment in the Province of an Ore Testing Plant is the strong and unanimous opinion of members of the Nelson Board of Trade, as well of the mine operators generally throughout the Kooteney and Boundary Districts. The Government has already provided the finances for the enterprise but as yet has taken no steps to construct necessary buildings and install the plant. There has been some discussion as to the most suitable site but it is thought that Nelson, now that it does not seem likely to go to the B. C. University, Vancouver, will

be chosen. Arguments for the proposed testing plant are well set out in a telegram forwarded by the Nelson Board of Trade to the Ottawa authorities which, in part, reads as follows:

"It is imperative that the Government should take up the question of the treatment of complex ores. Hon. Mr. Sloan, Provincial Minister of Mines, in discussing the matter, referred to the instance of the Consolidated Company of Trail, who have for years been experimenting with the ore from their Sullivan mine, spending several thousand dollars in the work and who now have made a complete commercial success of the treatment of these ores. It also was shown that such properties as the Slocan Star, the Cork-Province, the Rosebury-Surprise, and the Noble Five are now in a position to treat their ores to the best advantage, but only after constant, tedious and expensive research and experiment.

" It is self-evident that while wealthy corporations such as those mentioned can afford to undertake the risk of making large expenditures in that direction it is quite beyond the means of smaller concerns and individual owners to do so. It may be well to state here that the aggregate of the holdings of that class of owners covers by far the larger part of mining properties of the Province, which could be made productive on a paying basis.

"Therefore the meeting, after listening to the possibilities of the mining industry from competent authorities was unanimous in claiming that it was the duty of the Government to provide a suitable Plant, which will give the smaller concerns the necessary facilities for ascertaining the proper and most economical treatment for their complex ores."

Among other improvements decided upon by the Nugget Mines Ltd. in connection with the development of their properties at Sheep Creek is the re-building of the broken portion of the pipe-line from the north fork of Sheep Creek, only the line from the south fork having been in use since the new Company took over the Nugget and the Motherlode mines. This condition led to a water shortage at the Motherlode Compressor during the recent dry season which it is not intended shall be experienced again.

At the annual meeting of the Eureka Copper Mines Ltd., held recently at Nelson, officers were elected as follows: President, J. J. Malone; secretary-treasurer, J. G. Bunyan; directors, J. A. Gibson, L. K. Larsen, and J. G. Bunyan, of Nelson, and S. G. Campbell, of Vancouver. The property of the Company, the Eureka Gold Mine, Eagle Creek, is under lease and bond to the Inland Mining Company, of Walla Walla Wn., which has grouped it with the Granite-Poorman Property, the mill of which is crushing Eureka ore.

In this connection it is interesting to note that the Granite-Poorman Mill is to have its capacity increased from 50 to 150 tons, that the right-of-way now is being cleared on the line recently surveyed for the new 6000-foot link of aerial tramway from the Eureka workings to the upper terminal of the Granite-Poorman tram, and that the offices of the Vincent Development Company, which is developing and operating the properties for the Inland Mining Co., are to be moved from Walla Walla to Nelson. The Mill, which has been operating for months on ore taken from No. 2 or the main working level of the Eureka, is to be closed down in order to undergo a thorough overhauling and also to permit the extension proposed. The existing Granite-Poorman tramways also is to be put in shape, so that it will be ready to operate in conjunction with the Eureka section when the latter is completed.

A development of the last two months is the opening up of a new ore body on the main working level, which has been explored by drifting a distance of 150 feet, with the face still in ore. The closing of the Mill will not interfere with the continuance of development on this new ore body nor the work of the crosscut on No. 4 level, which is now in 500 feet.

Trail B. C.

Much interest has been aroused among British Columbia mining men by a statement made in London England recently by J. J. Warren, president of the Consolidated Mining & Smelting Co. of Canada. Mr. Warren is engaged in negotiating the sale of the company's zinc output. He said that the market possibilities for the company's product in Europe, South Africa and India are unlimited as regards the disposal of zinc. Canada can supply 10 per cent of the world's demand, equal to 780,000 tons of zinc, and is only producing 25,000 tons. Mr. Warren further stated that the impression he has gained is that the condition of the market warrants expansion to supply these 780,000 tons and he foresees no difficulty in arranging for increasing smelting facilities.

This statement, taken with the recent pronounced activity of the Consolidated Mining & Smelting Co. in British Columbia, is regarded as significant. For instance there is the report, as yet unconfirmed officially but believed to be authentic, that the Company proposes to install a large concentrating plant at Kimberley for the purpose of treating the ores of the Sullivan Mines, which are the largest producers of zinc ore in this Province and which possess almost unlimited reserves of such ore. It is the opinion of competent mining men that if the Company decided to work these mines on a big scale, and encouraged considerable increases in production on the part of independent owners of silver-lead-zinc properties, the production of British Columbia could be brought to the point indicated. In considering this matter it should be borne in mind that the Company's metallurgists at Trail B. C. have solved, according to official announcement, the problem of economically treating the complex ores of the Kootenay Districts.

Ore receipt in gross tons for the week from October 1 to the 7th inclusive at the Trail Smelter of the Consolidated Company aggregated 4,072, making a total for the year of 262,395 tons. The largest independent shipper was the Josie Mine, Rossland, with 502 tons. Next came the Mandy, of Le Pas Manitoba, with 468 tons. Other considerable contributors were the North Star, Kimberley, with 404 tons; the Black Bear, Rossland, with 231 tons; the Blue Bell, Riondell, with 183 tons; the Lone Pine, Republic Wn., with 114 fons; and the Highland, Cedar Creek, with 104 tons. The effect of the strike of miners at the Sullivan Mine, Kimberley, owned by the Company, is clearly evident, shipments having dropped to 62 tons, so that the only Company mine shipping in quantity is the Centre Star, of Rossland, which shipped 1400 tons of ore.

Prince Rupert B. C.

V. H. Todd, one of the engineer's staff with the Granby Consolidated Mining & Smelting Company, has returned to the coast after spending the season in charge of diamond drilling operations on properties in which the Company is interested on the Ecstall River, about 30 miles south of Port Essington B. C. Mr. Todd says that there are a number of men employed there at present but that the work will be closed down shortly for the winter. There are a number of promising prospects on the Ecstall and it is likely that the Company will start operations on a large scale next year.

Atlin B. C.

The gold output of the Atlin (B. C.) District for the season of 1919 is placed at $250,000, a considerable decrease in comparison with the usual production of approximately $400,000. Lack of men is given as the reason for this falling off by Frank Mobley M. P. P., who returned recently from Atlin, and who is the owner of the Discovery Mining and Power Company. He stated that the output of this Company will total $25,000. It is situated on Pine Creek and has been in operation all summer. Mr. Mobley does not expect that the profits will be great because of the increased costs of labor, equipment etc. He further asserts that only about 150 placer miners have been at work in the district this season, most of whom were engaged on Spruce Creek.

With reference to the Engineer Mine, one of the best known and probably the richest lode property of the Province, Mr. Mobley explains that, owing to the drowning of its owner Capt. Alexander and his wife when the Star "Princess Sophia" was wrecked last year and to the subsequent death of his heir at Pittsburg, no work has been done this year.

Dawson Y. T.

Navigation on the Yukon River was closed on the 8th of October. The movement of Yukoners to the Coast for the winter was not as great as usual, owing chiefly to reports of unrest on the outside and to the fact that silver mining prospects are very bright in Mayo, Twelve Mile and Fairbanks camps, where many will be engaged . The usual winter gold mining also requires many men.

Robert Leeson, a sourdough of the Klondyke, has left Dawson for Ulster, Ireland, to claim the title and estate of the Earl of Milltown, which is reported to carry with it an ancient castle and many valuable properties. Leeson is a member of the Yukon Order of Pioneer. He has been engaged for years in placer work in the Yukon and all this summer wielded a 20 pound sledge in the Guggenheim mines. No big strike came the way of Leeson who left to claim his heritage clad in a brown woollen shirt, hobnailed boots, and with his baggage slung over his shoulder.

Nome, Alaska

Prospectors recently returned to Nome report an interesting discovery near the head of Norton Sound of a large deposit of red ochre, valuable for its paint making properties. Natives say that their people have used as material for coloring purposes for generations. The same prospectors also found a vein of hematite seven miles from Norton Bay Mission. A tunnel some fifty feet deep, penetrating into the cliff side, and exposing at its extreme depth a ledge of ore about 10 feet wide, was disclosed by the clearing away of debris at the entrance. The theory is that this property was the scene of ancient mining operations, although none of the natives seemed to know anything of such work there during their lives nor to have any knowledge of any legend relating to the same.

Salmon River B. C.

In the Salmon River District, Portland Canal, Northern British Columbia preparations already are being made for winter by the various mining companies. It may seem early for this but the snow comes early and stays late in the hills of this region. While it is impossible as yet to say just how many men will be employed in the various camps throughout the winter it is certain that there will be a substantial payroll and that the centres of Stewart and Hyder will continue to be quite bustling and active throughout the closed season.

Among the companies which will continue to operate are the Premier, Bush, Big Missouri, Forty Nine, Mineral Hill and the New Alaska, the latter being on the Alaska side of the boundary line. These all are in the Salmon River section. On Bear Creek it is expected that the Lakeview, recently bonded by P. Welch and associates, and possibly the George Copper Properties, will maintain operations. While all these properties are reported to be in such shape that work can be continued through a hard winter the mainstay will be the Premier on which a considerable force will be employed. During the summer the efforts of the Premier Company have been devoted to a large extent to road building, and this necessity to ready transportation will be completed soon. On the Big Missouri diamond drill operations thus far are said to have been highly satisfactory. A similar report comes from the Forty Nine Property on which drilling is in progress. It is said in regard to the latter, that the short tunnel which was driven to intersect the vein encountered high grade ore which is being drifted on.

Generally those interested in Salmon River Properties are satisfied with the season's work. The development on many properties has been almost all that was hoped for—it would be difficult to get results that would be 'all that was hoped for'—and mine operators and prospectors are looking forward to next summer.

With reference to the Lakeview it is announced that work again has started on this group of claims. Spokane interest had the property optioned but let the property go after a little work. P. Welch and H. J. Fetter then took up the bond and development will proceed under the direction of Al. Harris, superintendent of the Mineral Hill. The Lakeview is situated on the north fork of Glacier Creek, about two and a half miles from Bear River. At the outcrop the vein is nine and a half feet wide. It is considered a promising property.

It would appear from the reports of prospectors who have been engaged on the Naas River side of the slope, as well as from samples with which they have returned, that the Salmon River formations and character of ore extends further than was originally figured. The Spider prospect, which is said to be very promising, is in this area. Besides miners have brought specimens from claims staked nearby which are shot with native silver. Some high grade ore also have been brought from the late discoveries across the glacier from the Big Missouri. There are a number of locations there and on property known as the Motherlode Group a wide vein of this ore has been uncovered. George Clothier, government engineer, intends visiting this ground before returning south.

Slocan B. C.

The concentrating mill in connection with the Noble Five Mine at Cody B. C. is in shape for the installation of the machinery. When completed it is expected to be the most complete mill in the Province.

THE COLLIERIES.

Returns of the production of a number of the Vancouver Island Collieries for the month of September follow:

No. 1 Mine, Canadian Western Fuel Co.	27,340
Harewood Colliery, "	19,302
Reserve Colliery, "	5,453
Modern Colliery, Pacific Coast Coal Mines	5,501
Jingle Pot Colliery, B. C. Coal Mines Co. Ltd.	3,344
Grant Colliery, Nanoose Coal Mining Co Ltd.	2,306

From the above figures it will be seen that the Reserve Mine, of the Canadian Western Fuel Co., although re-opened, is not yet up to normal in its output.

The coal mines of the Crow's Nest Field, Eastern British Columbia, are gradually being brought back to normal in point of production, although it need scarcely be said that it takes time to recover lost ground after a strike such as that through which the district has passed. The output now is about 80 per cent of what it was and an improvement is being shown each month. The coke ovens at Fernie are idle and it is thought likely they will remain so for some time. Those of Michel B. C. are operating only on a limited scale, the demand for the product being comparatively light at present.

The collieries of Vancouver Island are working steadily, there being no signs at the moment of anything but the best of feeling between the employed and the employer. Generally speaking the miners are working on the understanding that, with further increases in the cost of living, their wages advance. This applies to most with the exception of the Canadian Western Fuel Co., and the relationship between the latter and its men, as a result of the recent adjustment of the wage question, is of the best. The product, for the most part, is being used to care for the domestic demand which now is heavy because of the approach of the winter. From North Vancouver and other district comes the report that difficulty is being experienced in obtaining sufficient to take care of current orders. For this reason there is a belief that a shortage of coal may be experienced before the spring. This, however, is speculation. Responsible opinion appears to be that the collieries can be depended upon to take care of the local situation and, in any event, there is no serious shortage as yet.

At the annual meeting of the Mine Rescue and Ambulance Association of the Canadian Western Fuel Co., which was held recently at Nanaimo, J. Thompson was elected president; E. V. Paterson, secretary-treasurer, with J. W. Jensen as assistant; and to the Executive Committee, in addition to the chairman of the various committees, were appointed W. H. Moore, George Yarrow and George Moore. A feature of the proceedings was the presentation of $100 to the winners of competitions at the Labor Day Meet in Nanaimo under the auspices of the Mine Safety Assiciation of Vancouver Island. Mr. Moore explained these prizes were not in the nature of payment but were provided by the Company in recognition of the hard work to which the men had been subjected in preparation. The recipients were members of teams captained by J. W. Jensen, George Carson, J. Barton, J. Brown, A. McNill, R. Channock, J. McCourt, and M. Guinniss. It was decided that a paper on first-aid work would be delivered monthly before the members of the Association. This is only one of the arrangements made to sustain interest during the ensuing few months and to promote the object of the Association, namely, the equipping of every miner for practical help in case of need.

The Coalmont Coal Mining Co. is producing about 150 tons a day. The coal is shipped to the Kettle Valley Ry. by truck. Negotiations are in progress for the construction of a railway spur to the property which has turned out well under development.

The recent ligitation with reference to the title to coal rights within the foreshore lands of the Eastern Coast of Vancouver Island, which now is declared to lie with the Province, and the report that steps may be expected towards the opening up of the coal deposits of Suquash and vicinity on an extensive scale, have made the reports of Dr. Charles H. Clapp and Dr. B. D. Dowling, the two principal geologists to investigate this area, of special interest. Dr. Clapp in his report on the industry in Memoir 51 of the Geological Survey Series, says:

"The future of the coal industry is very promising, although thinner and deeper coals will have to be mined in the near future. As already stated, two new shaft mines have reached the Douglas seam in area of 181 square miles."

In his estimate of coal resources Dr. Clapp places the production at 24,500,000 tons up to 1912 and it recently estimated that the figure now would stand at about 30,000,000 tons. Dr. Dowling places the probable resources of the Nanaimo field at 1,340,000,000 tons.

The coal occurs chiefly in the lower part of the Nanaimo series in three seams, the Wellington, the Newcastle and the Douglas. The lowest seam, the Wellington, lies at the base of the Extension formation and rests on the East Wellington sandstone, and is about 700 feet above the base of the Nanaimo series. The Newcastle seam occurs at the base of the Newcastle formation, and overlies the Wellington seam by about 800 to 1,000 feet. The Douglas seam is contained in the Newcastle formation and from 25 to 100 feet above the Newcastle seam.

The coals of the various mines are as a whole much alike, and are high volatile bituminous coals of fair quality. The amount of fixed carbon in the best quality ranges from 45 to 60 per cent and the ash from 5 to 10 per cent. The coal, especially that from the Wellington seam, coke readily.

The aerial tramway from the Sovereign Mine to Sandon is in operation, having been completed about two weeks ago. The designing and building was carried out under the direction of E. O. White. The length of the tram is 8000 feet, the longest span 1700 feet, and the highest tower 98 feet. It is one of the finest aerial tramways in the Slocan District and was commenced on May 8th last.

WANTED—Young man with mining or chemical engineering education, to take laboratory position with opportunity for advancement. Reply giving full particulars and references to care, Secretary, Canadian Mining Institute, 503 Drummond Bldg., Montreal.

The Board of Trade of the City of Prince Rupert is bringing to the attention of the Canadian Government the importance of the construction of a branch railway to connect the Grand Trunk Pacific Ry. with the Groundhog Mountain Coal Fields of British Columbia. A recent resolution asks that an investigation be made of the most feasible route for such a railway and gives many reasons why the authorities should interest themselves in the enterprise. Among the latter is that the Groundhog coal field, which lies undeveloped, "embraces an area of between forty and seventy square miles in which competent geologists report are situated extensive coal deposits, the quality of the coal varying from bituminous to a high class anthracite, not surpassed by the best Pennsylvania products." Also that within the same area are important metal mining possibilities at present dormant and that the question of fuel supplies under the protection of the British flag has an important bearing on our national life.

NORTHERN ONTARIO.

The Prince Visits Cobalt.

The Cobalt mining camp on October 16th extended a fitting welcome to His Royal Highness the Prince of Wales. Miners, prospectors, ladies, children, business men and northeners of many different tongues, races and creeds mingled in great masses on the principal streets and along the route of the Royal procession as it wended its way through the silver city and to the mines. Never before in the history of the North has such a scene been witnessed. Never in this country's past has the citizenry paid such tribute to even a Royal personage, and never has the people so long noted for their lack of impulse been seen to throw their traditional reserve aside and offer spontaneous welcome. It was a scene unprecedented in the North and a fitting tribute to their future King.

Following the addresses of welcome and the presenations the Royal party was conveyed in a long train of automobiles, first to theConiagas mine and had a brief view of the silver ore in process of milling. After this, the refinery of the Mining Corporation of Canada was visited. where His Royal Highness witnessed the molten silver being poured out into bars. The party next proceeded to the O'Brien Mine, by way of the McKinley-Darragh and Kerr Lake mines. At the O'Brien the Prince was taken into the mine and permitted to view in person the underground workings and see in actual application by which the silver mines of Cobalt have added more than three hundred million ounces of silver to the wealth of the British Empire.

THE GOLD MINES.

Hollinger Production.

When during the twelve weeks ended Sept. 9th, the Hollinger mine produced $1,673,220,12,, it showed an average of $557,740.40 every four weeks of which some $295,373.48 was net profit.

For the year to date, according to official figures the output has averaged $537,760.61 every four weeks. Taking the latter figures as a basis of calculation the output for the current year will approximate $7,000,000. The rate of gross production as shown in the last twelve weeks covered by the report just issued would approximate $7,246,287.10 a year.

During the year to date the mill of the Hollinger has been running at only 69 per cent. of possible running time due to the shortage of labor. As evidence of a higher rate of earnings, the company realized a net profit of $295,373.48 every four weeks during the twelve weeks ended Septmbr 9 as compared with an average of $267,320.82 every four since the beginning of the year. This would indicate a net profit of $3,475,170.66 for the whole of the current year, and by utilizing equipment at only a little over two-thirds capacity This is at the rate of about fourteen per cent. on the companies issued capital. From this must be deducted about $300,000 at the cost of expenditures for the plant, thus reducing net profit to about 12½ per cent.

It can therefore be seen that the predicted 1 per cent. dividend every four weeks instead of every eight weeks as at present will depend upon whether or not more men can be secured. In order to disburse 1 per cent. four-weekly, a net profit of $246,000 is necessary every twenty-eight days, after making due allowance for expenditure on plant as well as providing for depreciation of plant. Only a slight increase in output is all that is necessary to see this realized, and as the end of the year approaches interest is centering keenly on the outlook for a greater quantity of labor.

A group of claims owned formerly by the Boyce Syndicate in the Porcupine district, has been taken over by new interest and will be known as the Gold Centre Mines Ltd., with an authorized capial of 3,000,000 shares of the par value of $1 each.

The property consists of 160 acres and lies about one mile east from the productive area of the Hollinger Consolidated, and is in a section of the camp where only a limited amount of work has been so far undertaken. Statements eminating from Porcupine declare that the property adjoins the Hollinger. While this is true, it is mis-leading for the reason that the part of the Hollinger which the property adjoins is a fraction about one mile in length which stretches straight east from the main group of the Hollinger. This easterly strip of Hollinger territory has never been productive. The property is also situated about three-quarters of a mile from the productive area of the McIntyre-Porcupine.

The Gold Centre has the advantage of being situated on the railway, and also has the transmission line of the Northern Canada Power Company passing over it. Due to only a limited amount of work having been previously carried on in that section, its exploration would be important inasmuch as it would tend to indicate the possibilities of carrying on successful work on a number of other promising properties in that area.

THE SILVER MINES.

During the last six days in September the Nipissing mine produced an average of about $11,000 a day, or a total of $66,395, the mill having been opened on the 24th.

In his regular monthly report to the president and directors, H. Park, manager says.—The recent strike, called by the Western Federation of Miners on July 23rd, was called off on September 8th. Dewatering the several shafts was commenced immediately and by September 24th sufficient levels were accessable at the 73 shaft to start the low grade mill, which has been running at capacity ever since. General opera-

tions underground will gradually be increased to normal as lower levels become available.

During the month of September the company mined ore of an estimated vaue of $66,395 and shipped bullion and residue from Nipissing and custom ores of an estimated et value of $648,737. The lowgrade mill treated 1721 tons of low grade ore. The new high grade plant treated $130 tons. The refinery shipped 525,695 ounces of fine bullion.

The following is an estimate of production for the month of September:—

Low grade mill	$49,907
Washing Plant	616,488
Total	$66,395

During the month of September the Kerr Lake mine produced upwards of 60,000 ounces of silver. The strike was called off only on Sept. 7th, after which date it can be seen that production averaged not far under $3,000 every twenty-four hours, or an almost normal average. This represents one of the quickest recoveries from the effects of the strike some of the leading mines have occupied from one to three weeks to recover.

The foregoing achievement appears to indicate a probability of the current fiscal year being quite profitable for the Kerr Lake.

The Lake Shore Mine has already secured sufficient men with which to resume production at full blast. But for the necessity of installing a conveyor to transport ore from the surface dump to the mill pending the completion of the pumping out of the mine, production would have been reached a few days earlier.

No further labor difficulties are anticipated in that the men have broken away from the influence of the Western Federation of Miners' and have decided to cooperate with the company for the best interests of themselves and of the mining industry.

The correspondent of the "Journal" is officially informed that as the result of exploration work on the Gans lot of the Temiskaming mine, considerable success has been met with, some rich patches of ore being encountered.

In the South end of the Gans area, where a considerable amount of development work had been previously done without any successful results, the discovery of silver-bearing ore was made on April last, upon which efforts have since been concentrated in the endeavor to prove its extent and value.

The occurrence exists in the 506 vein where a small patch of ore was first found in a raise put up above the 500-ft. level. Three raises have since been driven to a height of 70 feet and at 35 feet above the 500-ft. level a sub drift has been extended for a length of 115 feet. The vein, which is showing for this length, averages 3 inches in width but is of very uncertain character, occasional rich patches of ore alternating with barren sections so that it has been impossible, so far, to make any definite statement with regard to its possibilities from a productive point of view.

The policy adopted by the company endeavoring to prove its prospective value before publishing information was done entirely in the interests of the shareholders, says an official, and results have shown that any premature anouncement of the discovery would have been advisable in view of the possible disappointment.

Further development work is being actively prosecuted by continuation of three raises at intervals covering a length on the vein of 220 feet, and the extension of the South drift at the 400-f. level to connect these.

While the work above described has been in progress, exploratory work in the older workings at the South end of the 575-ft. level, in the vicinity of the Keewatin-diabase contact has proved successful in locating a body of good grade milling ore. In addition, one or two small pillars of high grade ore have been extracted which have helped to maintain the output on a paying margin during development of the 506 vein in the Gans section.

COLLAPSE OF THE KIRKLAND LAKE STRIKE.

The decision to resume production at the Lake Shore and at the Teck-Hughes mines, at Kirkland Lake, marks the complete collapse of the labor strike which commenced there on June 12. The statement of D. L. H. Forbes, manager of the Teck-Hughes mine published in the "Journal" of last week makes the situation quite clear. In referring to the men now being engaged, and the efforts of the radicals to dissuade them from going to work, Mr. Forbes used this crisp phrase:—

"Our answer to this is that the men we are now engaging are the real employees who will have permanent employment in this district, and, the socialists, by their unfair tactics and greedy scheme to create a monopoly of labor here, have forfeited any right they may ever have had to be considered as our workmen."

Such appears to express the general sentiment of the mine operators in the Kirkland Lake field, and, indeed, represents the sentiment of a majority of the employees. For considerable time these men have expressed a desire to return to work but have been prevented from doing so by the radical minority.

In regard to the question of wages and hours, which already compare favorably with other gold mining camps in the Dominion, Mr. Forbes has this to say:—

"Any alterations and adjustment of the wage scale or working hours must come as a result of conference and cooperation by the Workmen actually in their (the companies) employ and not as a result of a strike precipitated by socialist agitators most of whom were merely parasites on the real workmen of the district."

In the light of the foregoing assertions, the labor strike in the Kirkland Lake field has been a success not alone for the mining companies, but equally so for the real workmen of the camp. By reason of the ridiculous situation created by the radicals the workmen have become freed from the insidious presence of the "red element" which has made Kirkland Lake its rendezvous for the past two or three years. The real workmen are now in a position to discuss questions with the mine managers and join whole heartedly in the general invitation to cooperate for the general good of the mining industry. This puts the companies in a position where they may lay their future plans with a knowledge that they will be dealing with intelligent men and not with desciples of Bolshevism and irresponsible persons.

It is interesting to note that, following the decision of the mines to resume work and break the strike, the union has decided to call off the strike.

ST. REMI KAOLIN DEPOSITS, AMHERST TOWNSHIP, QUE.

Memoir 113, just issued by the Department of Mines, describes the geology and mineral deposits of the southern part of Amherst Township, Labelle County, Quebec, with especial reference to the occurrence of kaolin near St. Remi. The Memoir is the work of M. E. Wilson of the Geological Survey.

The introduction to the Memoir states that although deposits of china clay are known to occur in numerous localities in Canada, they are of small extent and not of commercial importance. Furthermore, since kaolin commonly occurs in such relationships as to indicate that it has been formed as a product of surface weathering, and throughout a large part of Canada, the products resulting from such alterations have been, for the most part, removed by the erosive action of the continental glaciers, it is probable that deposits of kaolin, on the whole, are less abundant in Canada than in parts of the world where Pleistocene continental glaciation did not occur. The St. Remi occurrences are therefore of unusual importance to Canada.

A history of the development of the China clay deposits is given, which is as follows:

In the summer of 1894, Milion Thomas, while digging a well on the farm of Philibert Tasse, encountered kaolin at a depth of 15 feet and sent a small quantity of the material to Richard Lanigan of Calumet, who identified the sample as kaolin and purchased the right to mine the material from the owner of the property. No attempt was made to determine the extent of the deposits at that time, however, and it was not until 1911 that actual development work on the deposits was commenced.

In the autumn of 1909, Mr. F. R. Lanigan, of Montreal, acquired from the government the mining rights to parts of lots 4, 5, 6, 7 and 8, range VI, south, Amherst township, and in 1911, having leased these rights to Mr. J. C. Broderick of Montreal, formed the St. Remi Kaolin Company, to take over the ownership of the property. In 1911, some development work was performed and the construction of a washing plant begun by Mr. Broderick, and in 1912 the Canadian China Clay Company was organized to continue mining operations under the terms of Mr. Broderick's lease. In 1913 the Canadian China Clay Company purchased the mining rights to parts of lots 4 to 8, range VI, south, Amherst township, from the St. Remi Kaolin Company; the mining rights to parts of lots 2 and 3 and additional parts of lots 2 to 8, range VI, south, Amherst township, from the government; and the surface rights to all these lots, from the local owners. Since that time the washing plant on the property has been enlarged, some trenching, stripping, and drilling for the purpose of developing the deposits completed, and several thousand tons of kaolin produced. Prior to 1916 the washed product had to be transported by wagon to Huberdeau, the terminus of the Huberdeau branch of the Canadian Northern railway, but in that year the railway was extended to the china clay deposits so that the cost of transportation from the mine has been greatly reduced.

The only known deposit of kaolin in the district, outside the area owned by the Canadian China Clay Company, occurs near Pike creek, on lot 8, range 4, Amherst township, and is owned by Mr. A. Lanigan of Calumet. This deposit, which had been known to Mr. Lanigan for a number of years, was staked by him in December, 1911.

The St. Remi occurrence of kaolin is unusual in that it appears to have been deposited within a fracture zone, and the indications are that the mineral was not developed in place, but was carried into the fractured zone from an outside source. Since the deposit is largely hidden by the boulder clay the extent of the mineral present is not even approximately known, but the enormous size and abundance of the kaolin leads so far bare by trenching and stripping indicate "that there are good prospective possibilities for the discovery of enormous masses of the material.

In the St. Remie district there is also some graphite, associated with a ridge of Grenville limestone, but apparently the deposits are too irregular and discontinuous to be profitably mined.

The Memoir is accompanied by a number of good photographs, and two maps. The general geology of the district and the rock characteristics are exhaustively described.

HAIL HOOVER!

Old Abou Ben Adhem, in his "deep dream of peace"
Had nothing on Bert Hoover with his war bread recipes;
For Abou loved his fellow men, according to the scribe,
While Hoover loved and fed them too, of every race and tribe.

Through war's dread reign he garnered grain in all the seven seas;
To every famine-stricken land he sent his argosies.
That he's our leading dough-boy is clearly manifest;
In head-lines and in bread-lines "his name led all the rest."

Then cheer, cheer for Hoover, the mining engineer,
Philanthropist and statesman and matchless financier!
No chronicle of history a worthier feat narrates.
Thrice welcome, Herbert Hoover, home to United States!

Anon.

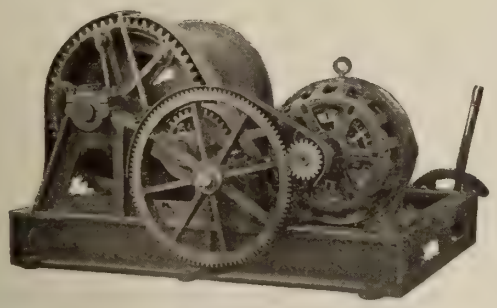
MINERAL OUTPUT OF THE U.K.

The statistics of the mines and quarries in Great Britain and Ireland during the year 1918 are dealt with in the report of the Chief Inspector of Mines, and issued as a White Paper by the Home Office.

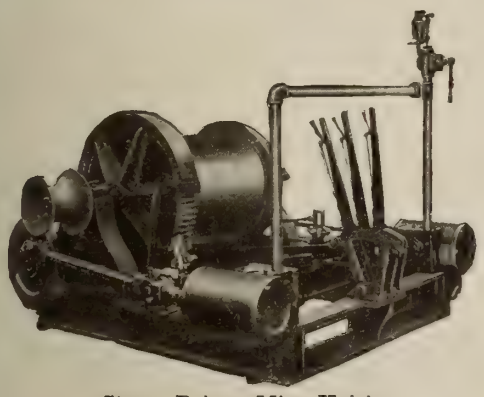
The principal outputs of minerals were: Coal, 227,748,654 tons, as against 248,499,240 tons in 1917; iron ore, 14,613,032 tons, as against 14,845,734 tons; and limestone, 10,156,603 tons, as against 10,454,717 tons. The grand total output of all minerals was 273,988,449½ tons, as compared with 295,401,139½ tons for 1917.

OBITUARY.

We regret to record the death at the age of 40 of Duncan McD. Campbell, B.A., B.Sc., a member of the Provincial Board of Nova Scotia, and formerly Engineer of the City of Sydney. Mr. Campbell, in his professional work as a civil engineer, has taken an important part in the civic engineering associated with and arising out of the industrial development of Sydney, Nova Scotia. He was highly regarded by brother engineers in Nova Scotia, and although of a retiring and studious nature, is widely regretted by all who had occasion, through personal acquaintance, to know how conscientiously he carried out his professional duties, and his sterling personal character.



Electrically Operated Mine Hoist.



Steam Driven Mine Hoist.

7 OF OUR MINE HOISTS IN USE BY ONE N.B. MINER 7

and this is not the only firm in Canada using seven of our Hoists.

Would these customers continue to purchase our Hoists from year to year as their business grows without a good reason?

Quality and service count for much more than price in the long run, and while we can assure you that the price of our Hoists is reasonable, the price alone would not have secured us these many repeat orders. These customers were satisfied with the quality of the Hoists, the honest workmanship and material put into the machines, the skill exercised in their design, and their comparative freedom from premature breakdowns or repairs.

Our Mine Hoists are built right, and give the best of service—that is why our customers stay with us, and continue to order more machines as their needs increase.

Choice of 7 sizes in either Electric or Steam Hoists, ranging from 10 H. P. to 50 H. P.

Now that you have tried Klim

You who took our free offer to try Klim, what do you think of it? What's your honest opinion of its fitness as THE milk supply of camps and boarding houses?

Isn't it the handiest, most compact and economical form of milk you ever met with? And its flavor—well, it couldn't help being good; there's nothing in Klim but all the solids of separated milk.

You can get good service on your Klim orders by sending them to your wholesale grocer.

If you didn't get that trial tin write to our nearest office.

LIMONITE DEPOSIT NEAR LILLOOET, B.C., FROM OUR B.C. CORRESPONDENT.

Large deposits of limonite iron ore, carrying high percentages of mineral with small percentages of impurities, and suitable in a superlative degree for fluxing with the known extensive magnetite iron deposits of the Province in the production of pig iron, were reported some months ago on the Taseko (Whitewater) River, Clinton Mining Division. The exact location, it was ascertained subsequently, is some miles from Lillooet, not many miles from the Pacific Great Eastern Railway.

In compliance with the application of the stakers, and acting under the authority of the Mineral Survey & Development Act, Hon. Wm. Sloan, Minister of Mines, instructed Wm. Brewer, one of the government mining engineers, to visit and submit a report on these properties. This he has done and his findings, while his conclusions are general and his estimates no more than approximations owing to the short time he was able to spend on the ground, are of so favorable a character that Mr. Sloan felt further investigation to be important. To this end, with the approval and the consent of Hon. Martin Burrell, Minister of Mines for the Dominion, the services of S. J. Schofield, senior geologist with the Geological Branch, Ottawa, were secured. Mr. Schofield and party, accordingly, have left for the Whitewater, the former's instructions being to make as thorough an examination of geological and local conditions and to prepare a report at as early a date as possible. As this report may have a considerable influence on any action that may be taken by Capital towards the establishment of an iron and steel industry in the Northwest it is satisfactory to know that Mr. Schofield is a geologist of the highest attainments, commanding the confidence of the mine operators of America. He surveyed the Cranbrook Map Area, has done other important work in British Columbia and in Canada, and was engaged in a geological survey of the Britannia Geological Field of the time he was requested to make the trip to the iron deposits in question.

Mr. Brewer, referring to the quantity of ore on the Whitewater, states that "the superficial area covered by the various exposed deposits examined—is roughly estimated at four hundred acres, but there is a possibility of this extent being much larger because in places there are indications of ore deposits at present covered by tallus, grassy hummocks or hidden by timber. In estimating tonnage of actual ore, meaning thereby such quantity as development has exposed as measurable and immediately available, the only method to adopt in the absence of development work, is to credit the various deposits with an estimated average thickness, judged from experience in mining similar deposits." He then proceeds to estimate, with the foregoing qualification, as follows:

Actual Ore—7,200,000 tons carrying above 40% metallic iron.

Probable Ore—15,000,000 tons carrying above 40% metallic iron.

Possible Ore—50,000,000 tons carrying above 40% metallic iron.

"No consideration," it is added" is given to samples of partly mineralized rock which assayed 20.2 and 16.4 per cent iron."

Discussing the quality of the ore, Mr. Brewer states that assays of samples taken during the examination show that the material classed as ore contains from 41 to 50 per cent metallic iron; that four out of nine of these samples contained only traces of phosphorus, one sample 0.04 per cent, and the remaining four 0.23 per cent, 0.21 per cent, 0.85 per cent and 0.52 per cent, respectively. These results place five of the samples within the Bessemer limit, with the remaining four above the Bessemer limit, but not in excess for the basic or open hearth process of making steel. "These results," he continues," show that the ore can be used either in a blast furnace as the entire charge of iron ore or will make a most desirable mixture for combination with the magnetite ore of the Province."

As to the cost of mining it is said that these deposits of limonite are so located and made up of such comparatively friable material that they can be mined with a steam shovel and the cost of the actual mining, it is figured, should not be above 25 cents a ton.

In reference to transportation it is pointed out that there are at present no transportation facilities nearer than Mission on the Pacific Great Eastern Ry., at least sixty miles distant from the occurrences of iron ore described. Therefore, before any statements can be made, relative to the future facilities, surveys are necessary to determine the most feasible route as well as the location of the manufacturing plant for treatment of the ore.

PORT ARTHUR DISTRICT VERY ACTIVE.

There are unmistakable symptoms of renewed mining activity in the mineral areas tributary to Port Arthur.

Iron and silver ores are the two most active factors in the revival. For the first time in twenty years this district will get credit for silver production, at least four mines will be operated continuously during the winter, and several others are being investigated.

Smith & Travers, of Sudbury, are diamond drilling the Leitch iron lands, and are meeting with extraordinary results. These lands are situated 130 miles east of Port Arthur, and about six miles north of the Canadian National Railway, at Beardmore station. Particulars of the results cannot be divulged at present. The drilling is being done for United States interest.

The Little Long Lake iron lands, principally owned by Capt. H. E. Knobel, J. W. Wolvin and John A. McKechnie, are on the same range as the Leitch lands. This tract has recently been examined by an Engineer of national reputation, who was greatly impressed by the length and breadth of the deposit, and the character of the ore showing on the surface. Diamond drilling has been recommended, with every certainty that large bodies of merchantable ore will be disclosed. The occurence of specular hematite, so intermixed with medium and high grade magnetite as to bring up the tenor very perceptably, makes this deposit very interesting.

Amongst the prominent Mining Engineers and Corporation representatives who have recently visited the Port Arthur area, are, Prof. H. E. T. Haultain, Toronto University, G. C. Bateman, La Rose Mining Co. Cobalt, W. L. Hughes, Mining Corporation, Cobalt, J. P Sparks, Temiskaming Mining Co. Cobalt, R. G. McConnell, Deputy Minister of Mines, Ottawa, M. Davis, The M. J. O'Brien Corporation, Ottawa, R. Y. Taylor-Blount, London, Eng., J. B. Tyrell M. E., The Anglo-French Corporation, London, Eng., C. W. Knight, Assistant Provincial Geologist, Toronto, Mr. Spence-Thomas, Cardiff, Wales, Mr. J. C. Murray M. E., and many others.

The Meeting of the Canadian Mining Institute in Vancouver November 26, 27, 28, 1919

A meeting of the Canadian Mining Institute will be held in Vancouver during the concluding days of November. Dr. E. T. Hodge, Professor of Geology at the University of British Columbia, has been appointed General Secretary of this meeting, and all the news that reaches us from British Columbia indicates that a meeting is being organized which will be worth while travelling to attend.

The mineral production of British Columbia has attained the greatest value in the history of that Province. It is the second province of Canada in monetary value of mineral output, and in variety of product it leads all the provinces.

Signs are increasing that the immediate future of the mineral industry in British Columbia is exceedingly bright. The two western provinces which will be most interested in the Vancouver meeting include that part of Canada which contains the bulk of Canada's basic coal asset. The tremendous coal reserve of British Columbia and Alberta has such far-reaching implications that we would not dare to attempt to sketch them even in roughest outline. The possession of coal connotes both industrial and political power. It assures the future. It provides the most stable foundation on which to rear a national industry, a national culture, and national independence, always provided the people who occupy the land are virile and upstanding, and no person has ever questioned this characteristic of our western people.

More definite announcements regarding this meeting will be found in succeeding issues of the 'Journal,' which, needless to say, extends its heartiest good wishes for a large and successful meeting.

The Princess Colliery Tunnel

Mr. James Purves describes in this issue an unusual and interesting connecting survey which was successfully carried out under his direction in the Princess Colliery of the Nova Scotia Steel & Coal Company at Sydney Mines. It was the difficult conditions under which the work was carried out that will interest the practical surveyor, prominent among which was the constant movement of the strata caused by "creep." The connecting tunnel was driven through the waste, or, to use the phraseology of the north-country miner in England, the "gob was scoured" for a distance of 8,000 feet, the roof and pavement and the partly consolidated fallen rock lying in between being in constant but irregular movement. Long sights were infrequent, and it is mentioned that in one case nine settings of the instrument were required for 88 feet of distance. The work was subject to interference by workmen employed on the tunnel excavation, and many other distractions were the lot of the survey parties.

As a record of an unusual and difficult piece of work well done we believe Mr. Purves's account will have a practical interest to many of the readers of the 'Journal,' and we may further state that it was only upon our strong representations that the account should be published for the information of other mining men, that we prevailed upon Mr. Purves to write the description.

The Princess Colliery is in many respects an interesting place. Commenced by the General Mining Association in 1868, it was called the "New Winning," a name that has become almost humorously incongruous today. Mr. R. H. Brown, formerly Manager for the G.M.A., is authority for the statement that in this colliery in 1876 the first undersea coal in North America was won.

The Colliery is unique in another respect, inasmuch as the "Princess Deeps" are now extended seawards approximately 2¼ miles, and will require to be extended for a distance of approximately 3½ miles from the shaft bottom before they emerge from the leased area of the Dominion Coal Company and gain the outlying areas of the Scotia Company. Thus, the Princess Colliery has the longest undersea extension in America, and its plans contemplate the furthest seaward extension of coal extraction yet arranged for on this side the Atlantic.

The necessity for accuracy in the connecting survey to ensure a straight haulage-road arose from the far-reaching plans for future undersea mining, and with this also in view the Princess deeps have been driven of unusual width, with a view to passing large volumes of air. Similarly adequate provision for rapid long-distance haulage of coal is being made. In very many respects the Princess Colliery has no counterpart.

Britain's Debts Will Be Paid

A despatch from Atlantic City reads that at the International Trade Conference, which commenced there on the 20th October, the delegates were surprised when Sir J. H. Simpson, representing Great Britain, said that his country did not ask financial aid from any organization, but merely wished that no obstruction should be placed in the way of ordinary business.

Why should such a statement excite surprise?

Sir James correctly stated that no Government could stand in England which would contemplate for a moment any weakening in regard to the payments of the country's debts. "England," said Sir James, "is determined to pay her debts. England has always paid her debts, and will."

Brave words, and best of all, true words. The statement has two implications. Britain pays up, and she will see that other people do the same. The discharge of obligations in business, as in war, is an ingrained British habit.

Sir James further asserted: "The future of England is not dark. It is as bright as could be hoped for after making allowances for the war." There is one debt that Britain cannot repay, the debt she owes to those who died for her, but all other obligations will be liquidated in due course. Those who carelessly think that because Britain lost one million men in war, and emerges from the war with seven billion pounds national debt, she will fail in any particular, are wholly mistaken. The generation of Britons now passing into manhood, in four quarters of the globe, have passed five of the most impressionable years of life amid such fires of patriotism as come to full glow only in times of dire national emergency such as these five years were. This fact should not be lost sight of. There never was such a generation of youth in British history as that which will soon shape our policies, and, if they are not worthy of their fathers and mothers, they will be the first recreant generation in British history. That Britain is entering new ground is not to be denied. Old things are passed away and many things are become new, but in everything that makes for national strength the British peoples were never so remarkable as they are today. Our great traditions have been worthily sustained and notably added to, our national word and integrity cannot be impugned, we have emerged victorious from a war of Titans, desperately waged; our women were worthy of their men. The commonwealth of sister nations that, for want of a better term, we call the British Empire, may be financially poorer, but it is richer in everything else that matters, and, after all, there is no more goading spur to a proud and independent people than debt.

Our Northern Ontario Letter

The 'Journal has arranged for a weekly letter from its Northern Ontario correspondent, in which it is hoped to present all the important current news from the now numerous centres of mining activity in the North Country in a digested and convenient form. The sources of information from which our correspondent will prepare his weekly communication are correct and authoritative, and we have every reason to believe that in the future, as has been the case in the past, our Northern Ontario news will give our readers a correct impression of happenings and new discoveries in a district of Canada that annually becomes more impressive in its extent of mineral wealth and production. Our correspondent's weekly letter will be exclusive to the 'Journal,' and it is hoped will develop into a feature of this magazine, which while it will contain accurate news, will also be distinguished by the correct perspective which arises from continuity.

Matters deserving of more extended description and comment will not suffer by summarization, but where it appears desirable will be separately dealt with.

Misunderstandings between shift-bosses and the men under them are perennial. The following letter, written by an unhappy chuteman to the superintendent, was printed in the "Granby News," which states that as good chutemen were scarce the man was transferred to another shift-boss with satisfactory results:

"Dear Sir:—I very often heard from the Granby's employees say: that no man get along with B. Blank. Last Saturday night I found what I thought was exaggerate is perfectly true. I been worked for many bosses in this country and I noticed always that they could obtain as much and probably more work from their men without use any rough Language. We chutemen the trouble we have as: big muck, timbers, rails, pipes in the chutes headache from the powder, car off the track 10,000 compinations to get hurt. All this trouble is not enough for the money we get but we got to listen the educationless shift boss's bad words "as side dish." For the second time B. Blank offended me last Saturday night without any reason, but just because I'm Italian and also he had the mouth to talk with not because he had any brains. I told the motorman to report me off yesterday I don't like give any more chance to get me in trouble. I soon lose money than my liberty. I thank you for your valuable time you spent to read my important communication and pardon me to not call at your office personally because I think I can explain myself better in writing and this will cause less disturb too."

The Princess Colliery Tunnel, Sydney Mines, N. S.

An Unusual Connecting Survey, Made Through an Undersea Colliery Waste, Affected by Creep

By JAMES PURVES,
Engineer, Nova Scotia Steel & Coal Co.

In presenting the following, there is no idea of giving to those, who may deem it worth while reading this article, any new or original ideas. Nor is it intended to infer that anything out of the ordinary was achieved. It may, however, be interesting to some, inasmuch as it is evident that, considering conditions under which the survey was made, and the many opportunities afforded for personal errors to creep in because of difficult instrument positions and long tiring periods of work, that undoubted errors of comparative minor importance, evidently in the long run offset each other to such an extent, that results were remarkably good.

In "Princess" Colliery or "New Winning" as it was known, operated by the General Mining Association from 1868 to 1901, and since by the Nova Scotia Steel & Coal Co., the submarine areas were practically mined out in 1913 to surrounding areas held by Dominion Coal Co.

The Nova Scotia Steel & Coal Co. had acquired areas beyond the Dominion Coal Co. at a distance of two miles further out to sea. In order to win these areas it is necessary to go through the Dominion Coal Company's territory; and two square miles were acquired by lease for this purpose from the Dominion Coal Co.

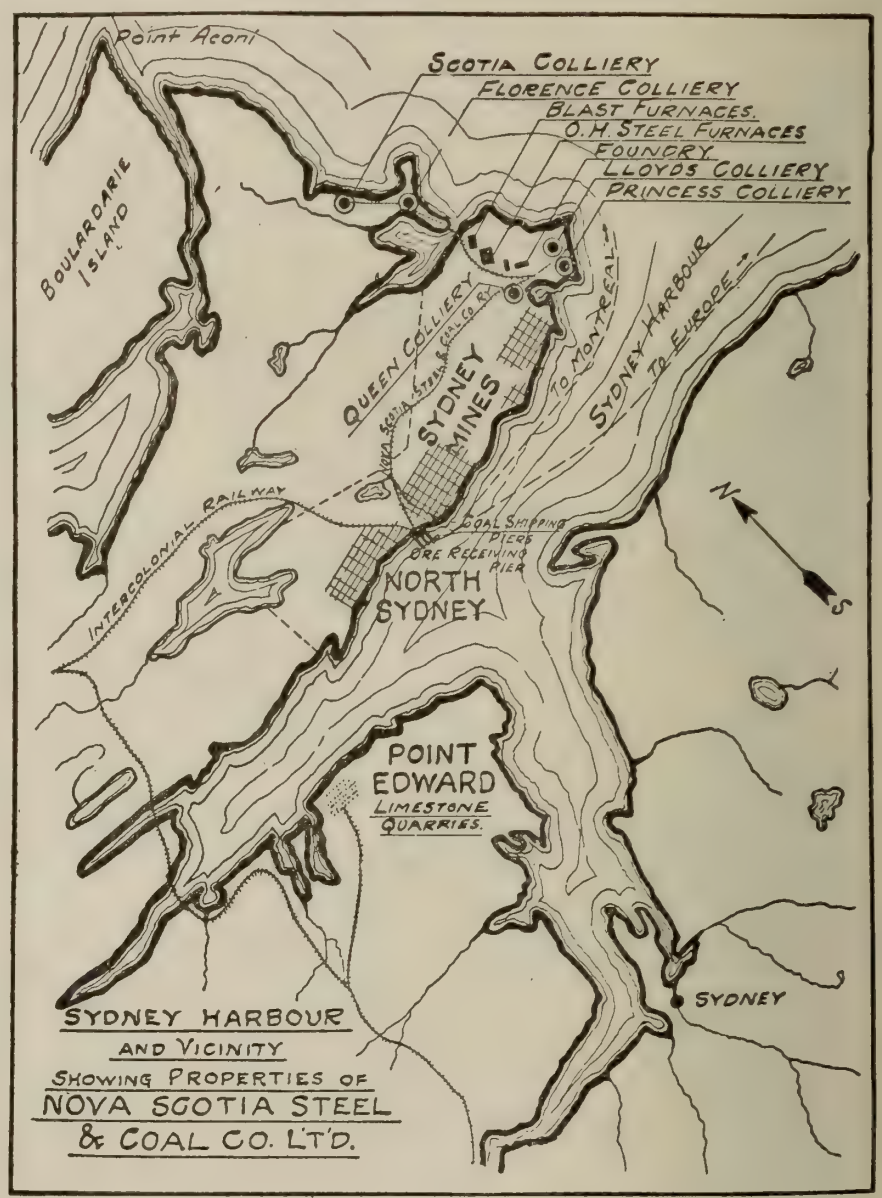
The relative location of these two square miles of what might be termed connecting leases; to the main hoisting shaft at Princess Colliery, fixed rigidly the direction in which deeps had to be driven in order to ultimately handle coal efficiently over a route which will be from four to five miles long, probably longer . It will be readily seen that this main outlet for the Colliery output had to be straight or rather it was admitted that if straight, haulage problems would be made easier and operating, generally facilitated for all time. In order to bring this new coal to the pit bottom on a straight road, it was necessary to tunnel through the old workings a distance of about 8,000 ft. Many of the districts in the old workings through which the tunnel would pass, had pillars drawn, and of course was all down. Most of the old rooms and pillar workings were also in a fallen state.

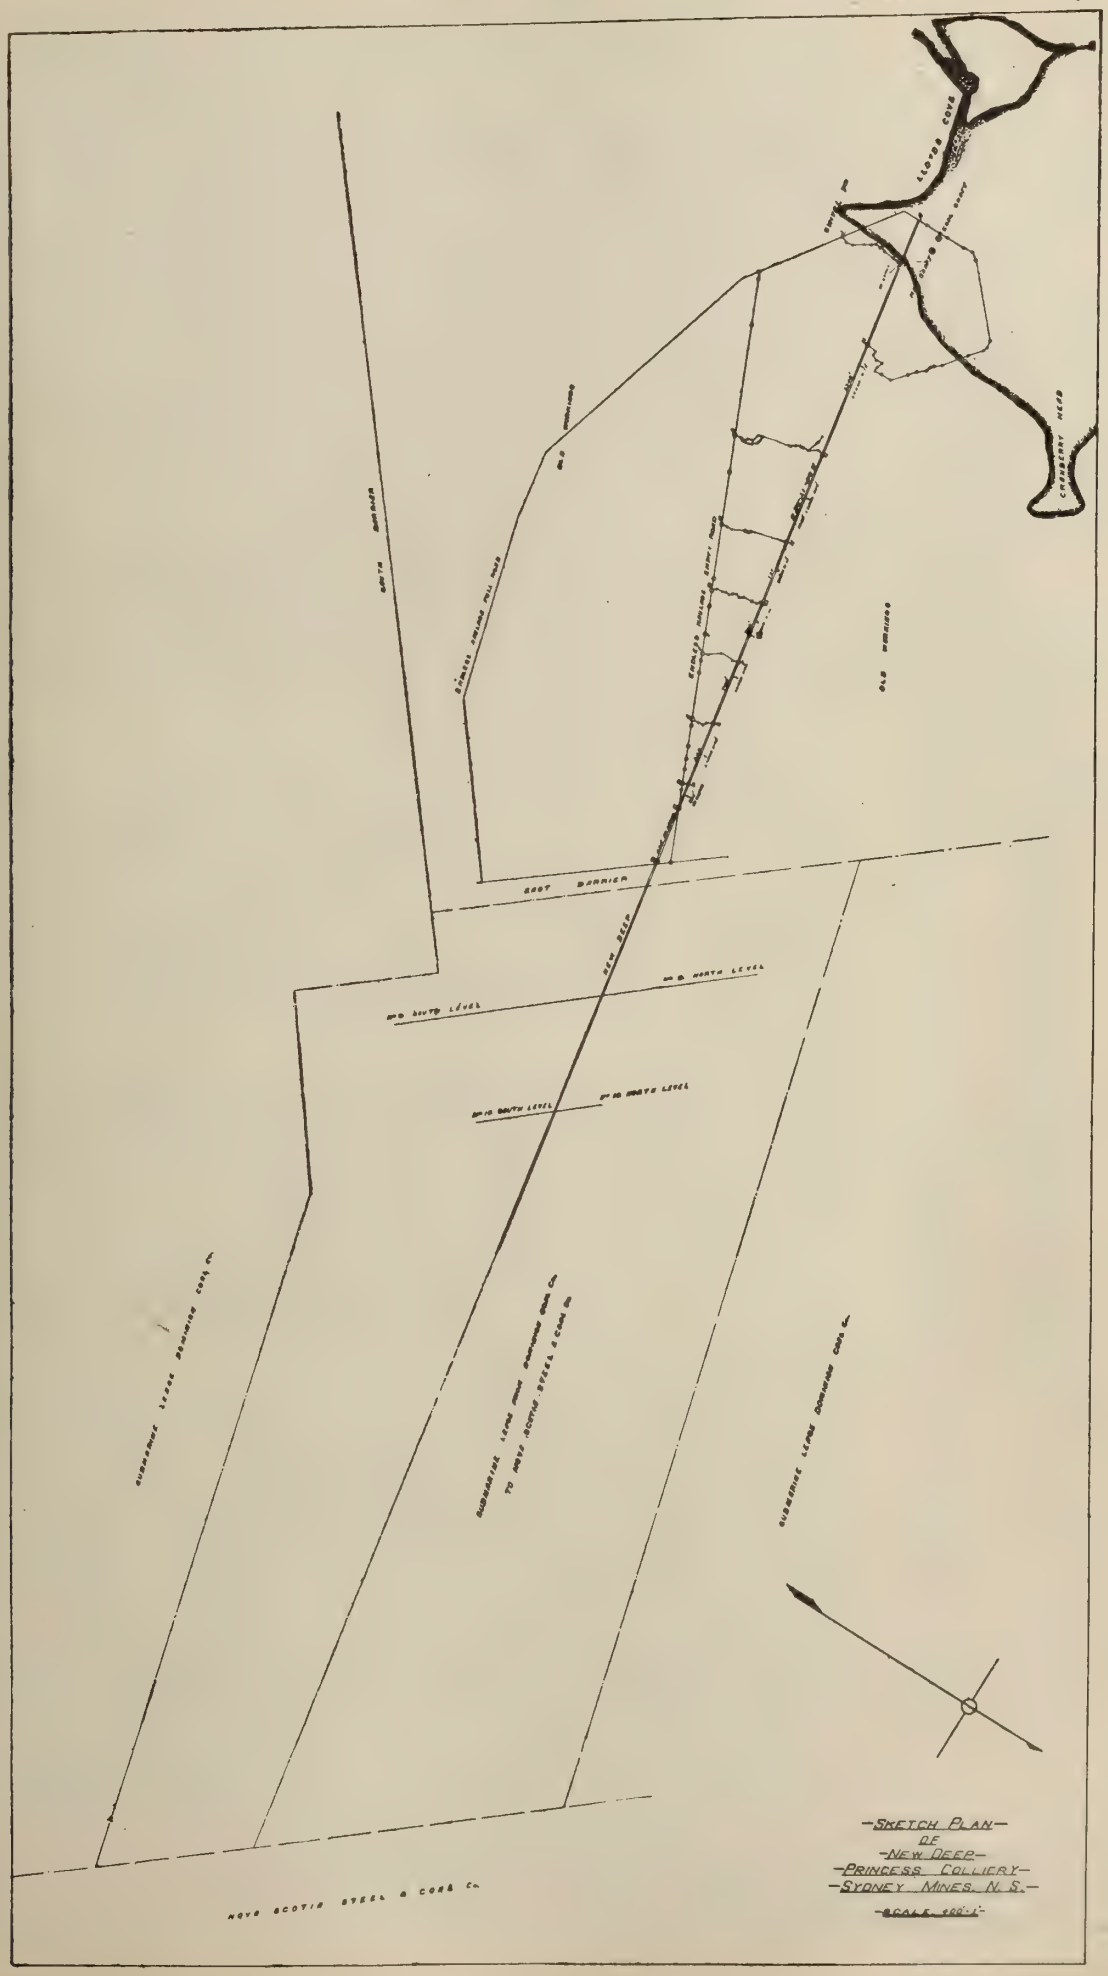
The chief difficulty presenting itself to all in tunneling through these old workings was to find a place to stow the debris, and from the first it was remarkable how little open space was found available. Therefore, apart from the time that would be required to complete this work from a fewer number of openings it was necessary to get as many faces going as possible, with the hope of finding suitable stowing room.

To this end, old levels were ribbed in at eight different points along the old haulage way. The positions chosen for ribbing in to the locus of the proposed deep just about approximately divided the overall distance.

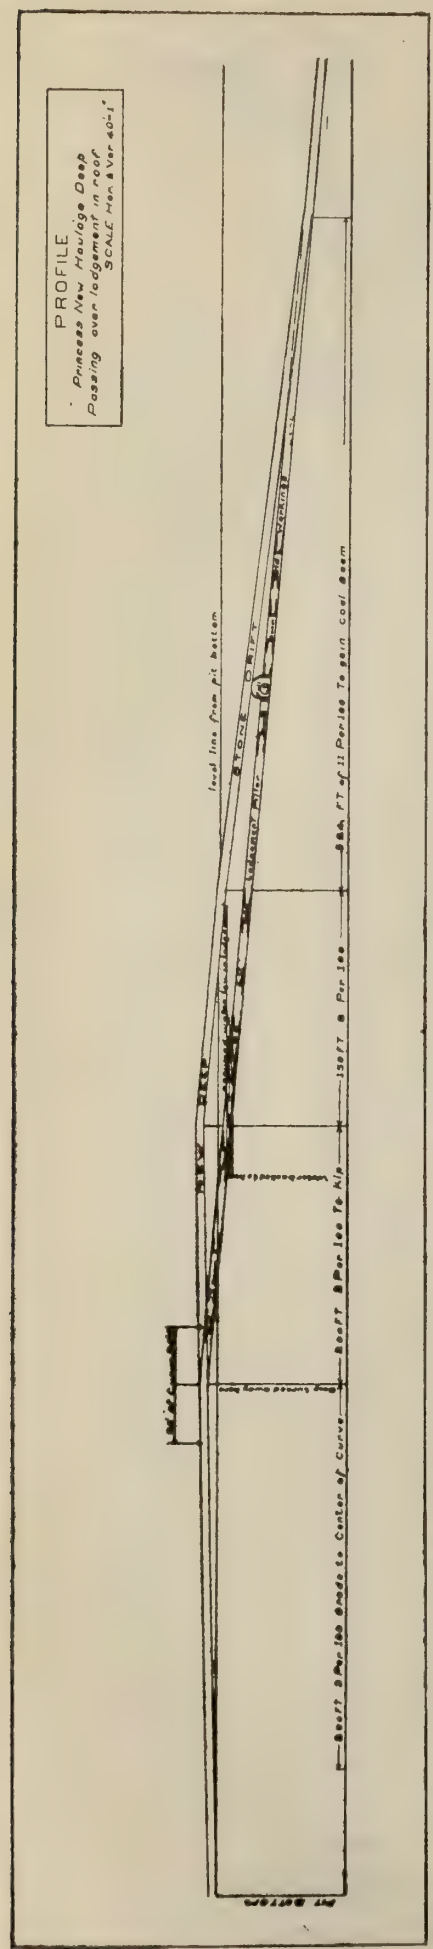
The accompanying sketch illustrates what the writer has been trying to explain.

Mention has been made of difficulties in making the survey, or rather difficulties that appealed at the time. Some of them may be mentioned; for instance: Some districts were undergoing a "creep." If not undergoing creep at the time, creep was possibly brought on or





-SKETCH PLAN-
OF
-NEW DEEP-
-PRINCESS COLLIERY-
-SYDNEY MINES, N. S.-
-SCALE 100'-1"-



accelerated by the ribbing in of old workings in order to find a place of beginning. As a consequence all marks in these districts were constantly shifting their position. In many places, check surveys proved angles to read differently at all times and as much as two minutes of arc in a distance of 50 feet was noted over a period of 48 hours Every time the instrument was taken into these districts for purposes of alignment, it necessitated a re-survey from some point known to be dependable. These places, cleaned out or ribbed, for no other purpose than to get in with an instrument were not always boulevards, nor were they any higher than necessary to say the least, and with all had to be timbered. Furthermore, the line of least resistance was invariably followed, and as an average length of sight in one case to locus of deep was 88 ft. for nine settings of the instrument, it can be well imagined that the instrument was squeezed into many difficult positions in order to get as long a range as possible or even to get along at all. The work of worrying into the old gob with pick and shovel, horse and tram, in order to find position, was prosecuted day and night, and the transit was there at all times, but the survey could not hold up the work for long; the annoyances encountered can be left to the imagination. Morals suffered extremely.

There is a gentleman of the writer's acquaintance working for a sister corporation to the south, who could have done justice to the occasion, but while his remarks would have been literature, the same remarks would possibly not have been interesting to a publisher.* (See p. 794, Journal, Oct. 15.—Ed.)

Taking it all through, there was every reason to fear that in spite of every care, errors would be bound to creep in sufficiently serious to put alignment badly out, and necessitate a widening of the tunnel on one side or the other, in places, to permit a readjustment of centre line, and indeed until all connections were made this nightmare was ever present.

Referring to accompanying sketch, the survey was begun at pit bottom on April 25th, 1913, after previous plumbing the shaft, and tying up the shaft plugs with No. 1 monument at General Office. (This monument is tied up with all Company lease corners.) The survey was carried down the empty rope side of the endless haulage system, a distance of 8,944 feet to a point at the barrier previously established on the new proposed deep centre line. This point and a point fixed 300 ft. south of the pit bottom were the objectives to be lined up, and the production of a line through these points would reach the outside submarine areas of the Company at a desired position and at the same time pass through the leased areas in such a direction as to give a two-sided pit all through.

This survey was checked back from barrier to pit bottom over the same route, but on different points; all horizontal angles were redoubled and vertical angles read to minutes. All measurements were made on the plane of the coal, and afterwards reduced to horizontal measurement. This survey was considered a base survey and checked over very carefully. The conditions under which this part of the work was done were comparatively good. The Haulage Deep was straight for long distances, the average cross section of the roadway throughout being about 10 ft. wide by 5 ft. high, giving a fair opportunity to see over, or by coal tubs. These tubs were left on the rope during the survey which was made at night rather than disarrange the operations of the colliery the following day.

Small brass hooks were used for stations, these hooks being screwed into plugs drilled for and driven into the rock roof. From these hooks the plumb bob was flung on a fine line. By holding the white reflector of a Hirsch electric lamp behind this line, it was clearly visible and distinct at 500 feet.

Care was exercised in holding the bulb of the lamp directly in line behind the string for sights longer than 500 ft. or at points so distant that the string was not visible. On the satisfactory completion of this survey, the latitudes and departures of the objective points A and B were calculated and the direction of the closure established and turned off at A and B.

At B the work was begun up and down. It might be interesting to say that at A the tunnel had to be thrown up into the rock roof in order to pass over the main water lodgement at the pit bottom, dipping again as shown on accompanying profile to meet the coal at a point 1,016 ft from A.

After work at A and B was begun, the position on the endless haulage deep where the new centre line crossed as shown marked C was established by calculation and work was begun at this point up and down.

Points on the Base Survey were then chosen at D, E, F, G, H, I, and J, and a start. made to clear, through old workings, a way for survey, into the locus of the new deep centre line. The rough distance these places had to be driven was scaled and when nearing the centre line, calculation for true position was

Sample page from Note Book.

made by fixing a direction along the line of adit and solving the triangle for distance along the adit in the fixed direction, for the point of intersection with the tunnel centre line. Possibly the establishing of these intersection points warrants the accompanying illustrative diagram.

In addition to the intersections fixed for intermediate working points, a tedious survey was made across to the old north side and in an old angle deep below the lodgement, to an intersection with new centre line. This deep was partially standing and advantage was taken of this to carry a survey in here for the purpose of intercepting the closure between points I and J, and thus proving the correctness of the work that would be done up to this point. It is interesting to note that the centre line ultimately passed 1¼ inches north of this point—marked K on the accompany plan. It may be noted here that the position J as found was in the old workings in the coal. The tunnel overhead at this point about 12 feet; in process of dropping to meet the coal. When J on centre line was found, the roof was blown down until the grade of the tunnel was reached, and the work prosecuted up and down as before.

The position at which each place broke through is indicated on the accompanying plan and also the amount of error in alignment. It is to be noted that the greatest error in alignment occurred between points only 700 ft. distant one from the other, and, that almost perfect checks were made at other connecting points much further apart. The most satisfactory connection made being between the points furthest apart, in other words, between I and J a distance of 2,300 feet, where the established centre line in each place met on a plug 3" in diameter, the error being about 2½ inches.

While it is evident that the number of places worked and consequent cutting down of distances to the various points of connection kept possible errors within reasonable bounds yet the smallness of these errors was a source of satisfaction and congratulation, and indicated as stated at first, that an important survey may be undertaken with ordinary field equipment, and in the over all, unavoidable personal errors will more or less eliminate themselves in the end. The instruments used were Gurly Light Mountain Transits, tried daily for adjustments of colimation and level.

Some Elements of Economy in Air Compression

By WM. CARTER, A.M., A.S.M.E.

Second only to electricity in the extent and diversity of application, compressed air is one of the most important agents in every phase of the development of civilization. In the arts, sciences and manufactures, its use has wrought economies which could otherwise never have been realized. Compressed air appliances have exercised an influence upon improved standards of living, second to no other means of power transmission and application. Wherever properly applied, they have brought about economic results which are reflected in every field of activity. But the efficient application of compressed air presupposes an efficient source of compressed air. The most economical devices cannot work to advantage under a high cost of power.

The cost of compressed air for whatever purpose or however produced, involves three separate items: —first, interest and depreciation on the investment for compressing equipment; second, cost of operation; third, cost of maintenance or up-keep. Extravagance in any-one, will offset savings in the other two. Compressed air can be had at minimum cost only when each of these three items is minimized. All three depend fundamentally upon the design and construction of the air compressor.

An air compressor is a machine for transforming energy from one form to another and is to be considered as promarily made up of three parts, namely, the driving element, the compressing element, and the mechanical structure, combining these two which may be designated as the power transmitting element. It is not always possible to draw the line sharply between these several elements, but the subdivision can be made with more or less exactness.

In the transformation of energy there is a certain loss. The measure of efficiency of an air compressor is the ratio of the horse power applied as initial energy to the horse power represented delivered. The inevitable losses in air compression may be broadly classed under five headings, as follows:

The first loss is that due to friction in the mechanical structure which transmits the power from the driving to the compressing element. The second loss is that arising from the heating of the air during admission to the cylinder, resulting in a reduction of its density and a diminished volumetric efficiency of the cylinder. The third loss arises from the heating produced by compression and its effect upon the air during compression, calling for more power. The fourth loss comes from the reduced volumetric efficiency of the cylinder due to the fact that the intake air is seldom at atmospheric pressure owing to friction in the inlet valves and passages. The fifth loss is also one of volumetric efficiency due to the effect of the clearance air in reducing the effective length of the admission stroke.

These various losses can be kept down to the minimum by correct design, and construction, but they can never be entirely eliminated. It is not possible even to give average percentages for any one of these losses, which may occur in different combinations, depending upon the mechanical details, the general type, the speed and the capacity of the compressor. After all these losses have been deducted the net efficiency of the machine remains, and of this Mr. Frank Richards says, "It is safe to say that the ultimate efficiency never goes as high as 80 per cent, while it often goes below 60 per cent.

Taking up now in order the three primary parts into which the compressor has been divided, the driving element comes first for consideration. Air compressors can be broadly defined as either steam driven or power driven.

The ordinary steam driven compressor is simply a steam engine with one or more air cylinders directly coupled on an extended piston rod. With this understanding it will be unnecessary here to enter into any detailed consideration of the design of the steam end. What constitutes good steam engine practice is the best compressor practice so far as the steam end of the compressor is concerned.

However, there is one vital distinction between steam engine and compressor practice. The steam engine for ordinary power purposes must maintain a constant speed irrespective of load. The steam driven air compressor, on the contrary, in order to maintain its output of air properly adjusted to its load, must run at a variable speed, for its piston displacement or its capacity is directly proportional to its speed. This means that while the steam engine has a variable load per stroke, the air compressor has a constant load per stroke, except for the small discrepancy due to varying friction and compression efficiency at varying speeds.

This feature has no particular bearing upon the performance of air compressors with simple steam cylinders, but it has a most important bearing upon the application of compounded steam cylinders to compression work. The first essential of successful steam compounding is in maintaining the proper ratio of expansion. This means that for a given steam pressure, for a given back pressure and for a given cylinder ratio, there is one and only one proper point of cut-off for both steam cylinders.

In any given case the first and third conditions must be considered constant, leaving the second condition as the variable which is to be adjusted to meet varying conditions. Where a constant speed must be maintained regardless of load this must be accomplished by change of cut-off; and in compounded steam cylinders this immediately destroys the proper ratios of compression and sacrifices economy. Constant speed practice with compound engines must be a compromise even at the best.

But in the air compressor, where the load per stroke is constant, the cut-off on the steam cylinders remains practically constant and the correct ratio of expansion is maintained over the full load range. The word "practically" is here used advisedly since there is bound to be a very slight departure from perfect conditions to produce the necessary change of speed under varying load. But it will be evident that the air compressor offers the ideal opportunity for securing in highest degree the advantages of steam compounding.

It would appear proper that in steam driven air compressors the first element of economy lies in using compounded steam cylinders, operating under press-

ure which will make the saving worth while. The peculiar operating conditions of the air compressor, just explained, justify compounded steam ends under pressures lower than would be advisable in ordinary engine practice. The largest builders of air compresors are recommending compound steam ends for as low as 80 pounds boiler pressure running condensing, and for 100 lbs. running non-condensing.

The three fundamental advantages of compounded steam cylinders on air compressors may be summarized as follows: Lower fuel consumption and fuel cost, lower cost of boiler feed water, lower cost of boiler plant and accessories.

Turning now to the subject of power driven compressors, they are in general an evolution from steam driven types. They differ, however, from the others in the vital fact that while steam driven compressors are variable speed machines, power-driven compressors are in the vast majority of cases constant speed machines. This makes the problem of regulation quite distinct in the two cases. This point will be taken up more fully later on.

Discussing now the various methods of drive, belt drive is the most common and is always applicable except where a very short center is necessary. In such cases, so high a belt tension is required, that an undue pressure on shaft bearings is produced, manifesting itself in excessive friction, low mechanical efficiency and rapid wear of the bearings. A good rule to follow is that the belt centres should never be less than three or four times the diameter of the larger pulley, and the direction of belt motion should be such as to put the slack on top. Where ample belt center cannot be had, it is much better to go to some other form of drive.

Rope drive is perhaps the next choice, although it is seldom used where the power to be transmitted is small. It is particularly advantageous where short centers only can be had, as the grip of the rope in the grooves gives the necessary pulling power without undue tension and bearing friction. The durability and efficiency of the rope drive depend entirely upon the shape of the rope grooves and upon the use of a suitable number of ropes so that no one rope is under excessive strain.

The use of tighteners, whether for belt or rope is always to be avoided. There may be cases where there is no alternative, but probably were the facts known, they have cost far more than they are worth in the increased repairs and larger power consumption. A recent development by one of the larger builders however, opens up large possibilities for belt drive on close centers without any increased friction. This arrangement involves the use of a floating idler pulley and a very slack belt. The weight of the idler takes up the slack of the belt and increases the arc of contact on the driving and driven pulleys so that the full power is transmitted without any undue strain on the bearings or on the belt itself.

Gear drive and silent chain drive are never desirable and should be used only where the demand for compactness renders them imperative. The best practice places the limit of power for gear drive with a raw hide pinion at 40 H.P..; for gear drive with a steel pinion at 60 H.P.; and for silent chain or herringbone gear drive at 50 H.P.

A very modern development is the direct-connected electric driven air compressor with the rotor of a slow speed motor mounted directly on the compressor shaft. This construction is not applicable to smaller units because commercial conditions limit the price to be paid for a motor and slow speed motor of small power, costs out of all proportion. On moderate and large sized machines, however, this design affords the very highest possible economy in power driven compressors. Recent improvements in air valve movements and in air cylinders design which permit much higher piston speeds than ever before were considered practical, have contributed toward the success of the direct-connected compressor unit of this design. Unless the valve and port areas are very large, the compression efficiency is so greatly reduced at the customary speeds as to off-set the advantages of compactness. The choice of a direct-connected motor driven air compressor therefore, should be determined by an investigation as to whether the compressor had been specially designed for this method of drive or whether it was simply a standard power driven machine specially fitted with a motor. In the latter case, satisfactory results cannot be expected.

The same general remarks apply to the directed-connected water wheel compressor. But as this style of drive is comparatively rare and can be used only where the head and volume of water are exactly right, this condition is not likely to come within the experience of the average engineer.

The problems encountered in a steam cylinder of an air compressor are problems of expansion. Coming now to a discussion of the second element in the air compressor—the compressing element—we find here that the problems are those of compression almost an exact reverse of those in the steam end. In compressing air all of the energy applied is converted into heat. At first glance, therefore, economical consideration consideration would seem to indicate that this heat should be retained during compression. As a matter of fact, however, economical air compression depends primarily upon the thoroughness with which the heat of compression is removed as fast as it is produced. Compressor practice uses one or both of two methods for accomplishing this, namely, water jacketing, and compounding or stage compression.

If the piston of a compressing cylinder could move so slowly that the water in the jacket could absorb and carry off all the heat, it is evident that this jacketing process would save all the work which is represented on the indicator diagram by the areas between the actual compression line and the isothermal curve. But in actual practice a compressor cannot be run so slowly and water jacketing is only a partial solution of the cooling problem.

Temperatures increase with the pressure in the cylinder and it is evident that the advancing piston steadily reduces the effective area of jacket. Near the end of the stroke, when pressure and temperature are highest, very little of the cylinder wall is exposed and the greater part of the cooling area remaining is the cylinder head. This emphasizes the importance of head jacketing and the superiority of those constructions in which the air valves are not in the heads, thus affording the largest percentage of cool head areas.

(To be Continued.)

Special Correspondence

BRITISH COLUMBIA.

Princeton, B. C.

An outline of what has been done and what is planned by the Canada Copper Company in the development of the Copper Mountain low grade, but exceedingly large, deposits was given recently by H. R. Van Wagenen, general manager of the company, before representatives of the Board of Trade of Vancouver and Princeton. The former were finishing a trip through Okanagan and Similkameen Districts of the Province and were being entertained by the latter when Mr. Van Wagenen gave the very interesting talk in question.

Describing the ore of the Company's new property as being not dissimilar to that of the Hidden Creek Mine, Anyox, and of the Britannia Mine, Howe Sound, B. C., Mr. Van Wagenen said that all the plant and equipment essential in the economical treatment of such low grade ore had been provided. A spur railway had been constructed connecting the Mine with the Kettle Valley Railway Co. and the West Kootenay Power and Light Co. was to put in a line for the transmission of power for operation. Labor conditions had interfered with the former work but it now was well underway and as soon as completed the recovery of ore would be started. The power line came in over 105 miles from Greenwood and 165 miles from Bonnington Falls, the source of the power. The necessary equipment was on hand for the Mill to be operated at Allenby. The site of this plant was 5.5 miles from the town of Princeton and 7.7 miles from the mine. Mill construction would mean an investment of about $1,000,000 and the installation would permit the handling of 2,000 tons of ore a day. Units were prepared in such a manner that a daily treatment of 5,000 tons could be arranged for with little additional expense. Already the Company, in preparation for the opening and the placing of its mine on a productive basis, had spent some $2,500,000, and there was no doubt that the aggregate investment, before all work was complete, would run to $3,500,000. With the outlay of the Kettle Valley Ry. Co. and that of the West Kootenay Power and Light Co., the enterprise, when it was in shape to commence making returns, would aggregate somewhere in the neighborhood of $6,000,000.

At the mine employment would be found for between 400 and 450 men. These, with their families, for whom houses are to be built, would constitute a new town of about 700 people. At Allenby the Mill would require 100 to 150 men. As a rule mill men stayed steadily in one place, settling down with their families, so that it might be expected that this would mean another town of some 400 inhabitants.

Copper products, at the present market, would amount to about $18,000 a day. There was a tonnage of 10,000,000 in sight, with an additional 2,000,000 semi-proved, added to which there would be ore at depth. The ore could be dealt with on the gravity system as the tracks and tunnels were below the lowest known ore. This ore would be run down to the Mill and the resultant product probably would be sent to the Trail Smeltery of the Consolidated Mining and Smelting Company.

Trail, B. C.

An appeal was argued recently before the Supreme Court of Canada which is of interest to the mining men of this Province, the principals between the Consolidated Mining and Smelting Company of Canada and Endersy, a farmer in the Trail Smelter District. This is an action brought by the latter against the Company for damages claimed to have been done to his farm, crops and timber by the metallurgical smoke from the Trail Smelter. The case originally was tried before a special jury which found for the plaintiff, the verdict awarding the latter $2,170. The Company appealed to the British Columbia Court of Appeal which upheld the judgment of the lower court. The case then was carried to the highest Canadian court with the same result, the appeal being dismissed with costs.

Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining and Smelting Company, from October 8 to October 14 incl., were 4,148, making the total for the year 266,543 tons. This marked decline is attributable to the strike of metalliferous miners at Kimberley, B. C. The Sullivan Mines, owned by the Company, made no production during the week because of this walk out and there is no indication as yet of a settlement of the trouble as the management refuse to negotiate with the men while they act as an organization affiliated with the One Big Union. On their part the men, hitherto, have refused to repudiate the O. B. U. The Centre Star Mine, Rossland, B. C., another Company property, continues, therefore, to be the banner shipper, having 1729 tons to its credit over the period in question. Of the independent shippers the Black Bear, Rossland, stands highest with 574 tons while the Josie, also of Rossland, which is working steadily, sent 442 tons to the smelter. Other shippers are the Lone Pine, Republic Wn., with 169 tons; the Mandy, Le Pas, Manitoba, with 298 tons; the Quilp, Republic Wn., with 270 tons; the Ruth Cedar Creek, 100 tons; the Alamo, 47 tons; and the Iron Mask, Kamloops, 44 tons.

Nelson, B. C.

The second Relief Mine, one of the promising lode properties of the Erie Camp, B. C., suffered seriously from fire in July, a forest conflagration sweeping over the property and destroying buildings and much of the equipment. A. D. Westby, manager of the Relief Mining Company, who was in Wisconsin, at the time of the fire, has returned and announces that the work of re-building will be started as soon as negotiations for the capital necessary, the success of which is said to be secured, are complete. It is proposed not only replacing what is lost but making the plant more modern. The Relief Mining Company paid $300,000 for the property which has produced in the aggregate some $650,000. Of this mine the Minister of Mines report for 1918 says that the ore is gold-bearing quartz, the gold being recovered by amalgamation and concentration. During that year eighty-five tons of concentrates were shipped to Greenwood Smelter from 1,241 tons of ore treated at the mine. Development work consists of 50 feet blind drift and stoping.

Ainsworth, B. C.

The Colorado Mine in the Whitewater, B. C. has been bonded by Wm. Martin and G. R. Crowe, two financiers of Winnipeg, Man., and the deal is expected to lead to the consolidation of this property with the

old Charleston group, consisting of the Charleston, Keystone and Kingston claims. In 1897 the latter were among the most important properties of the District and with the additional ground will be one of the strongest mineralized areas of the Slocan under development. The Charleston was quite a heavy shipper in 1896-98 but operations ceased because of the low price of silver and since that time only a limited amount of work has been done. A. J. Harris, who has been on the ground under lease, finally was able to show that with the Colorado the Charleston properties promised to become well worth while and that they certainly merited opening up on a considerable scale. The Colorado adjoins the Whitewater and lies between it and the original Charleston group. This summer a crosscut tunnel was started on the Irene, one of the Whitewater claims, for the purpose of tapping an ore body on the Colorado. The tunnel will be continued this winter. For the present only a small crew will be employed but financial arrangements already have been made for purchasing machinery necessary to permit much more extensive operations next spring.

Victoria, B. C.

Hon. Wm. Sloan and other representative mining men of British Columbia have been invited to attend the second international mining convention of the Pacific Northwest which is to be held at Seattle, Wn., from March 10th to 13th next. Glenville A. Collins has been appointed permanent Convention Chairman and Moncrieffe Cameron is the permanent secretary, both being residents of Seattle. Arrangements already are underway for the assembling of what it is hoped to take the largest and most representative mineral display ever shown on the Pacific Coast. The first International Convention, it will be recalled, took place last year at Vancouver, B. C.

The announcement that Hon. Wm. Sloan, Minister of Mines, propose taking a stand with respect to holders of placer leases in British Columbia who have failed to work the same and moreover have got behind in their rental payments has been received with expressions of approval from the general mining fraternity of the Province as well as from certain mine journals of the Northwest. It is felt, evidently, that the time has come for action of the kind, there being many in the position indicated with the result that considerable placer areas in promising districts are held, without return to the country or to the administration. If the lease holders were required to meet back payments by a specified date or to relinquish their rights there is no doubt that much placer ground at present dormant would be taken up and made to produce.

Change in Management of Premier Gold Mining Co., British Columbia.

A substantial interest in the Premier Gold Mining Company, Limited, which owns the Premier Mine, Salmon River, B. C., Canada, has been purchased by New York interests, and the management will from now on be in the hands of the American Smelting and Refining Company.

The new officers and directors of the Premier Gold Mining Company are as follows:—

President, R. W. Wood, Fernie, B.C. Canada; Vice-President and Managing Director, H. A. Guess, 120 Broadway, New York City; Vice-President, Minor C. Keith, 17 Battery Place, New York City; Secretary, W. E. Merriss, 120 Broadway, New York City; Treasurer, L. A. Chapin, 120 Broadway, New York City.

The Directors are: R. W. Wood, R. K. Neill, W. R. Wilson, H. B. Price, M. C. Keith, W. C. Potter, H. A. Guess.

Mr. R. K. Neill continues as Manager of the company.

Aftermath of Poisoning at Hunker. Widows Awarded by Yukon Gold Company.

The Yukon Gold Company has paid $2,500 to the widows of four of their employees who died from poisoning last May. After a noon meal at the Hunker Company's boarding house at Hunker many of the men become seriously ill and twelve of them died. Another widow whose husband was not employed by the Company but who was boarding at the Company's mess has been paid $1,000.

It was not clear whether this case came under the Workman's Compensation Act or not but the matter was satisfactorily adjusted on the Company's making the payment which it did. Manager McCarthy who handled the matter was fair and impartial and stated that he would have been pleased if the way could have been clear to allow even more for the woman who suffered such a great loss.

The men who were taken sick and recovered have been allowed half time by the company for all working time lost and the hospital expense for each victim was borne by the physicians having the medical contract to take care of any patients taken ill while in the employ of the company. The physicians are compensated by a medical fee deducted monthly from wages of the men.

Kirkman Creek Proving Successful.

J. T. Cooley, old time Yukon miner, gives a good report on Kirkman Creek in the Yukon district. He says that the twelve men who have been busy there this season have made good and are facing the winter comfortably fixed. It is expected that a number of others will aid to the Kirkman colony this winter.

Many of the claims which have been staked on the creek have not been prospected and there many others which could be staked. The ground needs prospecting and could handle about 100 prospectors with fair promises that it will all be as good as the ground now producing. Mr. Cooley recommends Kirkman Creek to any prospector looking for something that will leave him at the end of the winter with something to the good.

Silver Strike Babine Lake District.

A total of $1,100 per ton is a pretty fair showing. The following assay is from specimens of galena taken by Arthur Wood from his Silver Fox Group between Babine and Taltapin Lakes, and brought to the Vancouver Chamber of Mines: over 930 oz. of silver, over 1 oz. of gold, nearly 5 per cent copper, and 20 per cent lead. This was taken from a 4 ft. lead.

Mr. Wood has returned with a force of men to operate the property. It is understood that several well known local men are interested with Mr. Wood.

Our Northern Ontario Letter

A number of prospectors have left Cobalt for the scene of the recent discovery of radium-bearing ore in the township of Butt in the district of Nipissing. One party just returned from that district, declares that it appears to hold out fair promise of being an active field, in view of the find being a promising one and on account of the world-wide interest being taken in radium and its tremendous value.

Producing at the rate of upwards of $40,000 every twenty-four hours, and fully manned with efficient workmen, the mines of Cobalt are deriving the maximum benefit from the current high quotations for commercial bar silver. That a prosperous future still lies before the mines of Cobalt is borne out in the fact that a large part of the total output continues to come from high grade ore. At the Nipissing, large deposits of high grade ore are being constantly drawn from, while at the O'Brien a large quantity of ore is in sight which contains close to $5,000 to the ton. At the Mining Corporation a substantial part of the total production comes from high grade ore, while at the Kerr Lake some two-thirds of the total ore reserve is made up of high grade ore. Added to this comes official reports from the Beaver Consolidated that a vein now being opened up is being found to contain considerable ore that contains around 4,000 ounces to the ton. The Coniagas Company will end its fiscal year on October 31st with a production unofficially estimated at upwards of $800,000. Of this, it is learned in usually well informed quarters about two thirds may be found to be net profit, and at least indicates a fair surplus over dividend requirements of 2½ per cent annually, or some $400,000. On October 25th the company disburse a 2½ per cent dividend, the fourth to be paid this year. This brings total disbursements up to $9,640,000 since 1907.

Rumors persists to the effect that the Temiskaming Mining Company may reasonably resume dividend disbursements in the near future. This belief is supported by the fact that the latest report of the company showed a surplus of some $922,000. Added to this is an official statement made to your correspondent that the company has operated during the current fiscal year at a profit. This would tend to indicate that the surplus may be nearing the million dollar mark and that dividend disbursements are justified. On the Gans lot, according to official advice, some rich patches of ore are being encountered. Master in Ordinary Roche, at Osgoode, Toronto, has signed the formal legal order directing the liquidators of the Bailey-Cobalt Mines to proceed immediately to transfer the Bailey Mine and its assets on the terms of the offer made by A. J. Young.

It is said that the papers for the incorporation of the new company which is to be known as the Bailey-Northern Customs, Limited, are already being prepared and that the transfer should be completed in time for the new company to commence operations on the Bailey before the end of November, or at least as soon as the legal details are properly carried out.

Under the terms of the offer which the Court has accepted, the present Bailey shareholders will receive one share of stock in the new company for each ten shares of their present stock. The capitalization of the new company will be $1,250,000 with $50,000 in the treasury. This treasury insures the shareholders that the property can be actively operated, and the property soon placed on a producing basis.

The Tretheway-Cobalt is reported to be seeking financial aid in carrying out the development of the Castle property in the Gowganda district. The Trethewey has an option on 51 per cent of the stock of the Castle and receives shares in the company as compensation for money spent on the property. It is stated unofficially that some $80,000 worth of ore has so far been developed, and also that the Temiskaming or the McIntyre may be invited to share in its development. The report is supported in that J. P. Bickell who is president of the Temiskaming as well as the McIntyre is interested in the remaining 49 per cent interest in the Castle.

At the time of writing your correspondent finds much speculation among mining men as to what affect the present peculiar situation at Toronto may have on the Department of Mines. The members of the Provincial Parliament from the precious metal mining districts are of the old political schools, Conservative and Liberal, and at the time of writing appear to be likely to be excluded from the governing body, the farmer members. The situation presents the possibility of the voice of the citizens of this district going unheard. The general opinion, however, appears to be that nothing serious will result, and that there is not cause for undue alarm.

The Nipissing Extension mine, formerly the Farah property is being de-watered, plans for its development having been completed. A new vein has been discovered on surface on the eartern part of the property. It has been stripped for a distance of about sixty feet and has an average width of about one inch of smaltite carrying silver values of several hundred ounces to the ton. The wall rock contains considerable leaf silver and is expected to compose substantial tonnage of mill rock. This new find, as well as the one made last June will be followed by aggressive work. Major E. H. Birkett is in charge of operations.

In the Elk Lake district interesting developments are taking place. The most important is that of the White Reserve mine, in the Maple Mountain section of the district where a recent surface discovery of high grade ore has been made. A pit has been put down about 15 feet and some very spectacular ore taken out. In the meantime, a crosscut at the 140 fet. level is being driven for the purpose of tapping the new vein at that depth. As a result of previous work at the property, about twenty veins have been discovered. About 1,100 feet of lateral work has been done at the 140 ft. level. The property is equipped with a nine-drill compressor and corresponding equipment. At present two machines are working.

The Paragon-Hitchcock at Elk Lake is working, and encouraging results at the 200-ft. level are reported. A vein close to two feet in width is being explored.

It is contended by mining men who have had previous experience in both Cobalt and Elk Lake, that the latter district presents favorable possibilities of successful mining developments due to the similarity of geological conditions in Elk Lake as compared with conditions in Cobalt. It is stated that the knowledge gathered during he course of fifteen years of mining on Cobalt may be expected to be used to good advantage in the Elk Lake district.

In Gowganda a number of properties are being explored. For the greater part they all turn to the history of the Miller Lake-O'Brien for inspiration. This is the one successful mining operation in the Gowganda district, one of the richest deposits of silver in the world having been opened up and from which the company has recently been producing silver at the rate of over a million ounces annually. For a time, in its early days, the Miller Lake O'Brien appeared to be a doubtful proposition, and was only developed successfully by reason of Senator M. J. O'Brien refusing to give up, so to speak, and carrying out the exploration of the property from his private fortune. Other operators in the district, are often found pointing to this precedent, and express the thought, which is an offspring of the hope that history will repeat itself in Gowganda.

In the South Lorrain area, the Pittsburg-Lorrain and the old Keeley mine are the only active properties, although here, as well as at Elk Lake, an early revival of activity is being optimistically predicted.

In the gold mining camps satisfactory progress is being made, and there are now a greater number of operating mines than at any previous time during the past two years.

It is intimated that the Hollinger Consolidated will be a heavy purchaser of Victory Loan 1919 bonds. The present surplus of the company is well over three and a half million dollars of which close to two million is made up of bonds of previous loans. It is understood some of this may be converted into the new loan and that a substantial amount will be added to the total. The shortage of labor is still a retarding factor at the Hollinger, the arrival of Fall not having brought men in desired numbers. However, November and December are the two months that are looked to to bring the desired change and thus make it possible to prepare to operate at full capacity instead of less than two-thirds as at present. Although officials are reticent regarding the matter, current rumors tend to indicate some possibility of the Moneta property being taken over by one of the producing mines. It is reported unofficially that both the Hollinger and the Porcupine Crown have exhibited a desire to secure the property. The Moneta adjoins the Millerton side of the Hollinger on the west and seems to present fair possibilities of having the westward continuation of some of the ore bodies found on the latter. As to this, of course, only exploration and development work can determine.

The Dome Mines has recently been able to increase its capacity to about 1000 tons daily, thus handling twice the volume of the McIntyre and about two-thirds as much as the Hollinger. During one day, which was the exception, some 1,500 tons of ore was hoisted. It is plainly evident that the Dome is getting back into its stride in record time. If, with a little under 300 men employed, the Dome is able to handle 1000 tons of ore daily no further evidence is necessary to show that costs of operation are being held well with in bounds. For instance, a larger force of men is engaged at the McIntyre-Porcupine where an average of but 500 tons is treated daily and where costs are held down to around $5 to the ton.

Mr. R. E. Hore has returned to Toronto after examining properties in the Shining Tree Gold district. Mr. Hore was recently in Butt township to see the radium ore deposit discovered by Mr. Elliott.

Bullion Shipped From Cobalt.

During the week ended October 24, six Cobalt companies shipped an aggregate of eight cars containing approximately 576,213 pounds of ore.

Following is a summary:—

Shipper	Cars.	Pounds.
Buffalo	2	175,965
Nipissing	2	149,637
Coniagas	1	65,611
Dominion Reduction	1	65,000
La Rose	1	60,000
Peen-Canadian	1	60,000
Totals	8	573,213

During the corresponding period the Nipissing and the Mining Corporation each made bullion shipments the total amounting to 179,102.88 fine ounces, as shown in the following summary:—

Shipper	Bars.	Ounces.
Nipissing	76	101,048.65
Mining Corporation	79	78,054.23
Total	155	179,102.88

Annual Meeting of McIntyre-Porcupine Mines.

The annual meeting the shareholders of the McIntyre-Porcupine Mines was held on October 24th in Toronto when encouraging reports were received. While no definite statement was forthcoming as to an early increased divident to the shareholders. President J. P. Bickell said that the company's earnings had improved during the four months since the close of the fiscal year and if no unforseen difficulties arose, it looked as if the net earnings for the year now entered upon would be twenty-five per cent above the earning for the year covered by the last report. A surplus was being a accumulated and if that kept on increasing the board would be justified in increasing the distribution of profits. A by-law was ratified reducing the membership of the board from 7 to 5. The five directors previously serving were then re-elected which meant that the places of the late George E. Drummond of Montreal and E. F. B. Johnston of Toronto were not filled. Officers from the mine reported that the shaft is now down 1,500 feet and cross-cutting will now be begun for the 200 feet to reach the vein. The mine is now opened up on the 1,125 foot level.

Development of White Reserve.

Reports from the North say that the White Reserve property in the Maple Mountain section of the Elk district is undergoing considerable development, a vein recently opened showing some very promising silver. The White Reserve Mine is controlled by J. A. McAndrews of Toronto, who was associated with the Abitibi Pulp and Paper Company in the early days of that enterprise. Mr. McAndrews predicts a prosperous future for that area, including the Darby Lake and Skull Lake district. The mine is situated close to the east boundary of the township of Whitson and is about five miles northwest from Lady Evelyn Lake.

Exploring the Kennedy Group.

A report from Boston Creek states that a new company is being formed for the purpose of developing and exploring the Kennedy group of claims on the boundary of Boston, while arrangements are proceeding for the development of the Hohenaur property at Kirkland Lake. On the Mondeau property now known as the Peerless work has proved to be sufficiently encouraging to proceed with the installation of a more powerful mining plant.

To Develop the Boyce Claims.

Announcement is made that the old "Boyce group" of claims in the Porcupine district has been sold to strong Canadian financial interests in Toronto, Hamilton and Montreal. The deal was arranged by A. S. Fuller of Timins, Tanner, Gates & Co Toronto and J. R. Starnes, Montreal. The property will now be known as the Gold Centre Mines, Limited, a $3,000,000 corporation having been formed for taking over the claims. There are five claims adjacent to the Hollinger Consolidated, the McIntyre, Dome and West Dome.

Progress at the Clifton Mine.

Homer L. Gibson and a party of twelve returned to Toronto on Sunday last after several days spent on a visit of inspection to the Hollinger, Dome and Clifton Mines. The latter mine is a prospect on which developing work is just starting. The operating company has now 25 men undreground and has just completed the installation of an electric plant in order to work the 500 foot level. Mr. Gibson states that ore has been found in three veins at the first level. At the Dome Mine the party found the labor situation greatly improved and the indications are that during the winter an adequate force of help will be available.

STOCK PROMOTIONS DISCREDITING WEST SHINING TREE GOLD AREA.

Regarding the West Shining Tree gold area about which much has recently been written, and more said, the writer has consulted the opinion of two of the leading geologists of the Dominion—recognized as such by mining men of the highest standing, and as a result feels assured that an unbiased summary of the situation is this:

The geological conditions of West Shining Tree are such as encourages the belief that commercial deposits of gold ore should be found in that area. There may not be a certainty of this, but there are at least excellent possibilities. One geologist pointed out that he felt optimistic over the camp's future, and that he had found it necessary to disregard the numerous stock promotion schemes in order to become optimistic. In the opinion of both geologists, the present situation appears to be attended with possibilities of the camp falling into bad repute, getting a black-eye, so to speak, and in a sense throwing the whole thing into "near-liquidation." This, not due to lack of merit or potentialities, but due to some of the properties being saddled to, and subject to the greed of a few men who are playing the stock end of the game.

"I am optimistic about the potentialities of West Shining Tree, and, in this, am anxious to compare notes with other mining geologists," said one of the gentlemen interviewed. "In the Porcupine camp," he said, "we all know how easily the area which now comprises the paying mines could have been missed if effort had ceased with such early discoveries as the Rea. I am optimistic about Shining Tree, not that I feel certain that mines have already been found, but in the hope that owners of claims will remove a little more moss, expose a little more rock and perhaps as a result make more important discoveries than those already made."

In the gold mining camps of Northern Ontario the propositions in which brokers have played a leading part have practically all landed in the scrap heap. It is a broad statement, but it is true. The profitable operations do not owe their success to the brokers. In their order of importance they may be cited: First, the Hollinger is the product of the optimism of the Timmins Brothers and their Montreal and Toronto associates; second, the Dome, is the product of first the Mond Nickel Company, and later Mr. De Lamar; third, the McIntyre became successful owing to the efforts of the late Col. A. M. Hay; fourth, the Lake Shore was brought to a profit-producing basis by Harry Oakes, the proposition being adversely criticised by disgruntled stock brokers because they were refused the opportunity of using the Lake Shore as a means of fleecing the public; fifth, the Porcupine Crown won success through the efforts of the Crown Reserve Mining Company.

If some system could be devised whereby the brokerage houses, or a great many of them, could be prevented from exhibiting unreasonable greed, and permitted to devote themselves earnestly to the work of soliciting capital to be used in the exploration and developing of mining prospects, the mining industry of this country would be greatly benefitted. To this end it would be necessary to limit the amount of commission which the brokers might charge for selling unlisted stocks. As matters now stand, they are permitted to underwrite stock at perhaps 10 cents a share and sell it at 20, 30 cents or whatever they are able to get. Instead of the money finding its way to the treasury, everything above the underwritten price goes to the broker, sometimes amounting to more to the latter than to the treasurer. Such, of course, quite obviously reduces the chances of developing mining property successfully. When the difficulty, under favorable conditions, of developing mining property from a raw prospect to a dividend-paying mine is considered, it is indeed small wonder that so many of the propositions with which the broker is associated and gets his "hand-out" should fail—hence the fear that the promising West Shining Tree camp is saddled with a condition that will ultimately be found to have done it an injury.—J. Mc.R.

The remark, we so often hear, "Ore is where you find it," always reminds me of the old Cousin Jack (Cornishman) tributer, when asked how his 'pitch' was looking, who said: "Thee knows 'ow they bloody h'ore ez, me son, sometimes ez 'eer and sometimes theer, and weer 'ee edden, theer be oi." In plain English, "You know how ore is, my son, sometimes it's here and sometimes there, and where it isn't there am I." I claim that to be pretty pat.—Extract from a letter to the Editor of M. & S. Press.

Considerable interest is being taken in Nigeria in a new discovery of silver-lead. There is a highly-mineralized belt of about 50 miles in length, and ore bodies have been located up to a width of 50 ft.

Nova Scotia Notes

It is announced the Dominion Steel Corporation has subscribed $25,000 to the erection of a general hospital to serve the Town of New Waterford and the surrounding district, where the Dominion Coal Company has now five collieries in operation. The present hospital, which is only a temporary arrangement, is quite inadequate, and the need for a larger hospital has been long felt. The revenue for the work of the Hospital will be derived, as is customary in the Glace Bay district, from monthly contributions by the colliery workmen, from provincial and municipal grants donations from the colliery companies and private subscriptions.

The Dominion Coal Company has recently equipped and opened a clubhouse for its officials at Glace Bay. The club is handsomely furnished with library, billiard-room and the usual club appointments, including a ladies' section, and provision for meetings and official dinners.

The Dominion Coal Company, according to newspaper reports, contemplates immediate operation of its areas in the North Sydney field from Bonar Head, contiguous to the workings of the Nova Scotia Steel and Coal Company. This report would appear to indicate the unlikelihood of any amicable arrangement between the Dominion and Scotia companies for the partition of areas in this locality.

It is announced that a zinc-copper-lead property held under lease by James Nolan of Glace Bay has been placed under option to Capt. P. J. Webb of Sydney, who is endeavoring to dispose of the property to American interests.

The leases cover areas near Stirling, Richmond County, Cape Breton Island. Some $40,000 has been expended in proving the property, and it is stated that ore of good quality has been exposed along the general direction of strike for about 1,000 feet, showing a width in one trench of 66 feet. Analyses of the ore are said to have shown 33 per cent zinc, 13 per cent lead, 3.68 per cent copper, with important yields of associated gold and silver.

The following account of this mineral occurrence is contained in the Summary Report of the Geological Survey for 1918, part F, by A. O. Hayes.

Stirling, Richmond County. — Descriptions of the development work on the Stirling zinc-lead-copper deposit previous to 1918 were published by D. D. Cairnes [1] and A. O. Hayes [2]. No development work was done from July 17, when the Stirling Exploration Co. stopped driling to July, 1918 when the New Jersey Zinc Co. commenced operations under an option to purchase from the original lessee, James Nolan of Glace Bay. J. T. Boyd is in charge of the present development work by which it is planned to prove the deposit at a greater depth than accomplished by the Stirling Exploration Company in 1917. Five calyx drills removing 3-inch cores were in operation, putting down holes at 35 degrees from the vertical. The drills were placed east and west of the line of extension of the deposit and boring carried on from opposite sides. The gangue, which varies from dense quartz to somewhat porous carbonate schist, offered great difficulty for the type of drills used and progress was, therefore, made more slowly than anticipated.

The drilling in 1917 indicated an impoverishment of the ore both laterally and in depth from the principle showing illustrated as Trench C in D.D. Cairnes' summary report [1] for 1916. Towards the south there is a heavy overburden of boulder clay and surface trenching is impracticable. The drilling 400 feet south of Trench C showed no ore, whereas 200 feet south of French C the ore-body was much smaller than the holes drilled under the principal showing, which also showed gradual impoverishment to a very low grade ore between vertical depths of 200 to 350 feet. Surface trenching at intervals to the north of Trench C shows a splitting of the higher grade ore into narrow bands which terminate entirely about 500 feet north. A hole drill hole placed about 200 feet north of Trench C shows similar characteristics at depths of 150 to 300 feet vertically with low grade ore predominating.

In September 1918, a boring on the west side of the known deposits entered ore, indicating the presence of another band. The lenticular form and magmatic source of the ore suggests the probability of the occurrence of additional related ore, both laterally and in depth.

The country rock consists of a volcanic series of pyroclastic rocks and lava flows of rhyolite and trachyte, with interbanded carbonates of lime magnesia and iron, apparently alterations of the volcanic rocks. These are intruded by plutonic rocks consisting of diabase, quartz porphyry, and a porphyrite. There is also a dyke of mica diorite cut in a diamond drill hole at the south end of the ore-body and in a trench at the north end of the ore-body a similar dip is about 10 feet thick. This dyke was not encountered in any of the other drill holes, although they penetrated the intervening formation; therefore, two different dykes may occur. Although no large exposure of this rock was found in the vicinity of the workings, a similar intrusive plutonic rock occurs in large quantity, cutting a similar volcanic series, on the coast west of Seal rock between Framboise and Capelin cove about 5 miles south of Stirling.

The whole series has undergone metamorphism accompanied by shearing with the development of a schistose structure, having a strike of north 31 degrees east (astronomic) with steep easterly dip. The ore appears to lie along one of the shear zones. The ore consists of a fine-grained, intimate mixture of the following sulphides in order of their abundance; sphalerite, pyrite, galena and chalcopyrite, containing small amount of gold and silver. The ore varies from high grade, consisting of an almost solid sulphide mass accompanied by a small amount of gangue, principally calcite with subordinate quartz, to low grade, largely calcite with some quartz, containing a small amount of the sulphides disseminated through it in small masses. In the lower grade ore there is a greater proportion of pyrite to total sulphide contents, than in the higher grade ore.

THE APPLICATION OF PULVERISED COAL IN BLAST FURNACES.

The Canadian Mining Institute Bulletin for July contained a description of the progress made in using pulverised coal in blast furnaces which made the following references to the smelting of iron:

History of Early Attempts.

"The use of pulverised coal in reverberatory furnaces, cement kilns, open hearth furnaces, boilers and other similar furnaces, has been dealt with extensively in many papers and publications; the present paper on the other hand will be confined to the application of pulverised fuel to blast furnaces, wherein the mixture of fuel and air is injected into the lower portion of a piled mass of material, and combustion takes place under pressure.

Until recently the history of pulverised coal in blast furnaces contained nothing but records of failures. Sir Lowthian Bell, in his book on the "Principles of the Manufacture of Iron and Steel" published in 1872, which deservedly ranks among the world's metallurgical classics, mentions an attempt to introduce finely divided coal with the blast at the tuyeres in an iron furnace; the attempt was soon abandoned, and Bell remarked that it needed but little consideration to insure rejection of all such schemes.

About 1902, Mr. W. J. Forster of Darlaston, England, satisfied himself by a great number of experiments at the Darlaston furnaces: "That nothing but failure can be expected from the addition of cold materials into the hearth of the furnace with the blast."

Possessed of this opinion, Mr. Forster suggested the use in the blast furnace of a specially prepared carbon obtained by heating solid carbon to a very high temperature, so that all volatile matter and moisture should be expelled and the carbon should be strongly heated before its use in the blast. He obtained British and American patents on the expedient of so preparing carbon and introducing it with the blast, whereby he hoped to make special grades of iron. The idea seems to have produced no effect upon the art of smelting iron, but it may be considered to illustrate the rest of the history of the use of pulverised fuel in blast furnaces as this history consists of sundry comparable suggestions of expedients all of which have, so far as known, failed to meet with practical success. The efforts to use successfully pulverised fuel in iron blast furnaces have embraced such expedients as the substitution of heated gas, with and without superheated steam, for some or all of the air; the careful classifying of the fuel into different and distinct sizes with a view to employing the finer grade to create a high initial temperature to ignite the rest; the substitution of an annular reverberatory arranged around the base of the charge, and the injection tangentially thereinto of the powdered coal and air; the grinding and mining of the charge itself so that the particles might fall through a stream of burning fuel and air, and so on. It is not profitable for present purposes to consider all these expedients or the various patents which have been granted on them, because, so far as is known, none of them has been sufficiently successful to secure adoption.

The results obtained by the recent work which we shall now describe have been attained not so much by resort of extraneous expedients as by the development of the combustion process itself. The chemical phenomena of combustion are relatively little known, although they have been made the subject of important research work by numerous scientists since the days of Bunsen, who, in 1845, made investigations on a coal-fired blast furnace used for the smelting of iron ores; and it is impracticable, within the limits of this paper, to discuss these phenomena in detail. The phenomena apparently embrace distillation of volatile matter, gasification, and combustion. When a mixture of air and finely divided fuel is directed into and against a mass of more or less refractory material, different results may ensue, according to variations in a multiplicity of factors. The work to be described seems to demonstrate that by proper provision of suitable space for combustion, maintenance of correct air pressure and fuel within the combustion space, it is practicable to develop within the charge a sort of supercombustion, which provides at greatly reduced cost the heat necessary to bring the charge to a molten condition. It is particularly difficult to generalise or define the possibilities or limitations of the generation of heat in a blast furnace so operated, for much depends upon the physical and chemical characteristics of the charge, as well as upon the variable factors directly entering into the combustion."

The authors suggest that a better idea of the work can be obtained by concrete illustration, and proceed to describe in great detail the experiments of Mr. Garred in a field which, the authors believe has heretofore been untouched even by suggestion, namely, the melting of copper and the smelting of copper ores.

At the plant of the International Nickel Company the most recent work has been to operate the furnace entirely without coke, following earlier work where an average of fifty per cent of the coke had been replaced. The results, with all coke eliminated, are sufficiently encouraging to continue the experimentation with this object in view.

The processes involving the application of pulverised fuel to blast furnaces have been patented in the United States, Canada, and many foreign countries; the patentees, Garred and Cavers, both being engaged in work connected with the smelting of non-ferrous ores, and both were simultaneously working on practically the same problem, of the combustion of finely divided fuel in a blast furnace. Owing to the magnitude of the problems involved, a consolidation of their interests was effected recently, by the formation of the Garred-Cavers Corporation, New York, which company has acquired the patents issued and pending in connection with this work. It is expected that experiments on the smelting of silver-lead ores will be commenced in the near future, and there is every reason to believe the prospects are good for increasing the efficiency of blast furnace practice.

During the last few years, some twenty to thirty million tons of non-ferrous ores per year have been treated in blast furnaces in the United States, Canada and Mexico, and it is believed that further developments of a satisfactory nature in connection with this work will enable a large proportion of these ores to be smelted with considerable economies in fuel.

The Garred-Cavers Corporation has made contracts and issued licenses for the use of its process by the

International Nickel Company of Canada, the Tennessee Copper Company and Cerro de Pasco Copper Corporation. Mr. W. J. Hamilton is Consulting Engineer to the Cerro de Pasco Company and arrangements have been made to utilize pulverised coal in the existing blast furnaces at the smelter, but also in a new smelter to be constructed by that Company.

While the application of pulverised coal, in its present development, does not extend to the smelting of iron in the blast furnace, it does not appear unreasonable to expect that the lessons learned from its use in non-ferrous smelting may lead to a wider application that may some day include the reduction of iron ores.

PERSONALS.

Mr. J. B. Tyrrell, accompanied by Mr. P. A. MacDonald, Public Utilities Commissioner of Manitoba, Mr. Phillips and Mr. McTavish, left Winnipeg recently to make an examination of the Gold Pan Mine in the Rice Lake District.

Mr. J. B. Tyrrell addressed an open meeting held in the Fort Garry Hotel, Winnipeg, under the auspices of the Manitoba Branch of the Canadian Mining Institute. The subject of the address was "The Mining Situation in Its Relation to Manitoba." Having recently returned from an extended trip through Northern Manitoba, Mr. Tyrrell was able to entertain his audience with an authoritative account of the mineral possibilities of the Province.

The Prince ready to go underground at the O'Brien Mine, Cobalt.

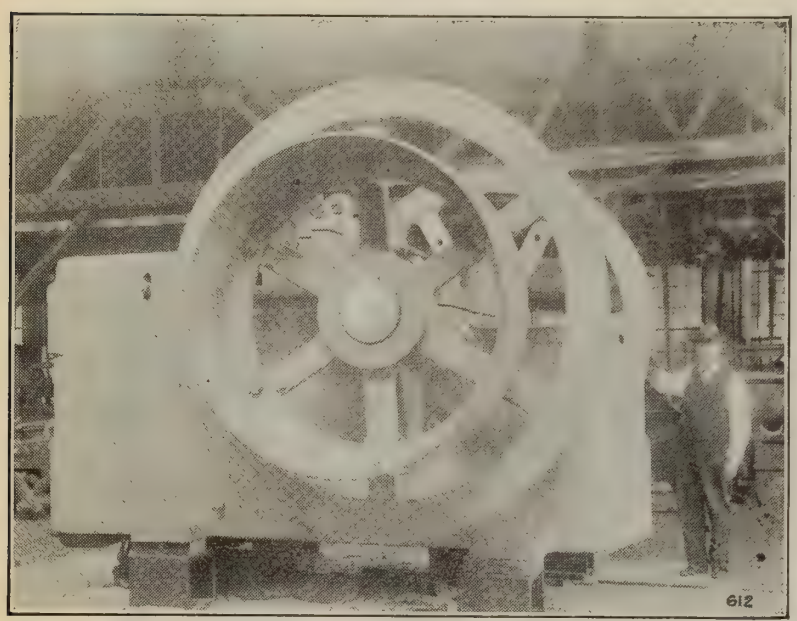
Mr. Hughes, the Prime Minister, has stated in the House of Representatives of the Commonwealth, that the Imperial Government had promised to advance £500,000 for the purpose of fostering the treatment of spelter in Australia, and the Commonwealth would also assist in the establishment of similar works.

Arrangements are being made by the Manitoba Branch of the Canadian Mining Institute for a lecture to be given by Dr. R. C. Wallace, Commissioner of Northern Manitoba and Chairman of the Branch. The meeting will be held in Winnipeg on October 23rd, and no doubt the speaker will deal with some aspect of the mining situation in Northern Manitoba.

LARGE ROCK CRUSHER BUILT IN CANADA FOR THE ASBESTOS CORPORATION.

One of the largest rock crushers in Canada has recently been installed at the British-Canadian Mines of the Asbestos Corporation of Canada, Limited. The bulk of the machine is clearly indicated by comparison with the man standing beside the rock crusher. Larger crushers have, of course, been built; but as a rule for special purposes, and not as far as the writer is aware, by any Canadian firm.

The general dimensions of the crusher are as follows:
Size, 42 ft. x 36 ft.
Weight of frame, 78,000 lbs.
Weight of swing jaw with bushing, 21,800 lbs.
Weight of flywheel and pulley, 7,000 lbs.
Weight of Pitman, 4,900 lbs.



Crusher for Asbestos Corporation.

All parts are unusually massive to withstand the heavy strains of crushing the large pieces of rock which this machine will have to handle; jaw and cheek plates are of manganese steel, and the Pitman is of bolted construction instead of being solid as in the smaller types of crusher.

The crusher is intended for primary crushing of the asbestos "mill" rock, and being able to handle comparatively large pieces of rock will effect a saving in the actual mining cost. The crusher was constructed at the Jenckes plant of the Canadian Ingersoll-Rand Company, Limited, Sherbrooke, and is the third of this size supplied to the Asbestos Corporation.

A unique mining plant is located in Ohio. Both coal and sand are taken from the one property which consists of 150 acres. The surface strata is high grade molding sand and has an average depth of about nine feet. It is deposited on a bed of shale about five feet in thickness and under this is a seam of excellent coal averaging from 4 to 5 feet. Shipments of sand already have been made to foundries throughout the country. A considerable tonnage of coal also has been mined. As the shale strata is uncovered by the removal of the sand, steam shovels will be utilized to strip the shale, thereby exposing the seam of coal which will be mined in the open.

A LARGE ROCK CRUSHER.

The modern tendency in mining engineering work is to instal larger and more powerful rock-crushers rather than to multiply the number of those in use. The largest gyratory rock-crusher in the world has recently been laid down, its dimensions being as follows: Height from foundations to the top of the hopper, 17 ft. 8 ins.; diameter of hopper, 19 ft. 6 ins., the length of the shaft, which is 10 ins. in diameter, being 21 ft. The receiving opening are 60 ins. by 190 ins. and the diameter of the rope sheave driving pulley is 7 ft.

The weight of the complete crusher is about 358 tons and it is capable of dealing with from 2,500 to 3,000 tons of rock per hour, crushing an 8-in. or 9-in. product. When running under full load the crusher requires a driving power of about 350 h.p., and it absorbs 75 h.p. when running light. The working parts are lubricated by a forced feed, a pump situated in its lower portion driving a thick oil to all bearings. The oil sump from which the pump draws its supply contains nine barrels of oil, and all surplus is returned through coarse filters to the sump. The crusher in question has been designed and laid down to deal with the output of a number of steam shovels at a big limestone quarry, the material being dumped into the hopper from trucks holding 12½ tons.

THE SILVER SITUATION.

There has been very heavy buying of silver for Far Eastern account. India would buy this country's annual yield, according to well posted silver men, if it were available and still need more. Of late China has been buying heavily, both in New York and London.

The demands of the Far East for silver have many times proved the mainstay of the market for this metal. Just what happens to the great quantities shipped there has never been satisfactorily explained, although silver always figures in trade between India and China and the Western world.

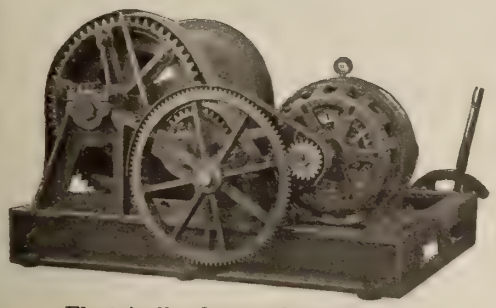
In China silver still is minded into taels or shoes. When troops returned from their participation in the Boxer uprising two decades ago they brought with them quantities of these silver shoes, which were worn for a time as charms.

While there was some interest shown on the part of producers a few months ago in the subject of an export combination the matter seems to have passed from mind. One active producer says: "We are selling all the silver we can produce through banks in New York and are getting good prices. Under the circumstances we fail to see how a combination would be of any assistance."

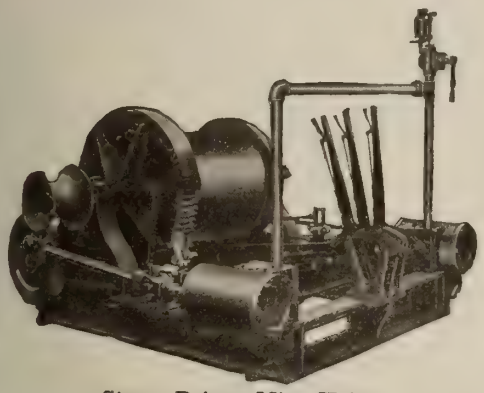
New York producers have sold silver metal this week at $1.23½ an ounce, the highest price reached in over 50 years. For the most part this metal was taken for shipment to China.—Boston News Bureau.

PURCHASE OF FLIN-FLON MINE DENIED.

The Emergency issue of the "Engineering & Mining Journal" states that a denial has been issued by Hayden Stone & Co. of the reported purchase of that mine by interests connected with this well-known Boston and New York firm.



Electrically Operated Mine Hoist.



Steam Driven Mine Hoist.

7 OF OUR MINE HOISTS IN USE BY ONE N.B. MINER 7

and this is not the only firm in Canada using seven of our Hoists.

Would these customers continue to purchase our Hoists from year to year as their business grows without a good reason?

Quality and service count for much more than price in the long run, and while we can assure you that the price of our Hoists is reasonable, the price alone would not have secured us these many repeat orders. These customers were satisfied with the quality of the Hoists, the honest workmanship and material put into the machines, the skill exercised in their design, and their comparative freedom from premature breakdowns or repairs.

Our Mine Hoists are built right, and give the best of service—that is why our customers stay with us, and continue to order more machines as their needs increase.

Choice of 7 sizes in either Electric or Steam Hoists, ranging from 10 H. P. to 50 H. P.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO**

BOLINDER'S Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only ½ cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only $1:—**per hour at full load.**

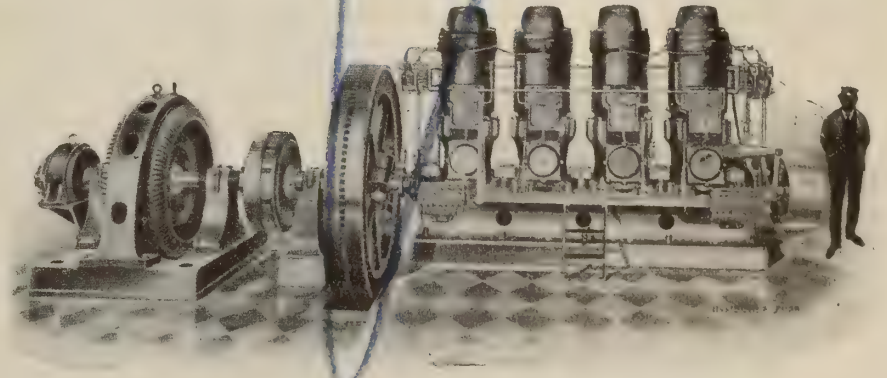
The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

Simple

Reliable

Durable



A 320 B.H.P. Bolinder Engine directly connected with a Generator.

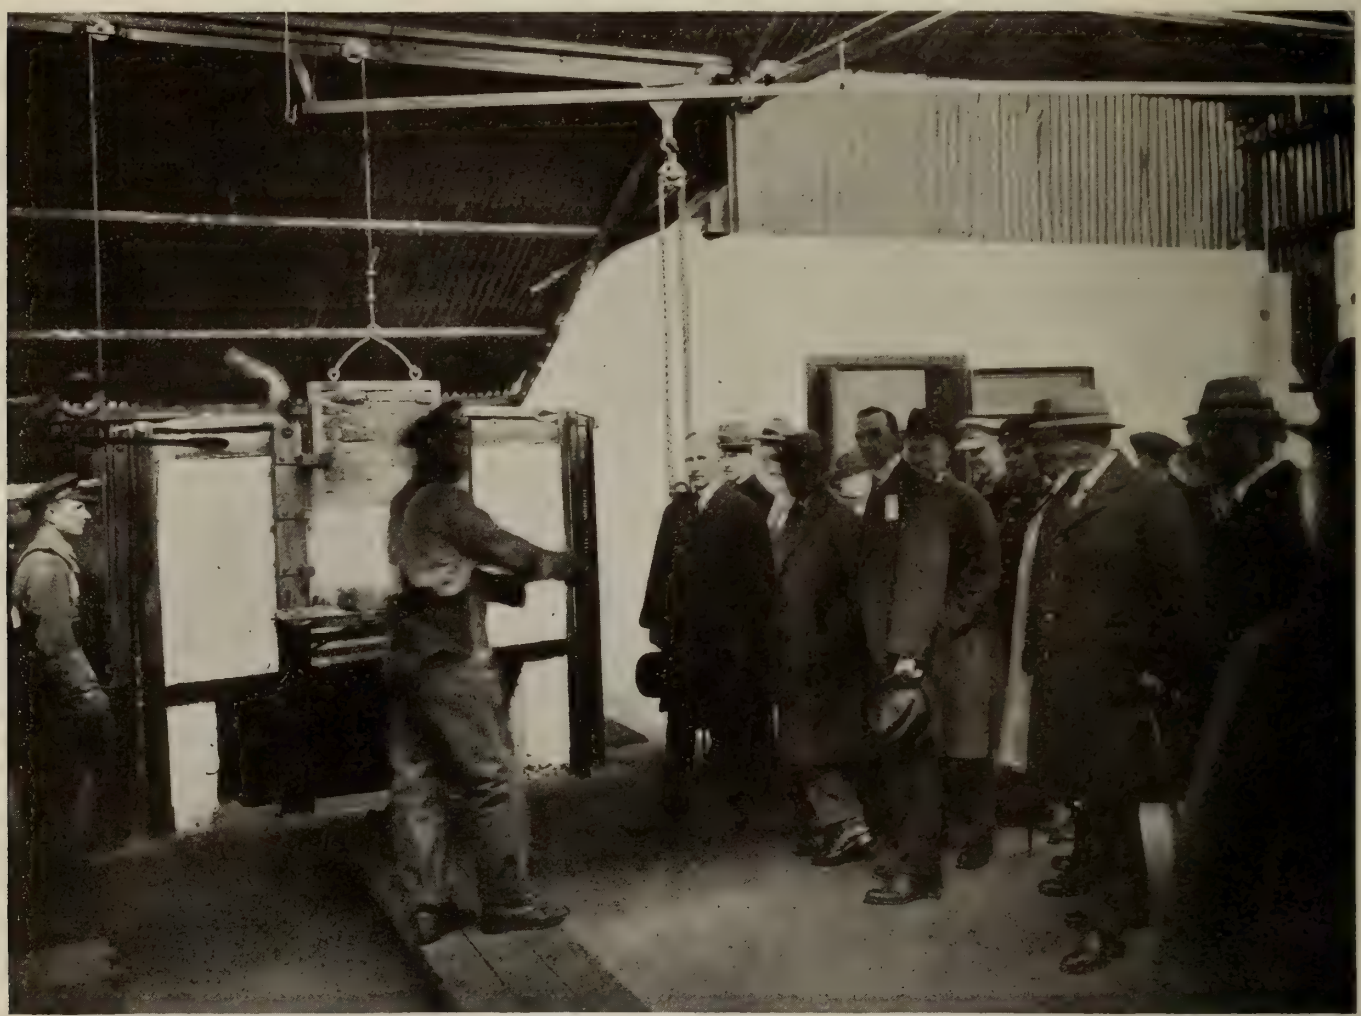
Manitoba Can Manufacture Briquettes.

Hon. T. H. Johnson, attorney-general, has stated that the successful manufacture of briquettes in the lignite fields of southwestern Manitoba is assured and the plan has proven entirely feasible.

In a recent trip to Ottawa Mr. Johnson was shown over the experimental plant of the lignite utilization commission at Ottawa. He says that the commission was proceeding with plans for the erection of a plant which would produce briquettes on a paying basis and would prove the industry to be a good profit-making enterprise. The briquettes, he said, would be placed on the market in the fall of 1920 and would sell for approximately $10. per ton. They were in every way equal to the American anthracite coal. The commission is being financed by the federal government and the provincial governments of Manitoba and Saskatchewan.

The federal officials have been much impressed with the necessity of developing the mineral resources of Manitoba and have given their assurance that surveying for a railway line, from The Pas to the gold belt about 73 miles north of The Pas, will start immediately.

Railway officials, who have visited the fields since the recent big strikes, believe that railway could be operated at a good profit. The provincial government were considering the advisability of erecting a railway, which will cost about $2,000,000 had the federal government refused to take any action.



The Prince witnesses the pouring of silver bullion at the reduction plant of the Mining Corporation, Cobalt.

Manitoba to Have Railway to Northern Gold Fields.

On September 30, after having interviewed Hon. Arthur Meighen, Minister of the Interior; Hon. J. D. Reid, Minister of Railways; and Hon. J. A. Calder, Minister of Immigration, regarding the erection of a railway to the gold fields of Manitoba, Premier T. C. Norris announced that surveying for a railway line will start this Fall.

MINING ENGINEER, Scotch, University and Royal School of Mines, liberal education, 30 years wide general experience, business success, responsible manager German and Spanish mines, underground and large open workings, copper, lead, limonite, lignite, manganese, exceptional knowledge diatomite, expert surveyor, two years successful college lecturer; Mining and Surveying, experienced prospector, reporting, best references for ability and character, excellent health, go anywhere at once, prepared to earn promotion, steady employment with good concern desired.

Address care Mac Intyre 606 B. C. Permanent Building, Victoria, B. C.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PI GMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produ ed in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - HALIFAX, N.S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

Electrification of the Canadian National Railway in Nova Scotia

The question of the electrification of a portion of the Canadian National Railway in Nova Scotia is raised in this issue by Mr. C. H. McL. Burns of the Maritime Coal, Railway & Power Co. The same question was rather fully discussed at the annual meeting of the Mining Society of Nova Scotia in 1917 and again in 1918, and while there was some hesitancy on the part of the coal men present, because of a possible diminuation of the quantity of coal required to operate the railway under electrification, there was very general agreement that not only was electric operation possible, but that it was desirable.

Mr. Burns's article points out that electric power may be generated from the slacks and inferior coals, which are, if not exactly a by-product of coal-mining, yet products that are not easily saleable and are unable to stand the cost of any long distance of rail haulage. This is in fact the method which the coal companies in Nova Scotia are using to supply the power required to operate the collieries. The Dominion Coal Company, in particular, has developed the application of electric drive to most of the operations at its collieries, distributed over a very wide radius, and is used dust-fired boilers with success. In fact, very little fuel of first-class commercial grade is now being used at Nova Scotian collieries, and the practice pursued at the collieries for a number of years has demonstrated not only the convenience and efficiency of electric power, but the economies arising from the generation of electricity in central power-stations with the use of low-grade fuels.

The question of grades is a serious one between Truro and Moncton. The adaptability of the electric locomotive to heavy grades is generally admitted and the President of one railway in the Western States has stated that the electric locomotive had enabled them to forget the continental divide.

As Mr. Burns mentions, the water-powers of the Maritime Provinces do not hold out much hope of generating large quantities of cheap electricity, and coal must always be the source of whatever motive power is used on the eastern railways, to a very large extent.

Those who favour electrification of the National Railways in Nova Scotia would electrify the whole of the road from Sydney to Moncton at least.

It is pointed out that main generating stations could be placed along the line of railway to take advantage of the main coalfields of Sydney District, Inverness (by a station at the Strait of Canso), Pictou, and Cumberland County, including the extension of the Cumberland field into New Brunswick.

It is also thought that, by a system of light electric railways, feeding lines could be used to open up the districts of Nova Scotia which are today undeveloped, and must remain undeveloped until transportation is provided.

The question raised by Mr. Burns is one that we have by no means heard the last of in the Maritime Provinces. Nova Scotia's long sea frontage, her excellent harbours, and the natural position of the main centres of population on these harbours, has for a long time obscured the lack of proper transportation in the interior, a lack that extends both to highways and railways.

Considering that Nova Scotia has for a century been mining and exporting coal, that Cape Breton coal was used in the fireplaces of both Boston and New York before it was known that anthracite would burn, it is surprising how long the people of that province have endured the limited use that has been made of electricity and coal-gas. In the Sydney coalfield, the richest bituminous coal area in Canada east of Alberta, where hundreds of thousands of tons of coal are annually subjected to destructive distillation for the manufacture of coke, no such convenience as a gas stove is to be found. Not a single industry (beyond the basic industries of coal-mining and steel manufacture) is to be found in the Island of Cape Breton attracted there and having its manufacturing costs based on cheap power. This is something that can be said of no other coalfield of like length of development, and is certainly something to be thought over. Exactly the same may be said of the Pictou, Inverness and Cumberland coalfields—modified to a small extent in relation to the vicinity of New Glasgow.

The coal mined in Nova Scotia has for generations gone to provide the driving power for the industries of New England, Quebec and Ontario, and has, in large part, been followed by the youth and energy of the Province. Mr. Burns's proposal has a wider application that he has used, and it is probably unnecessary to excuse this amplification of a subject that must always bulk largely in the thought of those who have seriously considered the stationary, if not retrograde position of Nova Scotia, when compared with the other provinces of Canada.

Problems of the Maritime Provinces

At the recent meeting of the Maritime Board of Trade which was convened in Moncton a broader and more united spirit is stated to have prevailed than at any previous session. There was absolute unanimity of opinion on the advantages of Maritime Union, the necessity for the division of the Canadian National Railway into units, with a Maritime Province unit from Montreal or Quebec, and the necessity for a thorough geological re-survey of the Maritime Provinces.

The Province of Nova Scotia has been fairly well mapped geologically, but the maps badly need revision. New Brunswick is in large measure a terra incognito from a geological standpoint, largely of course because of the dense forest still covering a large part of that province. While more is known of the coal occurrences of Nova Scotia than is known of other mineral deposits of that Province, yet it cannot be said that any notable addition to our knowledge of the maritime coalfield has been made in the life of the present generation, or since the untimely death of Hugh Fletcher. The maritime coalfield includes the well-known seams of Sydney, Inverness, Pictou, Cumberland and Joggins, and the lesser known occurrences of New Brunswick and Newfoundland, with the possibility of concealed coalfields in Cumberland County and under the Permian cover of Prince Edward Island, and possibly also under the waters of the Bras d'Or Lake. The labours of many eminent geologists, from Sir J. W. Dawson and Abram Gesner down to the work done by Dr. A. O. Hayes and reported in the Summary Report of the Geological Survey for 1918, have been expended on the mapping and stratigraphical position of the maritime coalfield, but the problem has never been conceived as a whole, and no application of the newer developments of what may be termed "coal geology" has been made to the ascertained facts of this coalfield, which is essentially a single deposit covering roughly a parallelogram 200 by 300 miles in extent, having at its four corners the mouth of Chaleur Bay in the west; Fredericton, New Brunswick in the south, Arichat, Cape Breton, in the east; and the head of St. George's Bay, Newfoundland. in the north.

The configuration of the pre-Carboniferous rocks on which the Coal Measures were laid down, the subsequent earth movements, and the co-relation of the separated basins of the original coalfield, are matters worthy of the concentrated lifestudy of a competent geologist, but no geologist has as yet been able, or willing, to tackle this great and worthy task in the same way that Prof. Lapworth and Prof. Kendall worked at the problem of the concealed coalfields of England.

Even the lesser problem of co-relation of the seams within the known sub-divisions of the main coalfield has not been attempted, and, with all the added knowledge since his day, with all that we have learned through microscopic examination of coal sections, and of the persistence of maritime or fresh-water shell horizons associated with coal-seams, no one has made a better guess at the co-relation of the coal-seams in the several basins of the Sydney coalfield than did Richard Brown in 1865.

In Newfoundland, the situation is even more backward. Statements are made by responsible ministers of Newfoundland regarding the existence of large coal deposits in that country, but the exact geologic ascertainment of the basis for such statements is lacking, because Newfoundland has never been geologically surveyed as that term is understood today.

Whether political union of the Maritime Provinces should include Newfoundland is for Newfoundland alone to say. But from the standpoint of geological science, Newfoundland should be included in any systematic re-survey of the Maritime Provinces.

The Maritime Board of Trade is to be congratulated on its broader vision. It is on the right track. The undeveloped Maritime Provinces — for undeveloped they certainly are—cannot stand against the growing population and infinitely greater acreages and natural resources of the western provinces if they persist in disunity and unnecessary expenditures on administration.

We do not know whether the Maritime Board of Trade discussed another problem of the Maritime Provinces, namely, the need for a unified and enlarged measure of technical education. The dissipation of energy in educational problems in these provinces is not less marked, nor less detrimental, than the archaic and almost laughable spectacle of three full-fledged administrations, with upper and lower houses, speakers, lieutenant-governors and all the paraphenalia of government in a territory that nature and art and horse-sense indicate should be one and undivided.

LE PRINCE CONQUERANT.

The Prince of Wales was mentioned in despatches as having efficiently performed the duties of a liaison officer between French and British forces in the war. His ability has been demonstrated with no less distinction in the Province of Quebec, where he will be affectionately remembered as the liaison officer of racial concord and as **le prince conquérant.**

Should the Government Electrify the C.N.R. From Moncton to Halifax?

By C. H. Mc.L. BURNS.

The electrification of railways has been discussed so often by eminent electrical engineers and prominent railroad men during the past year, and the advantages and disadvantages compared with steam operation have been advanced so often in our leading trade journals and professional publications that it would be little short of presumption for me to attempt to arrive at any decision on the subject. Nevertheless, I wish to draw attention to the advantages which the electrification of the Canadian Government Railways from Moncton to Halifax might yield to the operators of the thin coal beds of the Cumberland district, and incidentally place before the public notice the opportunity which this step would present to conserve the coal resources of the Province.

The engineering phase of this question is an established possibility, beyond all doubt. It is no longer an experiment. The equipment is commercial. All that is required is the power and the money to develop it; the last annual report of the Norfolk and Western Railway testifies to this. The Commission of Conservation, in their ninth annual report, sums the situation up as follows:

"Balancing the pros and cons, it is found that elec-"tric traction materially reduces the operating ex-"penses, but materially increases the fixed charges. "The saving in operating expenses is nearly directly in "proportion to the number of trains per day. The "greater the density of traffic the greater the sav-"ing. The cost of installation is in a great measure "independent of the density of the traffic, or the num-"ber of trains per day. On a road of a given standard, "the cost of many of the items which go to make up "the whole is the same whether the trains be few or "many. The problem thus always resolves itself into "this. With the number of trains per day on a given "section of a road, will the undoubted savings and "operating expenses be sufficient to offset the un-"doubted increase in fixed charges?

"Every division of the road is a separate and inde-"pendent problem."

No doubt generalization is dangerous, especially in connection with the electrification of railways, where so many factors, such as the physical location, character of loads, the power situation, etc., come in to affect the decision if applied locally. But applying it locally the question is this—is the traffic on the Moncton-Halifax divisions sufficiently dense to justify the large expense necessary to the installation of electric traction? Probably under war conditions it was, and possibly facilities for handling might make it so under normal conditions. Halifax is one of the world's greatest ports. In fact it is rivalled by few in the shipping world. On this Continent it is the nearest port to Great Britain and France and should be the gateway to the whole Dominion. The average freighter can save eight days on a return trip across the Atlantic, sailing from Halifax, instead of from Portland, Boston or New York, and about four days over St. John. This fact was of the greatest importance during the war when bottoms were at such a premium, for it meant that a boat on the Halifax route could carry from one quarter to one third more men, food, ammunition and supplies, than can the same boat from any of the American ports. If Halifax can discharge and load that boat with greater efficiency and speed than any other port, it means a still greater saving over the others. But railway transportation and port facilities govern the degree to which this geographical advantage can be utilized, and it goes without saying that with equal facilities for handling and equal port charges, the port with the widest choice of transportation facilities to the interior will be the greatest. New York has grown by leaps and bounds beyond all other ports on this side of the Atlantic because of this universality of railway connection. It competes with Montreal and New Orleans for the freight that should come to them as the natural outlets for the country back of them. The fight for this trade started back in the days of inland water transportation when the Americans built the Erie Canal to divert the Western trade from the Montreal route. Canada tried to come back with the Trent Canal but was forestalled again by the advent of the American Railway. Are we still going to be satisfied with a second place? Why cannot Halifax and not New York handle the flow of grain from the West while Montreal is frozen up? The reason is quite evident. Railway congestion and lack of facilities for storing is driving this traffic into other channels. This is a very serious problem now, but even after this war is settled, when the struggle for the markets of the world will be fierce, any practical expense due to transportation will act as an increased cost of production on our goods. The port problem is important, but it is a railway problem even more than a shipping one. Halifax now has the terminal docks, which will doubtless be equipped with the best facilities for discharging and loading ships in port, but if it is not to be strangled, it must have adequate transportation facilities. The Intercolonial, the National Transcontinental and the C.P.R., all converge to pour the freight of Canada into Moncton, but from here to Halifax this freight must be hauled 186 miles over a single track railway. This 186 miles must be double tracked and some day electrified or electrified now as a more speedy remedy. As to double-tracking the "Canadian Engineer" in an editorial of April 18th, 1918, says:

> "The railways to the American ports are heavily congested. The whole shipping problem on the Atlantic coast would be materially relieved by widening the neck of the Halifax bottle. As to electrification as an alternative, Mr. E. W. Rice, the President of the American Institute of Electrical Engineers, in an address to that body in New York not long ago said: 'I think we can demonstrate that there is no other way known to us by which the railway problem facing the country can be as quickly and as cheaply solved as by electrification.'"

From the foregoing it seems at least reasonable to

* Resident Engineer, Martime Coal Ry. & Power Co., Joggins Mines, N.S.

conclude that the electrification of this section of the Government Railways is justifiable in view of the energetic trade war and keen competition for a share in the world's markets, which will doubtless follow the Great War, as a permanent investment in the commercial life of our country purely from a transportation point of view. Further, and which I wish particularly to point out is the importance of such an undertaking in the conservation of the fuel resources of the Maritime Provinces, which are vital to the commercial and industrial life of the Dominion as a whole.

One of the great advantages claimed for electrification is the saving in coal, when burned in one large, central power plant in comparison with burning it in an inefficient locomotive. But electrification offers this and still greater advantages in the economy of coal through the medium of the central station. When this section of the Government Railways is to be electrified it must be by steam power. A glance at the map will illustrate this. The streams flowing through this part of New Brunswick and Nova Scotia are all short and their watersheds small. Hydro-electric development on a large scale cannot be undertaken between Moncton and Truro at any rate. But if the country has no water power great enough for an enterprise of this magnitude it has unlimited coal resources. The Cumberland Coal field, one of the largest in Nova Scotia, is situated at almost the centre of the Moncton-Truro division, and if the coal is properly conserved, it offers a supply of power more than sufficiently large for such an undertaking, for a great many years to come, probably hundreds of years. Here is another advantage for the central power station. Situated in the centre of the coal field, it will greatly reduce the cost of coal at the plant; power is now being generated by some of the coal companies for at least half a cent per kilowatt hour. This central power station could also distribute power to the industrial centers scattered along the railways, and contiguous thereto. This would eliminate the need for transporting coal to them and give them their necessary power with a much smaller coal consumption, a relief to the overburdened railway, and another step toward true conservation.

In the Cumberland Coal Field there are two areas of productive coal measures, separated by a large tract of newer rocks. One of these is the Springhill area, situated almost in the centre of the country and immediately north of the Cobequid range of mountains. It has an area of approximately 21 sq. miles and is connected with the port of Parrsboro and the main-line of the C.N.R., at Springhill Junction by rail.

The other productive area is the Joggins. It extends from the shores of Chignecto Bay inland some twenty miles to the old Economy Road. Between seventy and eighty seams of coal outcrop along the northern side of a cylindrical basin of carboniferous measures, the axis of which pass through Shulee, about twelve miles south of Joggins, on an east and west direction. The seams dip to the south under newer strata at angles varying from 17 degrees at Joggins to about 50 degrees on the eastern end of the area. The width of the area across the outcrops of the productive strata is about two miles, but as mentioned before, the seams all extend southerly under the newer rocks giving the basin a much greater width. The main line of the C.N.R., between Maccan Junction and Athol, crosses this area about midway between its extreme ends and taps the area on either side by the Joggins Railway on the west and the Chignecto and Fenwick lines on the east.

This Joggins field is unique in comparison with the other coal fields of the province. As they are noted for their thick seams this field is noted for the very large number of thin seams which it possesses. Of the eighty seams exposed only five or six are considered workable at a profit. These range from 2½ to 4 ft. in thickness. Nevertheless, a conservative estimate of the amount of coal in these six seams, as far as they have already been proved, is several billion tons.

Although this field was probably the first in America to be investigated, being mentioned in the "Relations of the Jesuits" as early as 1612, it has not grown in importance as have the other fields of the Province, due alone to the thinness of its seams. When pressed by the Government of Nova Scotia in the early fifties, to do more work on their areas in this district. the old General Mining Assocation complained that they had spent over a hundred thousand dollars and had not realized forty-five thousand. The mistake was that they were trying to apply the same methods of mining to these thin seams that had proved a success in much thicker seams. One company followed another with but indifferent success. None of the mining was deep, one slope after another being opened along the outcrop; long underground hauls with the equipment which they had made the cost of production prohibitive. The result is that this large field has only been scratched along the surface. But in late years the Maritime Coal, Railway & Power Company has come into this field and been pioneers in the profitable working of these thin seams. They now control large areas and by the introduction of machine longwall working, mechanical haulage, underground and universal electrical equipment throughout its mines and surface plants, has succeeded in bringing the cost of production appreciably below the market price of coal. They have proved that with proper methods of working and the economical handling of large outputs, the thin seam can compete favorably with the thick one. There is one drawback, which as yet has not been overcome. The coal has to be "mined" and since the mining is approximately the same for any seam, the percentage of fine coal is much higher in the thin seam than in the thick one, which of course is always harder to market than round coal.

In the early days of coal mining in Cape Breton and before the advent of the steel industry, the disposal of this fine coal became a serious problem, so much so, that at one time it was seriously advocated to use it on the sea beach to evaporate sea water in the production of salt. Now, however, their larger markets and the steel industry absorb it all.

Unfortunately the coal of the Joggins field is not a good coking coal and the fine coal cannot be used for metallurgical purposes. This however is a very strong argument for encouraging the working of these thin seams for steaming purposes now and conserve the large beds of good metallurgical coal to supply the demands of the future. The idea advanced heretofore has been to work the thick beds now at a profit and fall back on the thin ones as a matter of necessity when prices will be higher. This is human nature, but is it sound common sense? If the industrial life of Nova Scotia, which is part of the Dominion is to continue permanently, the coal industry must be maintained for as long a period as possible, and to accomplish this, the thin beds should be worked contemporaneously with the larger beds.

To profitably work these thin seams then, some market must be found for the fine coal, which in a great many cases runs as high as fifty per cent of the

output. Evidently, the only market accessible is for steam purposes. The most obvious method of utilizing a particularily small fuel is to burn it. Here again we strike a snag. Most of the individual steam plants, scattered over the country, and locomotives, are not equipped to economically use fine coal. To do so requires a study of the fuel and furnace designed for it. This, of course, could not be attempted by the plant using a few cars of coal a year. It must be done by the coal operator if he is to dispose of his coal. The only solution of the problem then, seems to be for him to erect and equip such a plant and turn this unmarketable fine coal into a marketable product in the form of electricity.

The Maritime Coal, Railway and Power Company, mentioned before, has taken the first step towards marketing their fine coal as electricity, in fact, they claim to be the first in America to supply power for commercial purposes, direct from the waste coal at the mouth of the pit. On the suggestion of Thomas A. Edison, they erected as an experiment a small power plant at their Chignecto Mine, six miles from the town of Amherst; the experiment has proved a success and the capacity of the plant has been increased gradually until now it supplies practically all the power used by the industries of that town, light for the town, light and power to the Company's mines throughout the district, as well as supplying the country situated along its power lines. But the extent to which the plant will relieve the situation is dependent on the market; that, at present, is not large enough to enable this one company to dispose of all its fine coal. True a power plant can, to some extent, create its own market by offering power at an attractive price and so induce industries to locate in the district, but, in order to make its price attractive it must be efficient, and therefore necessarily of large capacity. Further, to find money for such a venture, the market must be reasonably sure, or in other words market and plant must grow together.

Here is a coal field with an abundance of fuel, and the nucleus of a large power plant, already in operation, on the main line of the C.N.R., from Moncton to Halifax. Why cannot the Government kill two birds with one stone—solve its transportation problem by electrifying and offer the coal operator a market for his fine coal? Why increase mine production and overburden the railway carrying this coal around, depleting our coal fields more rapidly than necessary, when we can conserve the round coal by burning the fine?

IRON AND MANGANESE ORE DEPOSITS IN THE IDARWALD, GERMANY.

(From the British Military Governor, Cologne.)

For the last few months prospecting for iron and manganese has been taking place in the Idarwald, about 50 kilometres south of Coblentz. It was known before the war that there were deposits of iron ore in this region, but with the Lorraine Ironfields in their possession, the Germans did not consider the exploitation of the ore deposits in the Idarwald profitable enough.

The work of the last few months, however, has given very satisfactory results, and it appears that the whole of the Idarwald contains rich ore deposits. Deposits have already been discovered in the regions of Rhaunen-Sulzbach, Weitersbach, and Horbruch (about 20 kilometres W. by S. of Berncastel).

The ore has been discovered at a depth of from 6 to 10 ft., but in several places also just below the surface. Analysis shows that it contains from 55 to 60 per cent metal, and up to 30 per cent manganese. Its transport could be effected at a small cost by means of the Hunsbruck railway.

THE UNITED VERDE COPPER COMPANY, JEROME, ARIZONA.

From an article in the Tucson "Citizen," republished in "Iron Ore" of Ishpeming, Mich., the following particulars regarding the operations of the United Verde Copper Company are extracted.

For stripping the overburden a steam shovel weighing 300 tons is used. The dipper holds eight cubic yards, or rather more than ten tons, and the radius of the shovel's operation will permit of opening up a cut 140 feet wide. This shovel is shifting 175,000 yds. of rock monthly.

At the United Verde smelter at Clarkdale, a powdered coal plant is being finished. This plant will have a capacity of 500 tons of pulverized coal per day and will supply fuel to five reverbatory furnaces.

A coal storage and reclaiming plant has recently been completed. It will store 14,000 tons of coal, 12,000 tons of which can be stored under water. When the stored coal is required it is conveyed from the water-bunkers to the drying plant by a belt conveyor, and after drying, by a system of screw conveyors, the coal is taken to the pulverizers where it is ground to 200 mesh. It is expected that the use of powdered coal will show an economy over fuel oil now used.

A Cottrell smoke treater is approaching completion. The plans of the company contemplate an expenditure of a million dollars on treatment of the fumes, dust collection and recovery of copper which now goes to waste in the dust.

Large use is being made of concrete in the underground work. A stretch of tunnel reaching from the portal for 3,600 feet in the main tunnel has been treated with a concrete gun. Another tunnel section 950 feet in length is being entirely concreted because of the nature of the ground.

Especial attention is being devoted to the well-being and comfort of the employees.

PERSONALS.

Mr. Jas. McEvoy has returned to Toronto after examing iron deposits in the Belcher Islands, James Bay. He made the trip north in 15 days and the return trip in 20 days. He was accompanied by Mr. Sainsbury, one of the owners of the properties.

Mr. J. B. Tyrrell who has been examining gold properties in Rice Lake district, Manitoba, has been detained by the early freeze up.

Dr. W. G. Miller, Canada's representative on the board of the Imperial Mineral Resources Bureau, has returned to Toronto after several months' absence in connection with the work of the Bureau.

Mr. R. E. Hore has returned to Toronto after examining properties in the Shiningtree gold district and will leave shortly to make an examination in the Rice Lake gold district, Manitoba.

Some Elements of Economy in Air Compression

By WM. CARTER, A.M., A.S.M.E.

(Continued from page 809, issue of October 29th.)

But even under the best conditions water jacketing realizes only a part of the saving which its theory promises. Some beneficial effect in this respect it certainly has, particularly in slow speed, long-stroke machines. But probably its greatest value lies in its effect upon the lubrication and the resultant wearing qualities of the machine. Compression at sea level and ordinary atmospheric temperature to only 75 lbs. gage produces a temperature of about 400 degrees Fahr. If some means were not employed to reduce this temperature, the inevitable result would be destruction of all ordinary lubricants and packings, and the rapid wear of piston rings, cylinders, rods and valves, with extravagant leakage, loss of capacity, increased friction and excessive power consumption. But the water jacket keeps all parts reasonably cool and results in tight joints, free lubrication, little wear, reduced friction, easy running, and sustained capacity and efficiency.

It is perhaps unnecessary to say that it is almost as important that air should be admitted into the cylinder cool as that it should be kept cool during compression. If a water jacket were not used the entering air would be heated while passing through the hot valves and ports and by contact with the heated interior of the cylinder. This would mean the rarification of the intake air, reduced cylinder capacity, lower efficiency of compression and excessive terminal temperature. Since jacketing is at the best only partially effective, this latter argument suggests the advantage of those constructions which admit air through one or at least only a few large openings where only the outer film of the air is heated rather than through a number of smaller openings through which the air is finely sub-divided and heated.

The second process of cooling—compression in stages—is analagous to an arrangement in which the compressing piston of a single cylinder is stopped at intervals through its stroke and the partially compressed and heated air is withdrawn and cooled by some external means to its initial temperature or even lower; then returned to the cylinder to be further compressed, heated and cooled until the desired pressure is reached. It is evident that such an arrangement would maintain a fairly uniform low temperature in the air volume throughout the stroke, giving very close to isothermal compression.

Such a proceeding is evidently not practical. But the same results may be obtained by compressing in several cylinders, in the first of which moderate pressure and temperature are reached and the air in this condition discharged through a cooling device which restores its initial temperature; then admitted to another cylinder for further compression and heating; again withdrawn and cooled and again compressed. This is a stage or compound compression. An average of the practice of the leading builders permits single stage compression for pressures up to 70 pounds or under some conditions to 100 pounds; two stage compression for pressures of 75 to 500 lbs., three or four stage (preferably in duplex compressors) for pressures of 500 to 1,500 lbs., and four stage compression for pressures from 1,500 lbs. up.

A three stage straight line machine should only be used for small or moderate capacities. Above this, the duplex type should be preferred because of its balanced construction and of the readiness with which it is compounded.

The primary object of compound compression is a saving of the power required by what may be called the heat element in compression. The degree to which this is accomplished depends entirely upon the efficiency of the intercooler. The ideal intercooler would be one which would reduce the temperature of the air to the temperature of the cooling water. This probably cannot be realized, but a good practical standard demands that the intercooler shall deliver air at a temperature not more than ten degrees above that of the cooling water.

The successful intercooler involves six fundamental requirements. It must provide for a complete and minute subdivision of the air passing through it, that the heat may be dissipated without any dependence upon the best-conducting qualities of the air itself. The air should be split up into thin sheets or streams so as to dissipate its internal heat. There must be an ample cooling surface presented to this subdivided air stream. The circulation of the cooling water must be properly directed in relation to the flow of the air, and its velocity must be such that the maximum amount of heat will be carried away without waste of water. All air passages must have ample cross section, that the velocity of air may be such as to give a length of contact with the cooling surfaces sufficient for the complete removal of the heat. Expansion and contraction must be provided for that there will not be a leakage of air or of water. Suitable means must be provided for removing from the intercooler the moisture condensed from the air in the cooling process.

Compound air compression has important bearings upon other features of compression economy. It reduces the average structural stresses, resulting in a higher factor of safety and a longer life for the machine with a given weight of metal. The maximum stresses encountered in compression in two stages are only 55 or 60 per cent of what they are in single stage compression to the same pressure. The reduction of stresses here referred to is felt not only in the machine structure but in the air valves, which show a notably easy operation under compound conditions. Another advantage of compound compression is an improved steam economy if the compressor is steam driven. The averaging of the stresses throughout the stroke, permits the work to be done with a lower M.E.P. in the steam cylinder, which means a shorter cut-off and a greater steam economy. The reduced terminal stresses permit a higher piston speed with safety, thus improving the steam economy by reducing condensation losses and leakage in the steam cylinder.

Higher volumetric efficiency results from compound compression, coming from three sources. The first of these is the fact that the clearance pressure in the intake cylinder is lower. The second is a lower maximum temperature in the cylinders so that the entering air is not so much heated. The third is a reduction of leakage consequent upon the reduced extremes of pressure in each cylinder. Compound compression results in more efficient lubrication of the machine be-

cause of the lower temperatures involved. This means easier running, improved mechanical efficiency, less wear, lower repair costs, reduced leakage losses, and longer life. Compression in stages results in the delivery of drier air—a feature of great importance where the air is used under conditions which may result in freezing up at the exhaust ports. This also largely obviates the accumulation of water in pipe lines.

The air valves of a compressor are probably the most vital parts of a machine. While the number of different types of air valves is greater than the number of compressor builders, yet they may be broadly classified into two groups. Mechanically actuated valves have a positive motion derived through some mechanical connection from the rotating or reciprocating parts of the compressor. Poppet or automatic valves are operated wholly by differences of pressure. There are some air valves in use today which cannot be exactly placed in either class. Notable among these is the "Hurricane-inlet" or "Piston-inlet" of one of the large builders which is operated by its own inertia. In other cases a valve may seem to combine the features of both classes, an automatic adjustability supplementing a primary mechanical control.

Without going into a detailed discussion of the many different types of air inlet valves, some general observations may be made as to their function and requirements. The function of an inlet valve is to admit the maximum volume of cool, clean air to the cylinder with the least expenditure of power; to keep this air in; and to continue to perform this duty indefinitely at the least total cost. Analysis of this function reveals the following requirements of the successful inlet valve.

It must admit a volume of air which will entirely fill the cylinder, this air being as nearly as possible at atmospheric pressure. This calls for an instantaneous and complete opening of the valve, so timed that there shall be no escape of the compressed air in the clearance space. This full opening should be held to the end of the stroke, and short, direct and unobstructed passages should be provided through ports and valves.

It must admit clean air, suggesting a design permitting ready connection to an intake passage or conduit leading to a place free from dust and grit. The air admitted must be as cool as possible—a condition partially met by the consideration just mentioned by which cool air as well as clean air should be supplied. But, more than this, the cool air supplied should nowhere be heated in its course into the cylinder, suggesting that valves, ports and passages shall be so placed as to be cooled by the cylinder jacket. Moreover the air should be admitted through one or a few large openings rather than sieved through many small ones.

All the air admitted must be kept in the cylinder, calling for instantaneous and complete closing of the valve at the end of the stroke, with a perfect seating and without any leakage. All the processes outlined here must be carried on with the least possible expenditure of power for the overcoming of friction and the manipulation of the valve gear—a requisite demanding nice adjustment, simplicity of mechanism, perfect lubrication and as few wearing surfaces as possible. This exacting performance must be continued indefinitely, twice each revolution and hundreds of times per minute without undue wear or loss of adjustment. This condition is fundamentally one of correct design, high class materials and workmanship, and generous lubrication.

The ideal inlet valve is here outlined. Probably no compressor valve on the market today exactly fulfills all of these conditions; but many types represent the experienced judgment of the builders applied in an excellent compromise.

The functions of an air discharge valve are to release the full volume of compressed air from the cylinder with the least friction and power expenditure; to keep it all out after discharge, and to continue indefinitely to maintain this duty without undue expense. The primary essentials of such a valve are as follows:

Its opening must be full and instantaneous, must occur just at the right point in the stroke and must be held until the piston comes to rest. The valve opening must be ample so that the velocity of discharge may not be excessive and the ports and discharge passages should be short and free from obstruction, to reduce friction.

As few parts as possible, and these correctly adjusted, should provide for the necessary valve movement with the minimum loss of power in mechanical friction.

The valve should close instantly and completely as soon as the piston stops, that there may be no return of the air discharged when the piston starts on its back stroke. Such a return of compressed air would have the effect of an increased clearance, reducing the capacity of the cylinder.

The continued maintenance of this performance (which is more arduous upon the discharge valves than upon the inlet valves because of the higher pressures) suggests the advisability of a simple construction with the fewest bearings, careful workmanship, the use of good materials, perfect lubrication and careful distribution of materials. It is always to be remembered that discharge valves and ports are continually exposed to a flow of heated air even where jacketing is most complete. On the other hand, an essential of inlet valves and ports is that they shall be kept cool. The latter should therefore be removed as far as possible from the former, nor should the same ports be used for both inlet and outlet.

It might at first glance, seem that the area of the discharge valves, ports and passages could be much less than the corresponding inlet area, since the former must pass the air at a higher pressure and in less volume than the latter. But it is to be remembered that while the inlet areas are open during the full stroke, the discharge areas are open for only a part of the stroke—about one-third. In order, therefore, to make the velocity of discharge about the same as that of intake or admission, it is usual to make the inlet and discharge areas approximately equal.

It is important that the velocity of flow through the valves, ports and passages shall be not excessive, and this depends upon the piston speed which is a widely variable quantity. The higher the piston speed, the larger should be the area. In actual practice, the inlet areas vary from 3 to 15 per cent of the cylinder areas, with an average probably around 9 to 10 per cent. The corresponding discharge areas from 7 to 15 per cent, with an average in the neighborhood of 10 to 12 per cent. The larger these areas, the better the economy.

Owing to the increased friction through a number of small passages as compared with that through a single

large one, the actual measured area in the former case should be 50 to 100 per cent larger than the latter. This explains why the measured inlet area of machines with Corliss or other large area inlet valves is often so much less than the measured discharge area of many small poppet discharge valves, while still giving good results.

It may we well to recall at this point that cylinder clearance is really made up of three elements: the inlet port clearance, which is all the space left between the closed inlet valves and the inner surface of the cylinder, the discharge port clearance, which is the corresponding space in the discharge passage, and the piston clearance, which is the space allowed for safety between piston and cylinder head at the end of the stroke. This latter element is an essential in compressors. But it is not unusual for the other two elements together to constitute by far the larger proportion of the total clearance. This suggests the superiority of those valve designs in which inlet and discharge port clearance are reduced to the lowest practical limit.

Coming now to consideration of the third element in air compression, the mechanical structure, we find that it has a very important bearing upon the economy and the endurance of the machine.

The mechanical efficiency of a compressor can be exactly determined by a comparison of the steam and air indicator cards (in a steam driven machine) or by a comparison of the measured power applied to the horse power of the air indicator card (in a power driven machine). The difference between these values represents the power consumed in the fricton of the compressor. Good mechanical efficiency, therefore, depends upon the extent to which friction is reduced. There is no time here to enter into the details of compressor design, it will be enough to enumerate some points having a vital bearing on this subject.

Power should be applied to resistance—steam pressure to air pressure—in as direct a manner as possible, so that bending or deflecting strains may be avoided as far as possible, with the resultant binding of bearings and loss of correct alignment.

Ample metal should be used, properly disposed to afford the rigidity necessary as a further precaution against the attendant binding stresses just mentioned. A light construction is always to be avoided.

Lest this correct proportioning of materials to meet stresses should result in an excessive weight and an extravagant cost, these materials should be of the best quality and intelligently selected for specific purposes, affording the maximum strength per unit of weight.

All bearings should be of ample area, so proportioned as to give a safe, moderate pressure per inch of bearing surface.

Wherever possible, bearings should be supplied with removable linings (preferably of anti-friction metal). In all cases, whether thus lined or otherwise, they should be scraped smooth and true, properly adjusted and arranged for the ready distribution of lubricant—all of this tending toward a lower coefficient of friction for these bearing surfaces.

Complete provision should be made for a plentiful supply of lubricant to all bearing surfaces, furnished preferably by an automatic system which will be efficient at all speeds.

The utmost simplicity should be sought throughout, reducing the number of parts, the number of joints, (each an element of weakness) and the number of bearings, with their attendent friction and their possible loss of economical adjustment.

The design should afford a ready accessibility at every point, inviting frequent and careful attention to the maintaining of a correct adjustment of all parts for most efficient operation.

Steam compounding and compound air compression have important effects upon the mechanical efficiency, which have already been discussed in the proper place.

Friction has been aptly defined as "that portion of the power consumed by a machine in wearing itself out." This definition throws on the question of compressor endurance a light in which the importance of a high mechanical efficiency appears in bold relief. True economy is a question, not of momentary results, but of results covering months and years of continuous service under all conditions: and a compressor in which the percentage of "wearing out power" is least promises not only the highest, but also the longest, record of sustained economy and satisfactory service.

While the regulating devices or governors used on air compressors vary in detail among the different builders, all may be divided so far as the principle of operation is concerned, into two classes.

The first class is that applied to compressors with plain or adjustable cut-off valves of flat or piston type. It operates by throttling the steam supply as load diminishes. Devices in this class consist fundamentally of a valve in the steam pipe, which is opened or closed by action of a piston in a cylinder, this piston being actuated by air pressure from the receiver. The movement of this piston is opposed by weights on a lever or by a spring, and the spring tension or the weights may be adjusted so that the governor valve is full open at any desired normal air pressure. But when pressure exceeds this limit, the tension of weight is overcome, and the valve in the steam supply is closed in a degree corresponding with the amount of excess pressure. This slows down the machine and reduces the volumne of air discharged until such time as the normal pressure is reached, when the weights or spring tension again open the governor valve, and full speed is restored.

The second class includes governors applied to machines with Corliss steam valves. The mechanism consists of a pressure cylinder and piston with opposing weights or springs as described in the preceding paragraph, but in this case the movement of the governor, instead of throttling the steam, changes the cut-off of the steam valves, reducing speed under partial load, and restoring it as load increases. The resistance per stroke being the same throughout a very slight change of cut-off hardly effecting the economy, produces all the speed change necessary.

Both of these classes of governors include also a speed-limiting device, the more common form being the familiar fly-ball arrangement, which throttles the steam supply or greatly shortens the cut-off when speed exceeds a certain limit, as it might in case an air pipe should break or other accident occur.

There are occasional instances in which governors of one or other of the above classes are used in connection with a unloader on the air end, so arranged that, as speed falls off, the load is partially taken from the air end. These are the specialities of individual builders, and as such cannot be elaborated upon here. The two general classes defined cover the general requirements of this paper.

Since the power driven compressor is almost always a constant speed machine, the methods of regulation and governing described for variable speed steam driven machines evidently cannot here be applied. Con-

stant speed means constant piston displacement, and the problem of delivering a variable volume of air with constant piston displacement, becomes one of making a portion of that displacement non-effective in the compression and delivery of air. Only the fundamental principles of several methods of accomplishing this will here be discussed.

The first method is really one of unloading, rather than of regulating. A pressure controlled mechanism is arranged so that when pressure exceeds normal, due to excess of delivered volume over demand, a communication is opened between the two sides of the compressing piston. Usually this is accomplished by opening and holding open one or several of the discharge valves at both ends of the cylinder, the air then simply sweeping back and forth from one side of the piston to the other through the open valves and the air discharge passage. When normal pressure is restored, the valves are automatically closed, and compression and delivery are resumed. Evidently this is practically a total unloading of the machine for a longer or shorter period—a sudden release from load and a sudden resumption of load. Moreover, the air which is swept back and forth by the piston in its travel is air under full pressure, so that when the discharge valves suddenly close, the piston at once encounters a full cylinder of air at maximum pressure. These facts limit regulators of this class to machines of comparatively small capacity.

Another method provides, by means of a pressure operated device, for the partial or total closing of the compressor intake under reduced load. To avoid the dangers attendant upon such an operation acting suddenly, these devices are provided with some damping mechanism so that they are compelled to operate slowly, making the release or resumption of the load gradual. The cutting down of the air intake results in a rarification of the air entering the cylinder, and a greater range between initial and discharge pressures, with a corresponding increase in the range of temperatures. This method of regulation, therefore, is not suitable for very great load variations; nor is it recommended for such conditions by the builders responsible for it.

The third method is very similar to the first, except that here the inlet valves, instead of the discharge valves, are held open when the machine is unloaded, the piston thus simply drawing in and forcing out air at atmospheric pressure. It is open to the same criticism (though in somewhat less degree) as the first method namely, undue shock and strain on release and resumption of load.

The fourth method uses a pressure-controlled valve on the compressor discharge of single stage machine, combining also the functions of a check valve to limit the escape of air from the receiver of air line. Excessive pressure blows the discharge to atmosphere, instead of into the line. This arrangement is also used on two stage machines by placing it on the low pressure discharge to the intercooler. Then, when the governor valve is opened by excess pressure, the low pressure cylinder discharges to atmosphere, and the high pressure cylinder acts simply as a low pressure cylinder with intake at atmospheric pressure. This device is more of a relief valve than an unloader, for the piston must continue to compress to a pressure which will open the discharge valves, and this volume of compressed air, with its power equivalent, is wasted.

Yet another method of regulation provides auxiliary clearance spaces, or pockets, at each end of the cylinder, which are successively "cut-in" as load diminishes. The excess air is simply compressed into these clearance spaces and expanded on the back stroke. The capacity of the cylinder is reduced without any appreciable waste of power, for the energy used in compressing the clearance air is given back by its expansion.

On power driven compressors with Corliss intake valves, several different methods of unloading or regulating are used.

By one method, the Corliss valve is held open for the full admission stroke, and also for a part of the compression stroke, this latter portion being determined by the unloading called for. Evidently this is practically equivalent to a shortening of the stroke of the compressor.

By another method the Corliss intake valve is opened full at beginning of admission, but closes later in the admission stroke. The air admitted to that point is expanded or rarefied for the remainder of the compression stroke, and then compressed, the volume of compressed air delivered being of course reduced. This arrangement is productive of an excessive temperature range in the cylinder. Still a third method opens and holds open the intake valves at the end of the cylinder, or at opposite ends in duplex machines. The effect of this is to make ineffective one out of every two strokes. If still further unloading is necessary, the intake valves at the other end of the cylinder or cylinders are opened and held open. The three arrangements just outlined all operate by a pressure controlled mechanism which actuates some form of trip on the Corliss air valve gear, somewhat similar to the release mechanism of the Corliss steam valve for varying the cut-off.

Three things are to be avoided in the successful unloader or regulator for power driven machines. first, a sudden release or resumption of load, throwing heavy strains on the machine; second, undue rarefaction of the intake air, resulting in a wide range of cylinder pressures and temperatures; third, the blowing-off of compressed air to the atmosphere with a waste of power.

In the regulation of the power driven compressor, less reliance must be placed upon the automatic regulation of the individual machine than upon the intelligent subdivision of the load between two or more machines and upon the careful management of the resulting plant. In designing a plant of these machines, maximum capacity must be cared for in the normal output of the machines, while partial loads are provided for by starting or stopping one or more machines, the remainder running at or very near full load. It is usually desirable to start a power driven compressor with no load, throwing on the load gradually after normal speed has been reached. This is in fact essential in machines driven by electric motors, for the heavy inrush of current in starting under load is dangerous, particularly where power is taken from a transmission circuit supplying other motors.

Evidently almost any of the unloading devices noted in the previous section can be used for this purpose if properly arranged for manipulation. The usual form, however, is simply a by-pass valve to atmosphere on the line close to the compressor protected by a check valve between it and the receiver to prevent the return of air from the line when the starting unloader valve

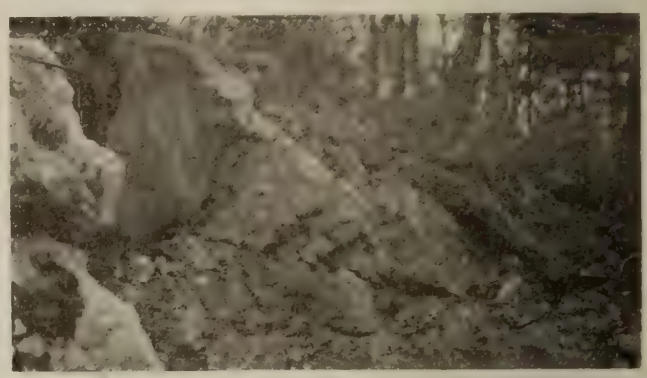
The Pitchblende Deposit in Butte Township, Nipissing District, Ontario

By REGINALD E. HORE.

During the past few weeks there has been much interest shown by prospectors in the radium ore discovery made by Wm. Elliott in Butt township. The accompanying photographs will give readers of The Journal some idea of the nature of the country in which the pitchblende has been found. Mr. C. W. Knight of the Ontario Bureau of Mines has briefly described the deposit in the Oct. 15 number of The Journal. The photographs will supplement his description.

The Elliott Pitchblende Deposit, Close View.



The Barber Mica Deposit, Butt Township.

Since Mr. Knight visited the property there have been many claims staked in Butt township. There has been a search for pegmatite dykes that would astonish the resident of the Parry Sound and Muskoka districts, as it would those who have been prospecting for gold and silver. Pegmatite dykes are abundant in most areas of the old crystalline schists. Yet in Butt township where they are most in demand very few are exposed. The rocks in which the pegmatite occurs are ordinarily of little interest to the prospector in Ontario, for they are granite and diorite gneisses. Mr. Elliott's discovery, therefore, will lend new interest to these formations and possibly result in further important discoveries being made in areas that have hitherto been considered as unpromising.

The Elliott Pitchblende Deposit, General View.

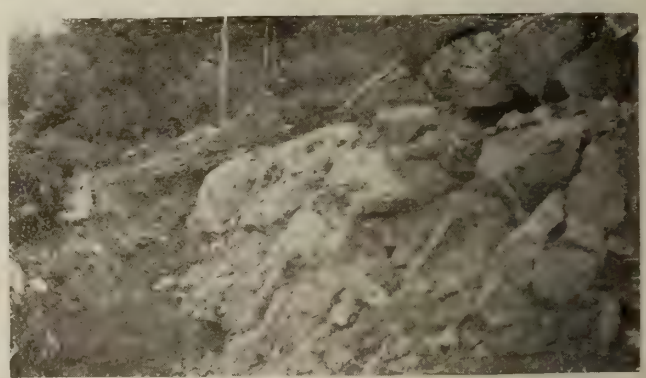
The Elliott discovery was made while developing a pegmatite dyke which contains an abundance of mica. The exposure is at the edge of a little peninsula in Mica Lake. The dyke is probably a big one, but very little of it can be seen. Only the footwall portion has been exposed and that only for about 40 ft. The photographs help to show why so little is yet known about the extent of the deposit.

In the dyke there are numerous muscovite mica crystals three or four inches in diameter. Thin leaves of this mica are nearly colorless and clearly transparent, but show numerous inclusions of green, red and black minerals. The crystals derive from the inclusions a brownish color.

In addition to the transparent muscovite mica there are also present crystals of black opaque biotite.

The feldspar crystals that form a great part of the pegmatite are plagioclase feldspars of red, flesh, and greyish white color. Some of the nearly white feldspars at the edge of the dyke show very distinct plagioclase striations. The red feldspars have also these characteristic striations. Some of the large crystals are partly red and partly white.

The quartz in the pegmatite is in part nearly colorless, but some is very dark colored—smoky quartz.



Another View of the Elliott Deposit.

The pitchblende, which is a heavy mineral and should be readily recovered by ordinary concentration methods, occurs in shapeless grains. Its name suggests its appearance, for it is a black mineral with a lustre resembling that of asphaltum. It is fairly hard and of high specific gravity. It occurs chiefly in the red feldspar, but not in all cases. The grains I have seen are nearly all in the red feldspar. In one case I noticed the characteristic weathering product, a yellowish powder which is probably uranium oxide.

Pitchblende is an amorphous variety of uraninite which is a uranate containing lead and rare metals of the lanthanum and yttrium group. It is distinguishable from most of the common black minerals by its high specific gravity and lack of crystalline structure and by the pitchy lustre. According to Brush it is soluble in dilute sulphuric acid with slight evolution of a gas (helium).

The rock which forms the footwall of the Elliott pitchblende deposit is a dark grey crystalline rock in which the most notable mineral is biotite or black mica. There is also an abundance of quartz and a white feldspar. The crystals are about the size of ordinary granulated sugar. Weathered portions of the rock close to the dyke are very friable—easily broken in the fingers.

The method of separating radium from uranium is described in Bull. 104 of the U. S. Bureau of Mines. Radium is used chiefly by the medical profession, the emanations having been found to have the power of curing various diseases. The chief source of radium in America is the carnotite deposits at and near Placerville, Colorado.

PORT ARTHUR NOTES.

(By J. J. O'Connor.)

The romance of a Chicago wholesale merchant finds its settling in the gold regions of Northern Ontario.

Last year Mr. Robert Wachman of 4439 South Michigan Boulevard, Chicago, Ill., came to Dryden, Ontario, to spend his vacation in fishing, hunting and boating. Falling in with an old prospector named Gus Larssen, Mr. Wachman rapidly became inoculated with the mining fever. He lost no time, first in formulating a comprehensive plan of campaign, and second, in beginning intensive work.

Having acquired 2,100 acres of mineral lands at Contact Bay, Vermillion Lake, and formed the Wachman Mining Co., Ltd., with a paid up cash capital of $500,000. Mr. Wachman started to make things move.

The company's lands are reached over a government road, and lie six miles south of Dryden, on the Canadian Pacific Railway. The main vein shows spectacular specimens of native gold over 400 feet of its extent, whilst the vein has been traced for 2,640 feet on the Wachman land, and runs to the adjoining territory of the Rogon Mining Co. Several subsidiary veins, carrying native gold, have also been discovered. On the Rogon property, the vein enlarges from a few inches on the surface, to a width of 12 feet at the 100 foot level.

On the Wachman property, the vein widens from 6 inches at the surface, to 3 feet, at a depth of 15 feet. At this depth a 6-inch paystreak shows, and a series of stringers encountered in sinking, consolidated to form the vein. The gold is free milling, carrying a large percentage of silver. A mining representative of the "Winnipeg Tribune" affirms that average assay values of $700 per ton were obtained by him.

Sixty men are at present employed in building camps and sinking. It is proposed during the winter to sink three shafts, each to a depth of 800 feet. Diamond drilling will be consistently pushed.

A complete 20 stamp mill, with all necessary power, crushing and handling equipment has been purchased, and will soon be installed. The contractor in charge of erection of the mill will receive a bonus of $1,000 if he has steam up on May 1st, 1920.

All ore assays so far obtained indicate a present high average. Ore will be supplied to the mill from four contiguous claims.

One pleasant feature of the situation is that Mr. Wachman's Company has no stock, or securities of any kind for sale. The unique policy of setting aside a large amount of money ($20,000) for distribution amongst employees after three months' service, has been adopted.

The head office of the company is located at Dryden, Ontario, where Mr. Wachman will be pleased to answer all inquiries, or refer them to the "Winnipeg Tribune," Winnipeg, Manitoba.

Incidentally, Mr. Wachman is a native of Courland, and was educated in Dublin, Ireland, and has spent his business life in the United States and Canada.

The Nicholls Chemical Co. are about to commence the construction of an ore dock on the Mission River, just east of the Canadian National freight sheds at Fort William, for the purpose of handling their pyrites ore from the Northern Pyrites Mine, at North Pines, Ontario, and also from their pyrites property at Mokoman, about 30 miles west of Port Arthur. This dock will cost $100,000, and be ready for operation in the spring of 1920. It will afford facilities for the shipment of local iron ore.

Col. Milton Francis manager of the Port Arthur Fort William Development Association is in correspondence with Mr. Bradley Stoughton, Secretary of the American Institute of Mining Engineers, in regard to a proposed visit of the members of the Institute to Port Arthur, in September 1920.

He is also in correspondence with Mr. H. Mortimer Lamb, Secretary of the Canadian Mining Institute, regarding the selection of Port Arthur for the annual meeting of the Institute, to be held during the frst week of March 1920.

One of the syndicate that owns the Czone Siding, zinc ore property, situated about 70 miles east of Port Arthur, on the line of the Canadian Pacific Railway, has recently visited New York, conducting negotiations for the sale of their property. The ore body has been traced for more than a mile. It is essentially a rich pegmatitic segregation in granite. It consists of from 2 to 3 feet of very spectacular zinc blende, adjoining, and surrounding which, are from ten to twelve feet of lower grade ore.

The chief workings are on an exposure which shows strongly on both sides of a creek bed, the vein has been trenched at various points on its length for over a mile. The owners are Messrs. Lawrence and Rochon of Fort William, and Dr. R. J. Manion M.P. of Fort William.

Some Elements of Economy in Air Compression.

Concluded from page 829.

is open. This check valve is essential where several compressors serve one line, permitting cutting in or out any machine without unloading the others. This by-pass valve is opened on starting, when the compressor simply compresses to a pressure sufficient to open its discharge valves, this air escaping to atmosphere. When normal speed is reached the by-pass or unloading valve is gradually closed and load resumed. On two stage machines, an unloader valve should be provided on the low pressure discharge of the inter cooler, as well as on the high pressure discharge to the line. In the latter case, both cylinders operate momentarily as low pressure cylinders.

Our Northern Ontario Letter

The Silver Mines.

Cobalt mining companies are selling silver at the highest figure in their history. Dispatches from London declare that quotations have reached a higher point than ever before. Metal authorities point out that the demand is without precedent. Producers have figures to show that the world output of silver is declining. As a natural consequence the situation is plainly beneficial to the producers.

While the silver currency of the British Isles is being threatened with the possibility of being relegated to the melting pot, and while small silver coins appear to have disappeared almost entirely in Old France, each constituting a source of anxiety among the financial experts of these two great nations, the silver mines of the world are reaping the benefit, and, in the case of Cobalt with its world-famed high grade silver deposits, are speeding up operations to the maximum capacity in an effort to take full advantage of this greatest opportunity so far in their history.

On October 31st the Coniagas Mines closed its fiscal year. It will probably be a month or so before the annual statement can be prepared. In the meantime it is learned that production exceeded three-quarters of a million ounces and that ore reserves are from two to three years ahead of mill requirements based on the present capacity as well as silver at a point above $1 an ounce.

The Mining Corporation is stated to be negotiating with a view to, if possible, acquiring the Thompson-Krist property at Porcupine. At the time of writing, no official statement has as yet been issued.

The Trethewey-Cobalt Company will hold its annual meeting Friday, Nov. 7, in Toronto at which time the question of acquiring additional prospective mining property in the Gowganda district will be brought up for consideration. It will be recalled that the Trethewey, when optioning the Castle a year or so ago, optioned only 51 per cent of the 1,500,000 shares. The annual meeting will deal with this matter and the cancellation of certain agreements pertaining to the minority interest will take place. Among the new properties mentioned as likely to come up for consideration is the Major claim as well as a lease of 112 acres lying under Miller Lake.

According to advice received from Texas, drilling on the oil lands of the Nipissing Mining Company has attained a depth of about 2,200 feet. As yet oil has not been encountered, but officials of the company appear to entertain hope of success. The zone in which oil has been encountered in the vicinity of the Nipissing holdings, ranges from a depth of from 1,700 to 4,000 feet.

Work being done on the Nipissing Extension property is meeting with satisfactory results. A second vein containing high grade ore has been opened up on surface. It has been found to measure about one inch in width and has been opened up for about 60 feet in length. Major Birkett is in charge of operations.

According to unofficial reports, the Buffalo Mines and the Temiskaming Mining Company have been negotiating with the object in view of the Temiskaming taking over the Buffalo. Officials of the latter company declined to make a statement this week regarding the matter.

High grade ore has been encountered on the old Silver Cliff Mine, being operated under lease by the Northern Customs Company. During the past month it is learned that considerable ore has been taken out of the Silver Cliff. The Northern Customs lease has to do only with that part of the property lying between surface and a depth of 500 feet. Below the latter point the Colonial Company is part owner.

In the outlying silver districts, the Gowganda field is easily the most active, especially in the vicinity of the Miller Lake-O'Brien. A good deal of activity is also taking place in the Leroy Lake section of the Gowganda field. The Camburn Silver Mines at the head of which is identified Messrs. Campbell and Fairburn, former leaseholders of the Foster Mine at Cobalt, is exploiting the old Leroy Lake property, and prospects are stated to be encouraging. Other properties on which exploration work is being done are the Collins and the McDonald. On the former a small steam plant is in operation and a shaft has been driven to a depth of about 170 feet.

The White Reserve Mine in the Maple Mountain section of the Elk Lake district continues to attract attention as a result of the high grade ore recently encountered there. Arrangements have been made to send out a shipment of ore during the coming winter.

In the South Lorrain area, activity has reached almost low ebb, the Keeley Mine having been closed down for the winter, and leaving the Pittsburg-Lorrain the sole operating property in that once active district. It would now appear that the anticipated revival of activity in South-Lorrain as a result of the high quotations for silver will at least not materialize until next summer.

The Gold Mining Area.

In the gold mining districts of Northern Ontario the shortage of unskilled labor continues to be a perplexing problem. The peculiar part of the situation is the fact that the shortage is greatest in the larger centres of activity. For instance, in Porcupine there is at present a shortage of close to 2,000 men, while at Kirkland Lake the mines are experiencing very little difficulty in securing large enough forces to fill all vacancies. When the time comes to fully man the mines in the Kirkland Lake field, it is feared more difficulty may be encountered. At present working forces are about one-quarter of the number before the strike was called in June. In the other mining districts. such as Boston Creek, Larder Lake, Bourke's and Fort Matachewan, no serious difficulty is felt in procuring the desired number of men, although in all districts the shortage is more or less felt.

In the Porcupine district mechanical muckers are being tried out, and good hopes are entertained that this may offset the unskilled labor scarcity to at least some extent. As to this, only the future will decide.

The Dome Mines is said to be treating around 1,000 tons of ore daily with about 300 men on the pay-roll, or an average of over three tons per day per man. Compared with this, the Hollinger and the McIntyre are able to handle only about fifty per cent of this tonnage, or between 1½ and 2 tons daily per man. Mining men are pointing to the Dome's achievement as an assurance that costs are being maintained well within bounds and that the president will probably be able to make good his promise to pay a dividend within the next two months.

The Clifton-Porcupine is being aggressively developed, and it is officially stated that a substantial amount of commercial ore has been put in sight.

The Gold Centre Mining Company has decided to explore their Boyce property by use of a diamond drill and arrangements are being made to do from 3,000 to 5,000 feet of core-drilling.

The McIntyre-Porcupine Company is reported to have acquired a working option on the property of the Martin Gold Mining Company, situated in the Harricana River district, near Amos, Que.

Among the mining companies subscribing in a big way to the Victory Loan, 1919, are the Hollinger and the Mining Corporation, the former taking $1,750,000 and the latter $1,000,000.

According to official advice to your correspondent, the Tough-Oakes Mines will remain closed until March, this decision having been reached at a recent meeting. It is believed by that time the economic situation will have improved, the problem of heating the large plant during the winter months will not have to be met.

The Lake Shore, Teck-Hughes and Kirkland Lake Gold Mines are all three making steady progress in their effort to get back to normal rate of operation. A number of the smaller properties are also getting under way, including the Canadian-Kirkland which property is under option to the Crown Reserve.

It is stated in usually well-informed circles that the firm of Hamilton S. Wills still entertains hope of being able to secure control of the property of the Orr Gold Mines. It will be recalled that the latter was for two years under option to the Kirkland-Porphyry, which company recently went into voluntary liquidation, and with which company was identified the Will's firm. Reports, therefore, are conflicting for the reason that only a few days ago it was intimated that the Teck-Hughes Mining Company appeared to have fair prospects of being able to secure the Orr.

At Boston Creek, the Miller Independence Mines announce that they will build a road from the station to the mine. The new highway is to be graded and be sixteen feet in width. It is an interesting fact that the retiring Ontario government promised to construct a road for the benefit of the mining properties in the Boston Creek district, but that such a promise will now rest with others. The neglect of the government to assist in past years in road-building in the Boston Creek district is pointed to as a glaring instance, and it is quite unfair that a private enterprise should be compelled to construct a highway which the general public makes use of.

According to an oficial statement just received, aggressive development work will be carried on at the Boston-Creek property. It is stated that eighteen men are at present employed, and that sinking operations are underway. The shaft which is down 40 feet will be continued to a depth of 100 feet. As to the diamond drill campaign, the official statement says:

"The north fractured zone is being core-drilled for the purpose of exploring the altered basalt at depth. At surface, this wide fractured zone is made up of characteristic altered basalt in which occurs numerous quartz stringers that contain calaverite as well as visible gold, the whole indicating a comparatively wide ore body."

The Sullivan and the Siscoe properties, in the Harricana River district in Northwestern Quebec, which are under option to the British Minerals Corporaton, are to be aggressively explored.

Payments have been made at regular intervals on the purchase price of the Murray-Mogridge property, and upwards of half of the total of $100,000 has now been paid. On the remainder, it is learned, an extension for one year has been secured. The company is stated to have undergone a reorganization, control having been either underwritten or purchased by New York interests. It is understood operations will be resumed this winter.

Ore and Bullion Shipments from Cobalt.

During the week ended Oct. 31st, four Cobalt companies shipped a total of nine cars containing 731,792 pounds of ore. The Buffalo, with three cars containing over a quarter of a million pounds, was the leader

Following is a summary:

Shipper.	Cars.	Pounds.
Buffalo	3	263,945
Mining Corporation	3	217,156
McKinley-Darragh	2	189,309
Hudson Bay	1	61,382
Totals	9	731,792

During the corresponding period, the Nipissing was the only bullion shipper, a consignment made up of 75 bars containing 101,370.43 fine ounces having been sent out on the 29th.

The litigation in which the Bailey-Cobalt has been involved during recent years, and which appeared to have drawn to a close, took another turn a few days ago, and an appeal is being heard this week in Toronto. Provided the offer of A. J. Young is accepted, the property will merge with the Northern Customs Company, to be known as the Bailey-Northern Customs, Limited, with an authorized capital of 1,250,000 shares of the par value of $1 each, and with $50,000 working capital in the treasury. It was the intention of the new concern to commence operations this month, but the present delay may defer developments until some time in December.

Mr. Arthur Balfour, who was a member of the British Coal Commission, is now in Canada, visiting the Canadian office of the Arthur Balfour (Canada) Co., Limited. Mr. Balfour's firm is a large manufacturer of tool steel, and he is visiting Canada for the first time since the war.

Special Correspondence

BRITISH COLUMBIA.

The Metal Mines.

Cowichan, B.C.—A gold-copper prospect, located near the headwaters of the Nanaimo and Chemainus Rivers, has been inspected by Wm. M. Brewer, government mining engineer, an application has been for assistance in meeting expenditures involved in the construction of a trail to the property. Development up to the present consists chiefly in the driving of a fifty-foot tunnel. Samples have given encouraging returns, running as high as $105 a ton in values. It is understood that engineers representing the Canadian Consolidated Mining & Smelting Co. are making reports on this prospect.

There is every reason to believe that the copper deposits of Mount Sicker and Mount Brenton are to be exploited on a considerable scale. The work started by G. B. D. Turner, of Butte, Montana, who represents New York interests, is being carried out in a business like manner, a 50-foot shaft having been sunk adjacent to the old Lenora Mine. Behind Mount Brenton and north of the Chemainus river, a copper deposit has been located, which is reported to be large in extent and high in values. The company developing the latter, in connection with which are mentioned the names of A. J. Palmer, of the Victoria Lumber Company and some American capitalists, is applying for water porwer rights on the Chemainus River.

In addition to the Manganese Mine, known as Hill 60, which is being operated by the British Columbia Manganese Company, regular shipments being made to the Tacoma Smelter, Cowichan District, possesses another promising manganese deposit on Shaw Creek. It is situated at the northwestern end of Cowichan Lake and there are reports that its development is to be undertaken. The only reason that this has not been done is that it is not as accessible as Hill 60 but, with the completion of construction on the Canadian Northern Pacific Ry., Vancouver Island, this and other dormant mineral sections will be provided with transportation facilities which are expected to lead to considerable mining activity. Rails have been laid as far north as the Koksilah River, Cowichan, and grading has advanced beyond the northwestern boundary of the Cowichan District on the Nitinat River.

The Blue Grouse Mine, situated on Cowichan Lake, is a promising gold-copper proposition which, as yet, is in a state of development. Some first-class shipments have been made to the Trail Smelter of the Consolidated Mining & Smelting Company. Diamond drilling has been done with results that are said to be satisfactory although no official information is available, the work having been carried out under the Consolidated Company, which is in control.

Stump Lake District, B.C.

In the course of the last few months this section has been visited by Charles Camsell, of the Canadian Geological Survey; Mr. Week, a mining engineer connected with the Bunker Hill and Sullivan Mining & Smelting Company, operating in the Coeur 'd Alenes, Idaho, and other mining men. Interest centered chiefly in the work of the Donohoe Mining Corporation in the unwatering of the Joshua Mine workings and the provision of the equipment necessary to place the property on a producing basis. The old Mary Reynolds Mine, on which development work has been in progress for some time under the supervision of R. R. Hedley, also was inspected. With reference to the Joshua Mine it is announced that the first mining operations will be on the 300-ft. level, water now having been cleared to a depth of 380 feet, and that shipments are expected to be made before long. As to the Mary Reynolds it is stated by Mr. Hedley that the showings are encouraging. He has made a shipment of 45 tons to the Trial Smelter and asserts that the new road to the property, in the construction of which financial assistance was tendered by the Provincial Government, has resulted in a considerable economy in the matter of transportation.

Stewart, B.C.

The survey of the proposed Government extension of the Premier Wagon Road to the Big Missouri Mine has been completed, according to James P. Suttie, who had charge of the work and has returned to Stewart. It is expected that the work will be started early next season and that it will be completed during the summer. This will facilitate the shipment of ore by such properties of the Salmon River district as the Big Missouri, Forty Nine, Unicorn and others. While there may be trial shipments from some of these properties this winter it is not thought that much ore will be sent out. The only regular shipper in the district this winter will be the Premier. It is understood that snow motors now are being built for the company and that they will arrive soon. Just how much ore it is planned to ship is not known but there is a considerable quantity on the dump. The Premier road is al most completed and when the snow comes it will be in first class condition compared with that of last year over which two shipments were made, the returns from which totalled $168,000.

A small shipment of highgrade ore has arrived at Hyder, Alaska, which is close to Stewart, from the Forty-Nine Mine. It is said to rank among the finest ore the district has produced and is expected to average $1,000 to the ton. H. Howson, who is in charge of the work, is very enthusiastic with the showing developed. The diamond drill work, now in progress, is reported to have demonstrated that the Forty-Nine is likely to become a producer of importance.

The mineral zone of the Salmon River is handicapped because of its situation. The rugged mountain range dividing Alaska from British Columbia forces the export of ore through American territory to Stewart, whence it is loaded for the smelters or concentrators. Representations have been made to the Canadian Government that a railroad be constructed to provide a ready outlet for the mineral riches of the country. The reply, it is understood, has been that it is impracticable to build such a road because, as matters stand, it would mean that a section would have to traverse American territory. Naturally, on the other hand, the American Government would be scarcely likely to undertake the work to take care of a Canadian output. Consequently the project, which is considered of first importance to prospectors and mine operators, has fallen back to the shoulders of the latter and everything possible is being done to

induce Sir Donald Mann, who is interested in the Big Missouri, and his associates to take up the task and to make a start next year.

Alice Arm, B.C.

Shipments from the Dolly Varden Mine to the Anyox Smelter of the Granby Consolidated Mining & Smelting Company have been closely inspected by mining men at Anyox who are reported to be favorably impressed. It is felt that the Alice Arm District of British Columbia has an assured future as a mining centre. Important developments are looked for with the completion of the plans of the Taylor Mining Co. in regard to its railway which, it is understood, is to be extended to the Wolf Mine, another silver producer some distance further inland than the Dolly Varden. The railroad now is handling a limited quantity of ore daily but with additions to the rolling stock and general improvements its tonnage capacity will be materially increased.

Quesnelle, B.C.

The announcement that the Ward-Hoppe litigation at last is at an end, the Privy Council having, according to cable advices, upheld the judgment of the Supreme Court of Canada in awarding the Bullion Mine, of Cariboo, to Mr. R. T. Ward and associates has been received with interest generally and with much satisfaction throughout the Cariboo. The latter feel that this large property now perhaps will be operated and the revival of the activity of its plant, which for so long has been idle, would mean considerable to the district. This hydraulic property consists of 1,200 acres. It originally was taken up by a syndicate of C.P.R. officials, the date being 1895, among whom were Sir William Van Horne, Baron Shaughnessy, and Messrs. W. D. Matthews and E. B. Osler, of Toronto, Ont. The syndicate worked it from that date until 1916, sinking a total of $3,500,000 in opening it up and equipping it, $1,500,000 of this amount being taken out of the property itself. Apparently no dividends were declared. In 1906 the syndicate sold to the Guggenheim, who incorporated a company under the name of Cariboo Gold Mining Co. This company never worked it but spent over $500,000 in further equipment and in digging a canal for water supply. There are over 50 miles of canals on the property and a number of large dams and reservoirs. In 1913 the property was sold by the company to R. T. Ward, of California. Ten days after Ward took possession, the property was claimed by John Hopp, a local man, on the ground that under the Mineral Act it had been abandoned, as a miner's license had not been renewed.

Fernie, B.C.

That the Premier Mine, Salmon River, B.C., has been sold is the effect of a report originating in Fernie, B.C., the home of W. R. Wilson, general manager of the Crow's Nest Pass Coal Co.; Roland Wood and A. B. Trites, all of whom are interested in the property. It is stated that the control, as a result of the deal, has passed to the American Smelting Company. Messrs. Wood and Trites are in New York, where the negotiations are said to have been concluded.

The Premier is the best known mine of the Salmon River section. It was because of the exceptional returns given by a carload of ore shipped from this property last winter that the rush of this summer to Stewart, thence to the mineral region of the adjacent interior, took place. The success of the Premier led to the opening up of the Big Missouri and of other prospects which are developing favorably.

Nelson, B.C.

The Beatrice Mine, of Cambourne, B.C., is beginning to ship and it is the intention of the New Era Mines, Limited, to continue the shipment of ore while developing the property. E. Bodine, a mining engineer who has been engaged until recently in the Mount McKinley district with the United States Geological Survey, is in charge of operations. W. E. Morphy, managing director of the company, reports that on No. 2 level, from which considerable ore was taken in 1911, the face is in ore and mining work will be continued in this body all winter. Generally speaking values, as far as past experience is concerned, have run around $60 in silver, when quotations on silver were low, and approximately 34 per cent lead. Drifting is under way from the point at which No. 3 tunnel cuts the vein, with the object of coming under the ore body of No. 2, when a raise will connect the workings. Mr. Morphy says that the company is looking forward to the installation of a mill next year.

Trail, B. C.

No fewer than six new properties make their appearance in the last list of ore receipts at the Trail Smelter of the Consolidated Mining and Smelting Co. of Canada. With the exception of the Sovereign, which is one of the properties operated by Clarence Cunningham in connection with his big reduction plant at Alamo, B.C., all the new shippers are for the time being minor properties under development, and all qualify in the silver-lead-zinc category. The list includes the Freddie Lee, which is being developed by A. W. McCune, and the Ocean at Sandon, the Little Phil and the Tariff, at Ainsworth, and the Zincton in the silver-lead-zinc belt of the Sheep Creek district.

Ore receipts in gross tons for the week from October 15 to October 21, inclusive, at the Trail Smelter of the Consolidated Mining & Smelting Co. of Canada, totalled 4,157, making the aggregate for the year 270,700 tons. The black Bear, of Rossland, with 591 tons; Josie, Rossland, with 174 tons; the Mandy, Le Pas, Manitoba, with 394 tons; the Quilp, of Republic Wn., with 479 tons, were among the chief independent shippers. Of the properties owned by the company the largest contributor was the Centre Star, Rossland, which shipped 1,652 tons. The Sullivan Mine, Kimberley, B.C., the biggest shipper when in operation again was conspicuous by its absence, the strike, to which reference already has been made, being still in force and there being no signs of a settlement.

Grand Fork, B. C.

The Molly Gibson Mining Co., operating about four miles from Paulsen, have struck ore assaying from $48.50 to $125.00 a ton in the lower tunnel of their workings. There are 60 feet of stoping ground and the work of development is proceeding energetically. It is understood that steps are being taken to provide transportation facilities it being the intention to start regular shipments as soon as possible.

Ainsworth, B. C.

A number of Ainsworth miners are forming a syndicate to work a claim known as the 4th of July, situated on Coffee Creek, at a point above the Eden

and Crescent Group. Some ore is reported to be in sight and it is believed that several carloads can be shipped in a short time.

Phoenix, B. C.

O. B. Smith, general superintendent of the Granby Mines Company, has been in Phoenix with E. E. Campbell, mine superintendent at Anyox, B. C., local into the situation with a view to formulating some plan as to the future of operations in that locality. It is apparent that nothing will be done this year but it is considered likely in that district that a concentrator will be installed and mining on a limited scale re-commenced in the spring.

Republic, Wn.

All mines of Republic (Washington) Camp are reported to have closed down some days ago, as a result of a demand by the miners for an increase of $1.00 a day in wages. About 50 or 60 men are affected. Thus the same situation as prevails at Kimberley, B. C. would appear to be developing across the line.

Lightning Peak, B. C.

Favorable reports are received from the Rampolla Group of Claims which are among those which are being developed on Lightning Peak, B. C. Two tunnels have been run on the Rampolla. One is in 150 feet and at the face is in 30 inches of high class ore, which, it is estimated, will assay between 250 to 300 ounces silver. B. Cordiana, who has been in charge of this work, is said to have brought to Nelson, B. C. some of the most beautiful specimens of silver and gold seen in the district.

Camborne, B. C.

The Burniere and Nelson Mineral Claims, situated six miles from Camborne, have been taken over by what is known as the Burniere Gold Mining Company, Indianapolis. The company announces its intention to develop these properties extensively, the construction of a modern mill, which will be in operation by next mid-summer, being planned. The Burniere and Nelson Groups are on the westerly slope of Fish River, and are nine miles from the Beatrice Group, of the New Era Mining Co. It is claimed that the output of the Burniere will average $50 a ton.

THE COLLERIES.

The consumption of coal in the City of Calgary and that part of the adjacent district which has been largely dependent for its fuel and lighting on the natural gas of the area is expected to be largely increased during the coming winter. This is explained by the fact that the supply of gas appears to be failing. The pressure in the City is falling to such an extent that the City Commissioners have ordered that all buildings under their control shall be fitted to use coal with as little delay as possible for heating purposes. The reason for the recent somewhat alarming reduction of pressure is given as being the continued cold weather but the possibility of such a contingency has been foreseen by many, as more than a few of the larger buildings of the City have been changed in respect of their heating arrangements for several weeks.

What will be the effect of the general strike of bituminous coal miners in the United States on men similarly employed, and affiliated with the United Mine Works of America, in Canada? That is a question which is giving some concern to Canadian operators, as well as to the general public which is dependent to a large extent on the output of Canadian mines for their winter fuel. In District 18, U.M.W. of A., which comprises Eastern British Columbia and the Province of Alberta, the concensus at present seems to be that the United States strike will not extend to Canada. At the same time preliminary strike orders have been received by unions of District 18. Officials say that the Alberta miners are not in a mood to strike so soon after the long period of idleness resulting from the One Big Union fight and that, the majority, if ordered to leave work would be likely to refuse. In the event of matters coming to an issue it is considered possible that a movement to secede from the U.M.W. of A. would receive general support. The place of the latter, it is suggested, could be taken by a Canadian Mine Workers' Union.

There is no present indication of a coal shortage in British Columbia. Dealer of Victoria and Vancouver state that there is plenty of lump and nut coal available to meet the current domestic demands. The price of $11.50 per ton, it is thought, will stand. As to the possibility of a shortage later none will venture an opinion. The mines of Vancouver Island, however, are producing steadily and it would appear that the only problem is that of transportation.

B. C. SEPTEMBER COAL PRODUCTION.

The output of coal by British Columbia Colleries for the month of September was as follows:

Crow's Nest Pass Field.

	Tonnage
Crow's Nest Pass Coal Co., Coal Creek	32,192.
" Michel	17,400
Corbin Coal and Coke Co., Corbin	9,537
Total	59,129.

Nicola Field.

	Tonnage
Middlesboro Colleries Ltd., Middlesboro B. C. (short tons)	8383
Fleming Coal & Coke Co., Merritt B. C. (tons)	3155
Coalmont Colleries Ltd., Coalmont B. C. (tons)	1379
Total	12,917

Vancouver Island Field.

	Tonnage
Canadian Western Fuel Co., Nanaimo, B. C.	27,340
" Harewood Collieries	19,302
" Reserve "	5,453
Total	50,095

Pacific Coast Mines Ltd., Morden	5,501
British Columbia Coal Mfg. Co., Jingle Pot	3,344
Nanoose Colleries, Nanoose Bay	2,306

It will be noted that the production of the Canadion Colleries (D) Ltd. are not noted, they being unavailable at the time of writing.

Nova Scotia Notes

Production of Coal.

The output of the collieries is increasing owing to the stimulation of demand caused by the railway strike in England, the heavy demand for coal from Scandinavian countries, Holland, and all the Mediterranean ports as far as the Levant. The longshoremen's strike in New York, and now the strike of the bituminous coal-workers in the central competitive district of the United States, are added reasons for increased demand, with of course the likelihood that if the U. M. W. of A. strike is prolonged, as there seems every reason to suppose it will be, the demand for bituminous coal from Canadian sources will become very insistent. Unfortunately, the collieries in Nova Scotia are not in the best position to take advantage of the great demand for coal, as the output capacity of the collieries is much less than it was before the war. This condition exists irrespective of the still unsatisfactory condition of the working organizations, which are yet—and must continue for some time to be—unbalanced and inefficient.

The output of the Cape Breton collieries of the Dominion Coal Company during October was 280,068 tons. A comparison of October outputs over the past ten years is given below:

1910	330,494 tons	1915	408,247 tons
1911	348,062	1916	313,983
1912	422,343	1917	291,927
1913	438,272	1918	275,890
1914	368,016	1919	280,068

Compared with recent production, the October figures are encouraging, being the highest for one month since August 1918, when the output was 288,781 tons.

The Nova Scotia Steel Company's output during October was 56,507 tons. This is an increase of 4,000 tons over September production, and is the largest October output since 1915. The collieries produced severally as under:

Princess	15,320 tons
Florence	21,913
Scotia	8,184
Jubilee	11,507

Fatal Accidents.

The Mines Office at Halifax states that for the Government year ending Sept. 30th, 1919, there were 17 fatal accidents in the mines of the Dominion Coal Co. and the Scotia Co. at Sydney Mines, for a combined production of 3,542,280 tons of coal.

The Dominion Coal Co. mined during the period from Oct. 1st, 1918 to Sept. 30th, 1919, 3,037,435 tons of coal, and within that time they have had 15 fatal accidents. The Scotia Co., had mined 504,845 tons for two fatal accidents while in 1918 there was a production of 520,677 tons for seven fatal accidents.

All the fatalities in the Dominion Coal Co's mines, occurred in the Glace Bay district, Dominion and Reserve being excluded. There was not one fatal accident in Waterford. The number of mine accidents is being gradually reduced through the greater care and precaution exercised by the men and officials.

LABOR AND WAGES.

The representatives of the coal operators and the mineworkers met in Sydney on the 29th October to discuss the renewal of the wage agreement which has now expired. The men are asking for standard rates at the Nova Scotian collieries, in place of the rates which now exist. These have always varied in the several districts, owing to the differing condition of work, and to some extent because of the lesser cost of living in some localities. The U. M. W. asked that the existing minimum wage for common labour should be increased from $3.11 to $3.40 per day, and submitted the following schedule of the standard rates desired by them:—

Ordinary labor	$3.40
Lamp cabin men	3.90
Lamp cabin boys	2.86
Blacksmiths	5.02
Blacksmiths' helpers	3.34
Hoisting engineers (Coal and man engines)	4.60
Haulage engineers	4.24
Man engineers	3.76
Compressor oilers men	3.83
Compressor oilers boys	2.95
Screen engineers	3.77
Carpenters (Co. to furnish tools)	4.33
Tubmen	3.39
Electricians (left open)	4.21
Mechanics	5.07-4.79
Head firemen	4.21
Stokers and ash wheelers	3.62
Conveyor men	3.75
Pumpmen	4.64
Mason and Bricklayers	5.90-5.30
Teamsters	3.40
Box car loader operator	3.40
Boiler makers	5.07
Boiler makers' helpers	3.80
Locomotive fitters	5.07
Drill hands	3.81
Car shop men	3.54
Painters	4.11
Pipe fitters	4.50

Underground.

Ordinary labor	3.40
Shiftmen and timbermen	3.85
Drivers	3.40
Landing tender	3.87
Shaftmen (left open)	3.86
Trapper boys	2.18
Chain runners	3.87
Stablemen	3.60
Cage Bottomers (left open)	
Donkey drivers (left open)	3.34
Brake holders	3.40
Roadmakers 80 lb. rails	5.50
Roadmakers (left open)	
Mine examiners	4.50
Pick boys	3.40
Rope splicers (left open)	
Slope timbermen in pitching seams	6.00
Fan turner	3.40
Boys pushing down coal	3.40
Shot firers	4.50
Relightermen	3.40
Air Locomotive drivers	4.06
Shot firers' helpers	3.58
Boss drivers	4.00

The conference failed to reach a complete agreement, although it is stated it was marked by friendliness on either side. An official statement was issued by Mr. Charles Fergie, who acted as Chairman of the Conference, as follows:—

"At the joint conference held yesterday in the general offices of the Dominion Steel Corporation by representatives of the coal operators of the province, and the Executive of the U. M. W., the operators informed the representatives of the men that, after giving most careful consideration to the wage schedule presented by the Union, it was found that the business situation and the differences in operating conditions at the several mines in question made it impossible for them to bring the rates paid at the various mines to one common standard.

"The men were informed that the operators could not, at the present time, accept such a schedule as that presented by the Union, or pay the rates named therein. It was pointed out that many of the proposed rates are excessive, and in fact that some of them are not in existence at any of the collieries under the classification shown in the schedule as submitted to the operators.

"Mr. Fergie, in speaking for the companies, stated that they are desirous of meeting, to the extent possible, the requests of the men, and that they would consider paying a higher standard for one or two classes of the lower paid men, both on the surface and underground, provided the Union would enter into a contract agreeing that no further wage demands would be made by the men for a period of one year.

"The men's representatives informed the operators that such a condition would not be accepted by them and they stated they would not enter into an agreement covering any fixed period even after a joint consideration of their proposed schedule of rates.

"This statement, Mr. Fergie announces, compelled him to say that, in view of this unfortunate attitude on the part of the U. M. W. executive, the operators were regretfully forced to the opinion that no satisfactory aggreement appears to be possible at the moment. He added that it is hoped the men will reconsider their position on this point at an early date and so permit the continuance of efforts towards an amicable solution to this important question at an early date."

It is announced by the U. M. W. Executive that application will be made for a Board of Conciliation. Speaking to the Sydney "Post," the Secretary of the U. M. W. said:—

"I believe the fact that the United States miners are carrying on negotiations for wage increases is prolonging our case here to an indefinite length.

"We are no further ahead now than we were when the negotiations opened." The miners are now working on the old schedule of rates, the contract for which expired some weeks ago. Until some settlement is made we will of course continue working under those rates.

"One thing noticeable about our conference was the friendly spirit that existed between the representatives of the miners and the operators, but we didn't get much work done in the way of settling the dispute."

Fear has been expressed in some of the Montreal dailies that a sympathetic strike might be called in Nova Scotia by the United Mine Workers of America in aid of the strike in the central district, but there is little likelihood of this. In fact the report has been contradicted by the officials of the U. M. W. in Nova Scotia—as it has also been in Alberta— and the statement has been made that Nova Scotia will make its own decisions.

There is reason to believe that the demands now being made in the central district by the acting leaders of the U. M. W. there have been contemplated for some time, and that when the U. M. W. of America entered Nova Scotia recently, an understanding was arrived at which will prevent any sympathetic strike in Nova Scotia, as the central district does not desire to be burdened with strike payments from a district where the cessation of coal-mining could have but negligible effect on the main situation, and would at the same time be much resented in Canada.

Undersea Coal Areas in Cape Breton.

The Dominion Coal Company has announced its intention to open a mine at Bonar Head, a point lying approximately half way between Cranberry Head and the Little Bras d'Or Entrance. In choosing this site, the Dominion Company has elected to enter its undersea areas at a point where the workings of any projected colliery will abut upon and definitely limit the further extension of the workings of the Florence Colliery of the Nova Scotia Steel & Coal Company, which Company is now obtaining the greater part of the production of its Florence Colliery from a strip of coal, leased to the Dominion Coal Company, but now being mined upon by the Scotia Co., by virtue of permission granted under a provincial Order-in-Council. The bulk of the undersea leases of the Dominion Company lie between Bonar Head and Point Aconi, and the undersea territory which would be mined by a colliery located at Bonar Head is precisely the tract which is necessary to prolong the life of the Florence Colliery of the Scotia Company.

The Dominion Company has made the formal application required by the Coal Mines Regulation Act for permission to make a new undersea winning, and by doing so have raised the whole issue of the proper and workmanlike winning of the undersea leased area covered by the legislation of the Session of 1919.

Under this legislation the Governor-in-Council is empowered to appoint a Commission to enquire "whether any worked or unworked submarine coal-mining "area now held under lease and subject to the provisions of the Mines Act, can be advantageously "worked in the best interests of the Province by some "other lessee."

The contention of the Nova Scotia Steel Company before the Legislatures at the last session was that it could work the Bonar Head territory more advantageously through the existing openings and workings of the Florence Colliery.

It may therefore be anticipated that before approving the plans of the Dominion Coal Company to operate from Bonar Head, the Nova Scotia Government will appoint the Commission enjoined by the legislation referred to,and will await its enquiry and report.

The legislation referred to does not affect any of the consolidated areas included in the Blanket Lease of the Dominion Coal Company, which all lie to the southwards of the Sydney Harbour entrance. The Dominion Coal Company's leases north of Sydney Harbour are not included in the Blanket Lease, having been acquired by purchase subsequent to the specification of the boundaries of the Blanket Lease under the Acts of 1893.

An exchange of anonymous correspondence is being given much prominence in the Nova Scotia newspapers, regarding the existence or non-existence of metallur-

Electrically Operated Mine Hoist.

and this is not the only firm in Canada using seven of our Hoists.

Would these customers continue to purchase our Hoists from year to year as their business grows without a good reason?

Quality and service count for much more than price in the long run, and while we can assure you that the price of our Hoists is reasonable, the price alone would not have secured us these many repeat orders. These customers were satisfied with the quality of the Hoists, the honest workmanship and material put into the machines, the skill exercised in their design, and their comparative freedom from premature breakdowns or repairs.

Our Mine Hoists are built right, and give the best of service—that is why our customers stay with us, and continue to order more machines as their needs increase.

Choice of 7 sizes in either Electric or Steam Hoists, ranging from 10 H. P. to 50 H. P.

gical coal and the thickness of the coal seams in the Bonar Head district, all of which miss the main point of the problem as it presents itself to the government of Nova Scotia. The question which the government must decide, as the owner of the coal seams, and as the guardian of the public interest therein, is not concerned with the private interests of any of the lessees of coal areas, but is solely to be determined by whether or not the existing arrangement of the undersea leases is such as will ensure the maximum extraction of coal, at the lowest cost, over the maximum period of time. These are questions that can only be decided by independent and impartial enquiry by competent engineers, and as the government is fully empowered to institute such an enquiry, the appointment of a commission seems the logical course.

The S. S. "Rosecastle" has been returned to the Dominion Coal Company by the Admiralty. This vessel made her maiden voyage to Canada in 1915, arriving at Louisburg on the day that the "Lusitania" was torpedoed. This day will be remembered by a number of the officials of the Dominion Coal Company, who indulged in an unusual holiday by going to Louisburg to meet this vessel, whose safe arrival at a time when the high seas were so unsafe, was a matter for congratulation, a feeling that was turned to something approaching consternation when on arriving back at Glace Bay they learnt of the wanton, but pregnant action of the Germans in sinking the "Lusitania" and murdering her passengers. The "Rosecastle" carries some 10,000 tons of coal. There are still two others of the Dominion Coal Company's freighters to be released.

CROSS-COUNTRY PERSONALS.

Nova Scotian, and more particularly Cape Breton readers of the 'Journal' may be interested in the following gleanings from the Western Canada Coal Review, a coal trade paper published in Winnipeg, which covers the four western provinces, and pays particular attention to the sales end of the coal business.

The contents of the latest issue show how greatly the coal industry of the West has drawn upon the men trained in the coal districts of the East. An article on "Figuring Costs in the Retail Coal Trade," promises a series of articles on coal sales accounting by Fraser Cameron, district sales manager of Coal Sellers, Ltd., Winnipeg. Mr. Cameron was formerly with the Dominion Coal Company at Glace Bay, and for many years filled the responsible position of cashier to that company. He was born in Glace Bay, and his brother was mayor of that town. Mr. Cameron must have realized that changes had taken place in his native town, when, on the occasion of a recent holiday visit to his home, a local newspaper referred to him as "a man who used to live in Glace Bay!"

Another article in the October issue of this western paper is by Mr. Frank Sawford, who was for a long time the electrical engineer of the Dominion Steel Company, and afterwards was mechanical engineer to the Canadian (D) Collieries, Ltd., of Vancouver Island. He is now a member of the Taylor Engineering Co. of Vancouver. Mr. Sawford's abilities have been generally recognized in the West.

The following items from the "Screenings" column will also appeal to Cape Breton readers.

Daniel MacCauley has been appointed mine manager with the Newcastle Coal Co., Drumheller, and Mr. Peter Murphy has been appointed overman.

Mr. Donald McAskill has been appointed overman with the Atlas Coal Co., Drumheller.

Mr. Andrew McQueen has been appointed overman at the mine operated by the Lethbridge Coal Co. Mr. McQueen has recently returned from overseas service.

Mr. Joseph MacIntyre has been appointed mine manager with the Sherness Coal Co., Sheerness.

Mr. H. A. Lovett, K.C., of Montreal, president of Coal Sellers, Ltd., recently visited the Winnipeg office.

MINING ENGINEER, Scotch, University and Royal School of Mines, liberal education, 30 years wide general experience, business success, responsible manager German and Spanish mines, underground and large open workings, copper, lead, limonite, lignite, manganese, exceptional knowledge diatomite, expert surveyor, two years successful college lecturer; Mining and Surveying, experienced prospector, reporting, best references for ability and character, excellent health, go anywhere at once, prepared to earn promotion, steady employment with good concern desired.

Winnipeg and Toronto—A Parallel

Winnipeg men are drawing a parallel between the growth of Toronto, as it was assisted by the opening up of the mineral deposits of Northern Ontario, and the City of Winnipeg, as it may be affected by the development of the mineral deposits of Northern Manitoba.

The Manitoba Free Press writes: "Nothing in its "history did so much in a short period for Toronto "as the development of the mineral areas of Cobalt "and Porcupine, and the same remarkable expansion "may be witnessed in the next decade in this city."

The parallel seems to be correctly drawn. The authoritative descriptions which have from time to time appeared in the 'Journal' written by Dr. R. C. Wallace, the Commissioner of Northern Manitoba, and by Prof. Justin de Lury, leave no doubt of the great promise of the district north of Le Pas.

In this issue will be found a summary by Dr. Wallace of the work done in Northern Manitoba during the Summer just passed, together with a new map of the mineral belt tributary to Le Pas.

At the present time access to the district is very difficult, and will remain so until the extension of the railway from Le Pas takes place, but this extension, it is understood, is now assured.

In this connection, the significance of the mineral occurrences in the Upper Harricana River district of Northern Quebec, recently described in the 'Journal' by Mr. Adhemar Mailhiot, should not be neglected. As the Northern Ontario mining camps were opened up by the extension of the Temiskaming & Ontario road, so has the Transcontinental Railway opened up a new country, giving the district around Amos about equal facilities for access from either the City of Quebec or from Toronto. Our Northern Ontario correspondent suggests the likelihood of an extension of the C.P.R. road northward from Kipawa, which would mean a paralleling of the T. & O. through a district the similarity of which to that traversed by the T. & O., combined with known mineral occurrences, is such as to suggest that Northern Quebec may become the counterpart of Northern Ontario in due time. In such an event it will become a question of railway strategy whether the cities of the Province of Quebec will benefit from the wealth which undoubtedly is contained in the Province, or whether Toronto will experience a further stimulus from mining developments that are already in rapid progress in the Province of Quebec.

Free Competition in Coal Mining Undesirable

Mr. H. A. Lovett, giving evidence before the Coal Commission appointed by the Alberta Government which has been sitting in Edmonton, said: "Free com- "petition in the coal industry in Alberta has proved "an expensive luxury, and by it much money has been "wasted and lost. Twenty mines could produce the "six million tons of coal supplied to the prairies by "more than 300 mines working in Alberta."

Similar conclusions were reached by the various reports of the British Coal Commission, and in this regard all the reports concurred.

Actual trial demonstrated the evils of unrestricted competition and operation of coal mines in Nova Scotia, and led to the incorporation of the Dominion Coal Company in 1893, and a good many years ago after studying the history of the Nova Scotia coal trade from its earliest beginnings, the writer was compelled to the conclusion that the logic of events "indicated the chief hope of settled prosperity in the Nova Scotia coal trade to lie in the further development of strong corporations."

Whatever financial stability attaches to the coal companies of Nova Scotia is a testamentary benefit conferred by the General Mining Association, a monopoly that with all its faults, rendered it possible to conceive mining operations on a comprehensive basis, eliminated suicidal competition in selling prices; and enabled mine workings to be laid out with the maximum of economy, with due regard to the conservation of the vast coal reserves which sporadic individual operations have tended to endanger by uncoordinated effort.

The efficiency of monopoly in operation is not to be denied. Its dangers lie in the political direction, and not in the direction of the working out of monopolistic ideas in industry. The idea of the nationalization of coal is in the air. It is a plank of the platform of the labor party in England. It is one of the de-

mands of the labor party in the United States, and it is an accomplished fact in some countries.

The British Government has accepted the principle of public control of coal resources, but it has refused to accept the principle of public administration of actual production and management of the coal mines, believing that such is the province of private enterprise and initiative. At the same time, by providing for unified control of engineering problems within a selected district, it has placed its seal of approval on one of the most beneficial possibilities of monopoly, and has, to an extent that is yet to be realized, suggested the formation of great consolidations of colliery enterprises. It has in fact laid down the principle that where the conflict of private interests militates against the economical operation of coal-mining, these conflicting interests must be composed by private agreement, or submit to adjustment by officers of the State, but, in any event, the public interest is not to be endangered thereby.

The distinction between public ownership of the coal seams, and public oversight of their extraction and the engineering problems associated therewith; and the commercial direction of coal mining enterprises, may seem to be a distinction finely drawn, but we believe it is properly drawn. The distinction lies in the proper functions of government. It is right for a government to conserve the natural resources of a country. This course is now generally admitted not merely as a right, but is enjoined as a duty. The propriety of government control of industry—except in national emergency—is the most debateable thing on earth, but it is not admitted in those civilized countries that have achieved political stability.

The Anniversary of the Armistice

A year ago silence came over the fighting fronts in France and Belgium, where for over four years the noise of the guns did not cease, and where the battle line swayed east and west, the final battles ending where the first tremendous battles of August and September, 1914, commenced.

The Germans were defeated by superior forces, on land and on sea—but chiefly on sea, but these forces were not more overwhelming than those that sought desperately, but vainly, to break the allied line in 1914 and again in 1918. Had the German armies been waging a defensive war, as they told the world they were; had there been any threat to the national independence of the German peoples, such as the threat of the German leaders against Belgium in 1914, the German hosts could have fought a bitter fight for many months, maybe years, to come, but the heart had gone out of the German soldiers. Theirs was a cause that only victory could justify, and defeat brought the disclosures which made plain the insincerity of the German leaders. No man fights well when he discovers that, instead of fighting as he supposed for hearth and home, he has been the dupe and accomplice of thieves and liars.

Early in the war, Hilaire Belloc likened the German machine to a glass rod. Steady pressure, he said, on a glass rod produces no visible effect, no bending, no apparent weakening, until, suddenly, the rod breaks, and breaks irremediably, suddenly and once for all. And so it proved. The inherent rottenness of the German cause, without minimizing the military effort and bravery of the allied armies, contributed to the suddenness and irremediable character of the German debacle.

Peace, unfortunately, did not come with the Armistice. The Russian people, also deceived by those who had been entrusted with the equipment and the command of the Russian armies, were overwhelmed by the bitterness of utter defeat, and between rage, despair, ignorance and the apathy of poverty and disease, fell a prey to the false prophets which the German leaders themselves conveyed into Russia and assisted in their destruction of all that remained of Russian national strength.

The Bolshevists, like one of whom it was said: "they made a wilderness and called it peace," have made of Russia a Hell, and have called it Heaven. These men have puzzled the world by studied hypocrisy. They have committed the ordinary crimes specified in our criminal code, and have called their action political, thereby deceiving many good and earnest men. They have called murder "national safety," rape they have termed "eugenics," and to ordinary criminal actions, usually punished by the scaffold, they have applied the nomenclature of Christian ethics and philosophy.

The German failed because his system was founded on original error. For the same reason the Bolshevistic conception will fail. The world is not yet convinced that the false leaders of Germany have seen the final consequences of their misdeeds, nor whether the dregs of defeat which that misguided country has yet to drink may not cause, even yet, popular excesses which may rival the unhappy events of the past two years in Russia. This is a possibility which is not the concern of Germany alone.

Progress in the Northern Manitoba Mineral Belt

(R. C. WALLACE)

The summer of 1919 has been one of prospecting, not of actual mining, in the Northern Manitoba mineral belt. There have been several reasons why capital has not been so extensively utilized in this field as merits of the properties would warrant. These reasons it is unnecessary to discuss here, with the exception of the all-important and fundamental one—the lack of railway facilities. For gold properties such facilities are almost necessary: for copper properties they are indispensable. The stage has now been reached in the district generally where, with the building of a railway to the Flin-Flon property, mining would become active throughout all the western half of the belt, and the eastern section would undoubtedly be affected by the movement. As a business undertaking, the building of this railway should be viewed with favor, more particularly if the railway be projected to run through the greater part of the western belt: as a national undertaking to assist the liquidation of Canada's debt it should not be longer delayed.

In reviewing the situation in the mineral belt, it will be advisable to deal with the districts seriatum. They may be taken in the following order (from west to east):

1. Flin-Flon and Schist lake district.
2. Athapapuskow lake district.
3. Copper and Brunne lakes district.
4. Herb and Little Herb lakes district.
5. Other districts.

While there is a variety of mineral deposit in each district, there is also on the whole a certain definite type of mineralization peculiar to each restricted area. A discussion of the fields by districts is therefore logical, not only from the geographical standpoint, but to a certain extent from the standpoint of mineral distribution as well.

1. The Flin-Flon and Schist Lakes District.

This, the most westerly area, situated almost on the boundary line between Manitoba and Saskatchewan, is the most widely known part of the belt, owing to the fact that the Flin-Flon property and the Mandy mine are situated within its limits. On the Flin-Flon, since the diamond drilling operations were completed last summer, negotiations have been pending, but no further work has been done. The conclusion of a deal with large eastern interests is expected, and, we trust, will not be longer delayed. A railway will then be built, and a mining camp established. It will then, also, be possible, apart from the 20,000,000 tons of ore which the Flin-Flon property will furnish as a minimum, to renew mining operations on the Mandy mine, in which the mixed copper-zinc sulphide ore left in the mine after the lens of high-grade chalcopyrite had been excavated will furnish additional tonnage to the smelter. In this district prospecting has been directed mainly to the discovery of further bodies of copper ore.

At the north end of the north-east arm of Schist lake sinking is now being done by Greenlees on the Levasseur claim, where, in a seven-foot zone of sheared [illegible] work has considerably heavier chalcopyrite than at the surface. From the inclination of the walls there is a reasonable chance that this may represent the north end of an ore body pitching southwards underneath the lake. The intention is to sink fifty feet vertically, and to drift southwards in order to follow the ore body along the strike if it is intercepted at this depth.

On Hook lake also, immediately west of a small bay on the west shore of the lake, the group of prospectors who staked the Flin-Flon have done some work on four stringers of fairly rich chalcopyrite, no one of which exceeds three inches in width, dipping 80 deg. west. At the bottom of a pit nine feet deep one of the stringers flatten out in the northeast corner of the pit, and a good deal of chalcocite occurs in this lens associated with the chalcopyrite. The sheared zone in which the stringers appear in the porphyry has been followed for some distance in a somewhat irregular course, and can be traced by the showings of the green and blue copper carbonates throughout.

On the west side of the northeast arm of Schist lake, and on the east side of the main arm of Phantom lake, iron sulphide bodies have been prospected, which may be taken as typical of the most extensively represented form of mineralization throughout the whole mineral belt. In these, as in all other cases, the lead is a carbonaceous schist impregnated with pyrite and to a minor extent pyrrhotite, with occasional showings of chalcopyrite.

On the Three Nations and Surprise claims, Schist lake, the trenches show a total width of seventy-five feet, with an additional twenty-five feet of rusted rock untrenched. Within this are bands of quartz much less heavily mineralized.

On Rosen's property on Phantom lake a fifty-foot cross trench has been made across a similar band of mineralization. In the immediate vicinity, and more particularly at the south end of the lake (Wonder claim), quartz veins show pyrite, a little chalcopyrite, and somewhat abundant molybdenite.

2. Athapapuskow Lake District.

On the Chica property the eighth hole is now being drilled. On the cross-trenches on this property, which is a sericite schist and porphyry at the granite contact, and flanked on the east side by a band of conglomerate, fairly abundant pyrite is seen in the schist with but little showings of copper sulphide. The dip is steeply westwards, and the drill-holes, which are now being put down across the strike from the west, are inclined at sixty-five degrees. This single claim is now being projected for the third summer in succession.

East of the rapids, near the Pine Root river, and along the shore of the lake, trenching and tunnelling has been done on a series of claims staked on iron sulphide bands striking northwards, intimately asociated with granite, and in which are scattered showings of chalcopyrite.

From the north end of the north arm, on Thompson lake, a vein of mixed chalcopyrite and pyrite has been [illegible] system.

Trout and Tartan lakes north of Athapapuskow lake area, and at various points along the Hudson Bay railway as far as Manitou crossing on the Nelson river.

* See Canadian Mining Journal p. 731 issue Oct. 1st. 1919.

In these widely separated areas there is a variety of mineral occurrences, on none of which has extensive work yet be done. They fall into one or other of the three types already more fully described in the other districts:

1. Quartz veins carrying gold.
2. Copper sulphides, either in stringers in quartz or disseminated through the greenstone.
3. Iron sulphide dykes, with low values in copper, nickel, gold and occasionally platinum.

At the present stage it is unnecessary to enter into details in connection with any of these areas. With the exception of the Elbow lake district and the narrows between the first and second Cranberry lakes, little has been done beyond staking and stripping. The mere enumeration of the districts involved will indicate that attention is no longer confined by the prospector to the districts in the immediate vicinity of the original discoveries in the mineral belt, but that a wide field is now under exploration, covering practically the whole of the greenstone area in the belt.

General Conclusions.

(1) The work of the past five years may be characterized as very successful prospecting. In order that successful mining may ensue, railway transportation is essential. Until such transportation is provided, mining operations will be difficult on the gold properties and impossible on the copper properties in the western section of the district.

While the extent of the Flin-Flon property in itself amply justifies building a railway, it is very desirable, from the point of view of the mineral belt as a whole, that that railway should cross the belt east of Lake Athapapuskow and reach the property from the east, and in this way place a comparatively large section of the mineral belt in direct touch with transportation. When negotiations are finally concluded in the Flin-Flon property the building of the railway cannot be any longer delayed.

(2) While in the search for copper properties no discoveries have yet been comparable to the Flin-Flon and Mandy properties, prospecting has revealed a very widespread occurrence of copper sulphides throughout the mineral belt, and more particularly on the western section. There is therefore ample encouragement for still further and more detailed prospecting for copper ore bodies in the mineral belt and, in certain instances, for the expenditure of capital in the underground prospecting of properties already obtained.

(3) As far as gold mining is concerned, interest now centres more specially on unusually large gold-bearing quartz lodes and silicified zones on the Copper and Herb lake districts. Much money will require to be spent on the underground prospecting of these and similar large properties. With the stimulus which gold mining is now experiencing throughout the continent, it cannot be doubted that the money will readily be spent by such mining corporations as are desirous of acquiring ore bodies of large dimensions with sufficiently high surface values to justify underground prospecting on a large scale.

(4) Throughout the belt the iron sulphide bands are remarkable both in respect of distribution and width. Such bands have been cross-channel assayed only to a very limited extent. Because of their extent, and also because of the fact that fairly wide quartz lodes are here and there closely associated with iron sulphides, careful attention should be paid to these occurrences, in order to determine whether sufficient quantities of copper, nickel, gold and platinum are present in any such occurrence to make operations profitable on a mineral body of large dimensions.

(5)It cannot be too strongly emphasized that the staking of claims must be followed by, and indeed preceded by, intensive prospecting, if good results are to follow to the district as a whole. In certain areas the actual work done is as yet entirely incommensurate with the amount of territory which, being already staked, is no longer available for prospecting by anyone but the owners of the claims. The regulations with regard to staking and assessment work are very favorable, and not the minimum but the maximum of work will always be done on the claims recorded by those who keep the welfare of the district closely to heart.

DEPT. OF MINES PUBLICATIONS RECEIVED

Museum Bulletin, No. 29, Geological Series No. 36, "The Discovery of a Portage Fauna in the Mackenzie River Valley, by E. M. Kindle, and a "New Species of Pelecypods from the Cretaceous of Northern Alberta," by F. H. McLearn. Illustrated by plates.

The first report correlates fauna found in the upper Devonian of the Mackenzie section with the Portage of New York.

Mr. McLearn's report deals with new fossil species collected from the Colorado group, which includes the Pelican shale, Pelican sandstone and Lower la Biche formation in the Athabaska Valley, and the St. John and Dunvegan formations and the lower shale and Bad Heart sandstone groups of the Smoky River formation in the Peace Valley. The group of Lower Cretaceous Age embraces the McMurray tar sands, Clearwater and Grand Rapid formations in the Athabaska Valley and the Loon River and Peace River formations in the Peace Valley.

These two reports give more exact knowledge regarding the stratagraphical relations of districts in which much interest is now being taken because of their mineral resources.

Colored geological map of a portion of the Rex Group of claims at Wekusko Lake, Manitoba. Publication No. 1763, to accompany Memoir by F. J. Alcock.

Map showing the geological structure of the oil regions of Lambton County and adjacent portions of Middlesex and Keat Counties, Ontario, to accompany Part E. of Summary Report by N. Y. Williams, 1918. Shows oil pools and structure contours on top of Delaware (Corniferous) Limestone, with cross-section of territory from the vicinity of Perch on Lake Huron to Thamesville.

The greatest military power in Europe is without an army; the navy that menaced us is at the bottom of the sea. —Premier Lloyd George.

Did you buy your Victory Bonds?

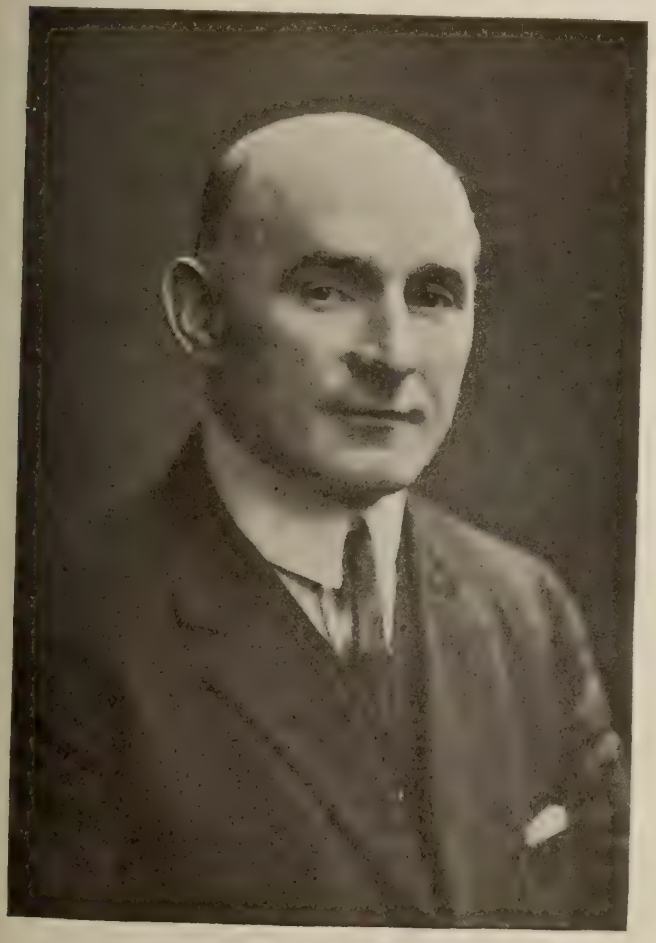
CANADIAN COAL MEN.

George Wilkinson, Chief Inspector of Mines for British Columbia.

Mr. Wilkinson comes from Cumberland, England, a county that boasts of Skiddaw and some of the oldest lead mines of the North Country. It is a country that pulls hard at the heartstrings of those who claim it as home, and in many respects the Cumberland man is not unlike the Cornishman, and enjoys a "la'al crack" about the tarns and moors and ancient mines that are its boast.

Born at Greysouthen in 1876 and commencing to work about a coal mine when thirteen years of age, Mr. Wilkinson received that most lasting of all educations, gained from actual experience in youth, and emigrated to British Columbia in 1896. He worked successively in collieries at Wellington, Vancouver Island, at Nanaimo for eight years, during which time he studied mining and passed for a first class certificate of competency as mine manager. After serving in the capacity of shotlighter and fireboss he became overman at the Protection Mine of the Western Fuel Company in 1904. After a year's service Mr. Wilkinson was appointed mine manager of the new Northfield Mine of the same company, filling the position for three years, when he resigned to accept the post of superintendent of mines for the Pacific Coast Coal Mines, a new company commencing mining operations on Vancouver Island. After the company had acquired holdings at widely separated points he was promoted to general superintendent in charge of all operations. After five years of hard work in this position Mr. Wilkinson was compelled to resign by ill-health. After resting for a time he engaged in consulting practice, and reported on many Pacific Coast properties. In 1914 he rejoined the Western Fuel Company's organization and was appointed manager of the Reserve Mine, then being opened near Nanaimo. After three years in this position Mr. Wilkinson was appointed Chief Inspector of Mines for British Columbia in 1917, and has also been chairman of the Board of Examiners for coal mining certificates of competency since the recent amendment to the C.M.R. Act of B.C. was passed. Mr. Wilkinson is also chairman of the Coal Miners Minimum Wage Board.

The duties of a chief mine inspector in British Columbia collieries are probably more varied than anywhere else, as the coal occurrences vary from highly inclined, thick and gaseous seams in mountain altitudes, with extraordinarily heavy overburden, to the more normally situated, but yet difficult seams of Vancouver Island, which, as is perhaps not generally known, include extensive undersea operations, and some conditions unique in Canada. In Mr. Wilkinson's home county is to be found the most extended undersea coal-mining operation in the world, so that in this respect he should be well able to advise on undersea mining practice.



GEORGE WILKINSON
Chief Inspector of Mines, British Columbia.

DR. W. G. MILLER BACK FROM ENGLAND.

Imperial Mineral Resource Bureau of British Empire is now thoroughly organized and under way.

Dr. W. G. Miller, Provincial Geologist, is back at his desk in the Parliament Buildings at Toronto, having just returned from a six months' stay in Europe. Dr. Miller's mission was to England where most of his time was spent in completing the organization work of the Imperial Mineral Resource Bureau, which was established about two years ago for the purpose of sizing up the mineral resources of the British Empire and to place them before the wrold. In an interview with the Canadian Mining Journal, Dr. Miller stated that the organization was now thoroughly under way and that already much had been done through the co-operation of the various countries of the Empire in bringing before those interested the mineral potentialities of the colonies and the mother country. A work at once to be undertaken is the issuing from time to time of publications containing descriptions and statistics of the mineral resources of the various countries and these will be widely disseminated, while the mining laws will also be incorporated for the general information of the mining industry. Although started in the last year of the war, the organization could do little, owing to the unsettled conditions generally, but the Bureau is now thoroughly established and excellent results are looked for.

While in England Dr. Miller took advantage of the opportunity to tour the battlefields of France and Belgium. Although the peoples of both countries are still stunned by the awful tragedy of the war, he says that reconstruction work in a number of districts is energetically being carried on. Living in France, he says, particularly in regard to food prices, is cheaper than in England.

DEVELOPMENTS IN MINING PRACTICE. AT THE HIDDEN CREEK MINE, B. C.

E. E. Campbell, Mine Manager at the Hidden Creek Mines of the Granby Consolidated Mining & Smelting Co. Ltd., has written an article explaining recent operations in these mines and new methods introduced to meet in a measure, the high costs resulting from the war.

He says:

The necessity of meeting the steadily increasing costs of labor and supplies, due to war conditons, presents many problems to the mine operator. At the Hidden Creek Mine of the Granby Company many changes were made in details of work, numerous economies were carried out in the use of mining materials, and improved equipment was installed in order to meet the continually increasing prices. The minor changes made during the latter part of 1915 and the first part of 1916 may be summarized as follows:

A Corps of Picked Men.

An accurate record was kept of all explosives used, and the consistent use of tamping in all first blasting was introduced. Specially picked men, receiving bosses' pay, were detailed to watch the powder consumption and to instruct inexperienced men in its proper use. Extensive experiments were made with the different kinds of rock drills, as well as with the different types of drill bits, which latter proved an important factor in increased drilling speed. A ban was placed on bulldozing as far as possible, and boulders were drilled that could be reached with safety. Centrally located pockets about fifteen feet square were driven from the 385 level or shipping tunnel, to embrace a large area of stoping ground above the 530 level, which eliminated the transfer of broken ore on this level. All pocket chutes were increased in width from three feet two inches to five feet eight inches, and a new haulage system was installed on the 385 level using cars of 130 cubic feet capacity with twelve-ton locomotives, instead of the former equipment of 75 subic feet cars and six-ton locomotives.

Improvement Shown.

While a marked improvement resulted from these efforts, the real operating problem was not completely solved, which is the handling of the broken ore from the first blasting in the stopes and glory holes, through the mine to the crusher plant.

The mineralized schist making up No.2 and No. 3 ore bodies drill fairly well and often breaks readily in very large masses. This is due to slips, seams and occasional small dykes cutting through the ore body. After these natural partings are broken the remaining large pieces are more resistant to blasting. To illustrate: A few months ago a piece of ground measuring 60x30 x20 feet, containing several thousand tons, was blasted down in the glory hole. It rolled at least 150 feet without breaking, and it required several days' drilling to break it fine enough to let into the pockets.

When the first central pocket was driven from the 385 level to the upper workings it was equipped with a manway at the lower end, which entered the pocket at a point about twenty-five feet above the chute. Here a big opening was made to make room for drilling large pieces before they reached the chute. Another entrance was made at a point where the pocket passes the 530 level. It was soon found that many large pieces escaped from the glory holes and stopes into the pocket before they could be drilled. These frequently blocked the pocket a hundred feet or more down. Dislodging these rocks entailed a great deal of danger to the men doing the work, as well as consuming an excessive amount of powder as it was impossible to use a drill in such a position, and bulldozing had to be resorted to. When the rock blocking the pocket was exposed from the top the usual procedure was to place the powder in a sack, light the fuse and lower the sack on to the rock with a rope. If this rock is covered up, as often happens, the only alternative is to use ladders to climb up from the nearest manway below, and place the bulldoze to the best advantage possible. There have been times when several cases of powder was used to clear a jam of boulders in one of these pockets.

Thus, at this stage the saving in tramming expected from these pockets proved more an expense than an economy. As soon as the work could be done, a manway was driven up beside the pocket from the 530 level to the top, with opening into the pocket at intervals of about thirty feet. Equipped thus, it was much easier to reach a blockade, but the amount of powder required to keep the pocket open was still excessive, and many pieces passing readily through the pocket were too large to go through the chute. These frequently had to be bulldozed at or near the chute, making big repair costs and wasting much powder.

Successful Experiments.

The next experiment was to pass the rock going into a pocket over a grizzly. At first the idea of having pieces of rock weighing fifty tons and more rolling on to a grizzly did not seem practicable.

The grizzly installation was made at the 530 level. A bulkhead was put in the pocket below the tunnel level. From a point below this bulkhead a raise was then driven, breaking into the bottom of the tunnel, and grizzly rails were fitted into this opening A second was then driven from above the grizzly back into the pocket. This latter raise diverted the ore out of the pocket on to the grizzly, and the lower raise returned it into the pocket again below the bulkhead. The pocket above this grizzly was further increased in size to lessen the possibility of blocking.

The grizzly rails are eight feet long and they are placed three feet apart. Although much difficulty was experienced in procuring rails that would stand up to such violent service, and the cost of renewals seem extravagant, the reduction in explosives and chute repairs, together with the advantage of uninterrupted operations, far surpass any of the disadvantages.

The rails now used are made up of two 125-lb. track rails bolted strongly together, and each is reinforced with a 1x5-inch flat iron strip riveted on to the bottom. The temper is partially drawn from these rails before using, as they are very brittle and break readily. Under ordinary circumstances these rails last from one to two weeks. It is probable that a more suitable rail can be procured when the steel market becomes normal.

OUR PHOTOGRAPHS OF THE PRINCE OF WALES AT COBALT.

The 'Journal' omitted to mention in the last issue that the excellent photographs of the Prince of Wales taken on the occasion of his visit to the Cobalt mines. were taken by the MacLean Studios of Haileybury, Ont. We saw a number of additional views of the Prince during his Cobalt visit, taken by the MacLean Studios, to whom we have pleasure in referring such of our readers as may desire to obtain original prints for framing.

OIL PROSPECTS IN BRITISH COLUMBIA.

Developments in the Southern Coast Section of the Province and in Southeast Kootenay.

(From our Victoria Correspondent.)

From Eastern Canada comes the report that an organization calling itself the Amalgamated Oil Company, Limited, after obtaining satisfactory reports from the Government and other geologists, has acquire considerable holdings in Southeast Kootenay to the end that the ground may be thoroughly prospected for oil. The company claims to have acquired a lease of 30,000 acres in the vicinity of Sage Creek, the said lease giving the Company the right of acquiring complete possession through Crown Grants at a costs of from $10 to $20 an acre.

The Company has leased to the Crow's Nest Oil Company of Spokane and their associates 4,886.5 acres on a royalty basis, with option to this Company to purchase at $500 an acre. This Company is drilling and are now down 1800 feet on one well.

Negotiations are in progress with one of the strongest United States Companies towards leasing half of the balance of the Company's property on a royalty basis, also with an option to purchase at $500 an acre. Both these leases include an obligation of the lessee to do certain development work. The Company at present does not propose to operate, but will await the results of the development work being done on the property by the lessees.

The following paragraph from the prospectus explains the attitude of the promoters:—

"The business of looking for oil is always a speculation. There is nothing new in this statement, and the public know it as well as the directors. The directors, however, believe that they have obtained the best advice available, and feel confident that their programme will result in what they consider one of the best prospects in Canada receiving a thorough testing.

"The indications of oil and gas at depth have been reported as most satisfactory, and analyses show that oil to be of extremely high grade and its value much higher than the average. Should oil be found in commercial quantities not only the shareholders but the whole country will benefit."

Note:—It has been ascertained in Victoria that the consolidation under control of one organization of leases to land in Southeast Kootenay held by individuals and by companies is in process. These leases in many instances were issued years ago and prospecting for oil in some cases was undertaken. Not a few are in arrears in payment of Government fees, action against the owners having been held up by the terms of the Relief Act which was brought into force for the duration of the war. With the war over no doubt steps will be taken, in due course, to secure delinquent payments. Should an application be made for the assignment of one or all of these leases to such a Company as is mentioned in the foregoing article, accompanied by moneys due, it is likely that it would be granted. There is no doubt that the Government would welcome the thorough prospecting of these lands for oil or for any other natural resource the the discovery of which would be an asset to the country. There also is no doubt that the district in question is considered by some authorities as a possible oil producer.

Oil prospecting has been rousing considerable interest throughout the southern coast sections of the British Columbia mainland during the last few months. A number of companies are engaged in drilling and in one instance some success is reported. The Boundary Bay Oil Co., which is operating near Boundary Bay, has been drilling since last August and is down about 750 feet. At 686 feet a flow estimated at between 6 and 8 barrels a day was struck and it now is reported that oil is flowing at about 25 barrels a day. This latter is through a test hole of 2½ inch diameter, projected beyond the 16" hole and it is expected that oil will be tapped in commercial quantities when the 16" pipe is through to the present depth of the test hole. The Empire Oil Company is drilling in the vicinity of Langley, B. C. and is down about 1,100 ft. A slight showing of oil is said to have been encountered. The Pitt Meadow Oil Company has run a 6-in. test hole about 2,000 feet while the Spartan Oil Company, in the Burnaby District, close to Vancouver, is down about 2,000 feet with a test hole and is reported to be planning the commencement of a commercial sized hole.

THE PETROLEUM POLICY OF ENGLAND.

Petroleum, as is well recognized by students of the subject, is the most important basic factor on which pivots future military and commercial power. It has long been recognized that the wealth and power of a nation have varied in direct proportion to its coal and iron resources (granting that it retained control). That was the fundamental truth of the Age of Steam and the use of coal as the highest form of fuel. Now, however, we are in the first flush of the Age of Gasoline and fuel petroleum, and oil outranks coal in immediate strategic importance. The petroleum resources of the world are mainly under the control of two great powers, both Anglo-Saxon—England and America. The latter predominates at present, because of the vast oil resources which have been discovered within her own boundaries, and because of the organizing genius of her private business concerns. The control of England is growing by leaps and bounds, because of a fixed national policy and, to a considerable degree, of direct government ownership and control.

America has had no government policy regarding oil, since the government dissolved the Standard Oil Company. Since then the warfare against great and powerful business combinations has been neglected, but nothing new has been developed. England on the other hand, apparently taking a lesson both from the threat and example of Germany, has frankly adopted the opposite plan, of encouraging and even forming great oil monopolies, under government auspices. The power of this organized efficiency with the great strength of the British government behind it, as compared with the weakness involved in the negligent policy of America, needs no explanation; and the result is that we must acquiesce in the prediction of various conservative American petroleum experts that before long the preponderant control of the world's petroleum, and with it the military and commercial domination of the world, will pass to Great Britain; and that if the United States sits down to the table of equal political and commercial power anywhere in the world, even at home, it will be by favor of England's request only.

These facts have been known for a long time in private as well as government circles; there is no secret about them, and the magnitude of England's official program in this respect is so great that it could not be concealed, even is she so desired.

We shall soon present an article written by an author whom we know personally, and who states a few plain facts and inferences as plain. The author is in a position to know absolutely that of which he speaks.

This British petroleum policy, it will be shown, is frankly nationalistic and imperial, and bluntly discriminatory, against the United States in particular and all other powers in general. This is part of a similar nationalistic policy in regard to other minerals, the details of which we shall point out from time to time. Plainly, as we stated above, England desires to profit both by the threat and lesson of Germany. Plainly she is determined that no other nation, Anglo-Saxon or otherwise, shall again put her with the extreme danger to which carelessness regarding Germany's schemes and methods submitted her. Her solution for the future, as to plan, is to dominate the world, not only by her old device of a twice preponderant fleet, but by political and commercial control of the fundamental mineral resources of the world so far as possible. Her solution, as to method, is to adopt the efficient German system of state controlled monopolies; and to further safeguard herself by discriminating against non-British investors.

This program was evident during the war, when the nationalistic sentiment was perforce stiffened, as in other countries, by the necessity of strengthening to match the unhealthy German nationalism; and was between friends and partners. America must not submit to be put in such a position as to risk being told by England that such a talk is unnecessary, since she has arranged matters with entire satisfaction to herself. There has been and is much talk of American world domination, which is as indiscreet as England's present policy. Partners in the world's wars, peace, and business must not seek to eliminate or dominate one another, but to divide activities, responsibility, and profits equably.

Meantime, in view of America's sluggishness of insight and action, we can hardly blame England's vigorous and progressive nationalism (we believe it to be fundamentally against the Teuton and not primarily the American), so much as we do America's inactivity; and the firm yet fair method of joining issue with England in regard to her discrimination, in those countries which she controls, against American progress in the ownership and control of petroleum, would be to adopt corresponding retaliatory legislation, thus putting each on an equal footing as business rivals, but making it clear that we prefer that both should abandon selfish and domineering methods, and become true partners instead. In the shoulder to shoulder forward march of America and Britain, we firmly believe, lies the hope of the world; and not less important is the preservation of the dignity, independence, and power of America.—Editorial in Engineering and Mining Journal.

One big trouble with the labor movement is the fact that we have too many cabooses and not enough engines.—Railroad World.

INDIAN PETROLEUM.

A theory is being discussed in British India that oil-beds exist continuously along a belt stretching from Burmah in the east to Roumania in the west. Should the fact be eventually established a discovery of the very highest importance will have been made, for the belt, according to "Indian Engineering," will lie wholly on the Indian side of the Himalayas.

At present, however, only uncertain indications have been found, the latest of which have been discovered by Mr. Middlemiss, who is at present superintendent, Mineral Surveys of Kashmir. He has not so far actually found oil in Jammu Province, but has located geological conditions pointing to the existence of a natural reservoir of a type giving good promise of a store of oil, being in all respects similar to oil yielding structures in the neighboring Rawal Pindi plateau. In the latter region oil had long been known to be present, but efforts to obtain it in quantity were unsuccessful till the Khaur oilfield near Pindigheb was at last located.

AN APPRECIATION OF THE SCHOLARSHIP OFFER OF THE INTERNATIONAL NICKEL CO OF CANADA.

Mining and industrial companies have made great strides during the last decade in the way of caring for their employees, but it has remained for the International Nickel Company of Canada to introduce a new departure, in the form of three annual scholarships for a complete four years' course leading to a degree in science in the universities of Toronto, Queen's, or McGill. The scholarships, which cover all expenses while attending the chosen university, are awarded on the result of competitive examinations among the minor apprentices and sons of employees in the mining and smelting division, which has its headquarters at Copper Cliff, Ontario. The first of the annual examinations has already been held, so that the successful candidates may take advantage of the coming academic year. It will be observed that after the fourth year the company will be paying the expenses of 12 students continuously. So far as we know, this gift is unique, but it is the sort of thing we should have expected from the International Nickel Company, which has already blazed an honorable trail for notably generous dealings with its employees and to increase their well-being. The effect of this gift upon the ambitions of its workmen will be great, but we venture to suggest that the effect upon the mining profession may be even greater. Many of the finest miners and smeltermen we have today were recruited from the ranks of what, for a better term, are often called 'practical' men.' The 'school of hard knocks' develops character of a kind that is often denied those whose earlier years are surrounded by more luxury and less industry. Young men who have toiled hard for their living and who know the disadvantages of lack of training, upon winning a scholarship of this kind will take up their technical course with a full understanding of its benefits, an ability to correlate theory and practice, and an energy that will not let slip any opportunity for acquiring a thorough knowledge of their work. We should advise those that tread the softer path to 'watch their steps;' it is probable that in a few years these lusty young sons of the stope and the blast-furnace will be looming large in the mining profession.—Mining and Scientific Press.

Manitoba Correspondence

Brooklyn.

At the Brooklyn mine, Gold Lake, Manitoba, drifting is in progress at the 100-ft. level. Work was started on this property in March and good progress has been made in spite of transportation difficulties. The owners are for the most part residents of Buffalo. Mr. Bert Clarkson is president of the company and Mr. A. L. Anderson is superintendent.

McDonald Claims Sold.

One of the outstanding figures of the Rice Lake district was Angus McDonald, who was accidentally killed by a hunter in September. Mr. McDonald had secured control of several claims in the area before the war. He went to the front and came home safely after three years service there only to be shot in the woods in mistake for a moose.

Quite recently the McDonald properties have been purchased by a syndicate headed by Gordon McTavish. It is expected that development of some of the properties will soon be undertaken by the new owners.

Financing the Gold Pan Mine, Rice Lake.

Many of the readers of the "Journal" have heard of the Gold Pan mine in the Rice Lake district, east of Lake Winnipeg. From it has been taken some of the richest gold ore ever mined in Canada, and specimens rivalling those of the Croesus have found their way to many cities here and in the United States. The development work done indicated that a very important ore deposit had been found; but the property has been for some time idle and the finances of the company in bad shape. Considerable interest will be taken in the recent re-organization of the company and in the method of financing.

There is now being offered to the public 200,000 shares of 8 per cent preferred stock. This stock in addition to earning interest at a fixed rate carries as a bonus the earning power of three shares of common stock for every preference share issued. The first profits of the mine will be devoted to the repayment of both capital and interest. Then the holders of the preferred stock will share with the holders of the common stock any further profits. The company has 400,000 shares in the treasury which will be issued as preference shares.

The officers of the Gold Pan Company now are: Jas. H. Ashdown, president; F. O. Fowler, vice-president; Gordon McTavish, secretary-treasurer. The other directors are E. F. Hutchings, S. Hart Green and Sam Scott. J. B. Tyrell of Toronto is consulting engineer.

It is expected that development of the property will be carried on rigorously this winter. Mr. Tyrell visited the property recently in company with Secretary McTavish. Mr. Frank Phillips has been appointed mine superintendent.

An Early Freeze Up.

Cold weather descended unusually early on the Rice Lake district this year. Lake Winnipeg is frozen over and the water route from Riverton to Manigotegan and thence up the river to Clearwater Lake is no longer usable. As soon as possible the winter road from Fort Alexander will be made passable for teams. There is no summer waggon road to the district.

Bruce Consolidated.

The Bruce Consolidated Mining Co. owns 275 acres in the Gold Lake area, Manitoba. Development has been recommended by J. S. De Lury of Winnipeg. The directors are Col. Wm. Grassie, Col. E. D. Alderson, Capt. W. B. Tobias, Dr. Halpenny and J. J. Papineau. Col. Grassie is president of the company.

THE POSSIBILITIES OF NORTHERN QUEBEC ALONG THE ONTARIO BORDER.

By J. McRAE.

In connection with the development of that part of the province of Quebec lying adjacent to Ontario, and extending from Mattawa on the south, north to the National Transcontinental Railway, a new era appears to be opening up.

Heretofore, this part of the province of Quebec has been left for the small pioneer, the settler, to develop. Some progress has been made in agriculture, but in this way only that fringe of territory lying adjacent to the Ottawa river and Lake Temiskaming has been opened up.

The construction of the great plant of the Kipawa Fibre Company, a subsidary of the Riordon, at Lumsdens Mills near the south end of Lake Temiskaming, marked the beginning of more intensified development. The plant which is being completed this month, and which is served by the C.P.R. Railway, has been constructed at a cost of around $4,000,000.

Now comes the unofficial report that the Canadian Pacific is considering the advisability of extending the Kipawa branch to the northward, for the time being to terminate near the north end of Lake Temiskaming. The distance, as the crow flies, is about 56 miles, but would perhaps necessitate the construction of 65 miles of line. The road would pass through a comparatively prosperous farming and lumbering district.

Incidentally, and no doubt having vital bearing on the final decision to be reached by the C.P.R. is the likelihood of another huge pulp and paper mill to be erected near the north end of Lake Temiskaming in close proximity to the Des Quinze water power. It is learned that a more or less complete survey has been made of this great water power, estimated to be sufficiently large to generate all the way from 100,000 to 250,000 h.p. and ranking among the largest in the Dominion, with the exception of Niagara. The M. J. O'Brien, Limited, a twenty million dollar corporation controlled by Senator M. J. O'Brien, of Renfrew, owns several hundred miles of territory located along the waters of and tributary to Lac Des Quinze. The same interest controls a large part of the Des Quinze power. It is believed, therefore, that the Canadian Pacific and the O'Brien interests are working together with a view toward realizing mutual benefit from the further development of this area. From Lac Des Quinze, extending away to the north and to the west is territory which as yet is practically untouched. It is an area hundreds of miles in extent, and presenting an almost unbroken mass of timber, broken at intervals by grey-rocky hills rising up through the green timberlands. The potentialities, in addition to its known tremendous value, are enormous. Geological conditions are such as to encourage the belief that deposits of precious metal will be found to occur throughout the area. The northern reach of the C.P.R. at Kipawa is on the threshold of this great new land. By extending to Lac Des Quinze it will have made the first stride in one of the greatest of the remaining opportunities at Empire-building, and would command, unchallenged in competition a territory, vast, and containing untold wealth.

Our Northern Ontario Letter

The Silver Outlook.

With the quotations for commercial bar silver continuing on an upward trend, and with an unfavorable rate of exchange between Canada and the United States, students of finance appear to be growing apprehensive lest is shall be found necessary in Canada in the near future to enact legislation similar to that now in force in Great Britain—making it a criminal offense to melt down silver coin, and placing an embargo on silver exports.

It is perhaps too soon to grow alarmed over the situation, for the reason that the point of bullion parity with the value of the coin has no yet been reached but, in a world suddenly possessed of insatiable desire for silver, a recession in quotations appears to be remote, while, on the other hand, continued demand may reasonably cause a further upward swing. Believing in preparedness, therefore, it seems quite reasonabe that students of finance as well as metal authorities should give the matter the thought necessary to enable them to meet any emergency that may arise.

The high grade mines of Cobalt are deriving the maximum benefit from the present favorable situation. The mines are fully named; efficiency is increasing; costs are declining, and the margin of profit on every ounce of silver produced at the leading mines is greater than the total value of the product a few years ago.

According to figures just obtained from Arthur A. Cole, mining engineer for the Temiskaming and Northern Ontario Railway, which road serves all the productive precious metal mining camps of Northern Ontario, the total ore shipments from Cobalt during 1918, which figures will be contained in an annual report soon to be issued, amounted to 17.911 tons; this being in addition to the large amount of ore treated in local reduction plants. During the year 22 mines shipped ore, the heaviest shipper being the Buffalo with 3,842 tons to its credit, followed by the Nipissing with 2,619 tons and the Mining Corporation of Canada with 2,264 tons. Up to the end of 1918, the mines of Cobalt shipped an aggregate of 266,734 tons since the discovery of silver in 1903. The total silver production up to the end of 1918 amounted to 292,056,976 ozs. valued at $169,241,387.

As near as can be ascertained, the silver output at present approximates $1,250,000 every thirty days, the Nipissing being the chief producer, being responsible for upwards of one-fifth of the total.

At the time of writing a number of important mining deals are being negotiated. Chief among these are the Buffalo Mines, and the old Drummond property. The Mining Corporation is stated to be making a bid for the Buffalo, following the failure of the Temiskaming Mining Company to secure the Buffalo on satisfactory terms. Montreal interests through the former leaseholders of the Foster-Cobalt mine are negotiating in an endeavor to secure the old Drummond mine. In neither case have negotiations as yet reached successful consummation.

At the Beaver Consolidated, some of the richest ore ever found in the mine is being encountered. In addition to a substantial quantity of high-grade, a large amount of low-grade material occurs in close proximity to the vein.

The La Rose Consolidated is stated to be enjoying a prosperous year. Recent shipments of high grade ore have been made, one car unofficially estimated to contain a value of upwards of $75,000. The outcome of the boundary dispute which arose last spring between the La Rose and the O'Brien, regarding which a legal decision was reserved, is still unsettled. A decision is looked for at an early date.

The Nipissing, Mining Corporation, O'Brien, Temiskaming, Crown Reserve, Kerr Lake, and, in fact, practically all the leading producers have scouts in the various mining districts in search of prospective mines. Backed by ample finances, and with excellent managerial organizations built upon more than a decade of successful experience in Cobalt, not a few of these companies are expected to prolong their life indefinitely through the careful selection of other possible paying mines.

Among the properties in Cobalt which have lain idle for a number of years, and which are being operated, might be mentioned the Farah, now known as the Nipissing Extension and the Oxford-Cobalt, a prospect situated south of the Kerr Lake and in the Gillies Limit. Others of the small prospective properties being worked include the Silver Cliff and Foster-Cobalt, while among those likely to be explored or developed at an early date are the Hylands property, to be known as the Victory Silver Mines, and the Silver Hills property, in the north-western part of Coleman township. With these might also be mentioned the old Drummond property, provided present negotiations terminate successfully. Also, presuming that the legal details can be arranged, the Bailey-Northern Customs, (a merger of the Northern Customs Concentrator, Ltd., and the Bailey-Cobalt) is expected to commence operations on the Bailey.

Regarding the affairs of the Bailey, the matter came up before Mr. Justice Middleton on Nov. 5th in Toronto, and at the request of the parties involved, the motion was enlarged until Nov. 19th.

The shareholders of the Tretheway-Cobalt, at the annual meeting held in Toronto on Nov. 7th ratified the proposal of the directors to acquire additional shares in the Castle property in Gowganda on a basis of one share of Tretheway for two shares of Castle stock. The deal to secure the Major property, which adjoins the Castle, and to acquire a lease of 112 acres lying under Miller Lake was also ratified.

It is quite evident that a continuation of the present high quotations for silver will be find practically all the prospective, but idle properties receiving renewed attention, and, in the aggregate, adding considerably to the extent of the silver mining industry of Cobalt.

The Nipissing mine is producing at the greatest rate in its history. The present record according to official advice is at the rate of over $500 an hour or about $12,105,75 every twenty-four hours. At such a rate for one year the output would amount to over four and a half million dollars.

According to the report of manager H. Park to the president and directors of the company, the mine during the month of October produced ore of an estimated value of $375,247, and shipped bullion and residue from Nipissing and custom ores of an estimated net value of $680,208.

Concerning development work, Mr. Park says:—"Underground work is now nearly back to normal. At 73 shaft, development and exploitation is proceeding at four levels. The fifth level will soon be dewatered, which will make 544 winze workings accessable. All operations at 75 shaft were satisfactory throughout the month. One of the cross-cuts at the third level encountered the extension of a known vein, No. 3006, some of the ore being of exceptionally high assay; the width averaging one inch.

"Exploration and drifting was carried on at the second level of 64 shaft. About 60 tons of low grade ore from old surface dumps are daily being sent to the low grade mill. Exploration is being carried on at two levels of 63 shaft. One of the cross-cuts will eventually connect with the lower workings at 96 tunnel. Drifting on vein 109 at a depth of 90 feet below 96 tunnel is about completed. Results of this drifting show the vein to be narrower and lower grade than at the tunnel level; the formation however is different. A cross-cut is also being run to vein 99, the intervening country being considered first class area.

"The low grade mill treated 7,674 tons. The high grade plant treated 230 tons. The refinery shipped 403,830 fine ounces of bullion. The following is an estimate of production for October:—

Washing Point	$127,065
Low grade mill	248,182
Totals	$375,247

Ore Bullion Silver Shipments from Cobalt

During the week ended Nov. 7th, four Cobalt companies shipped an aggregate of seven cars containing 613,548 pounds of ore. The Buffalo with two cars containing 187,308 was the leader, as shown in the following summary:—

Shipper	Cars	Pounds.
Buffalo	2	187,308
Coniagas	2	132,170
Mining Corporation	2	130,060
O'Brien	1	64,010
Totals	7	613,548

During the corresponding period, the Nipissing and the Mining Corporation each shipped bullion, the total amounting to 93 bars containing 113,683 fine ounces, made up as follows:—

Nipissing	60	80,811
Mining Corp.	33	32,872
Totals	93	113,683

The Gold Mines.

A new vein encountered during the past week at a depth of 1500 feet in the Pearl Lake shaft of the McIntyre-Porcupine promises to be important. The ore came into one corner of the shaft, and at the time of writing the extent of the body and its average gold content is not known. The ore, however, appears to be of high grade and seems likely to develop into an important find. This is the deepest point to which mining operations have been carried in any of the gold mines of the province and is pointed to as corroborating the contention of mining men that the Porcupine deposits are deep-seated, and, in some instances might reasonably be found to continue to depths beyond which mining may be carried. It holds out untold promise to the gold mining industry of this country.

The Hollinger Concolidated, with a surplus already crowding close to $3,750,000, with ore reserves according to estimates at the beginning of the year amounting to around $41,000,000, with milling facilities for treating a maximum of 3,500 tons daily, ore averaging between $8 and $9 to the ton, developed to a depth of close to one-quarter of a mile and having at least two-score known ore bodies as yet undeveloped in addition to those being worked is gradually standing out as likely to make a strong bid for world leadership among gold producing mines.

The Dome Mines at its present rate is earning sufficient to cover dividend disbursements at the rate of 20 per cent annually, is the advice given your correspondent by an official of the company. A dividend of 50 cents a share is expected at the beginning of the new year.

On the Dome Extension, arrangements are being made at the 600-ft. level to stope out considerable ore to be treated in the Dome Mill. The result of treating a substantial and representative tonnage of this ore will have a vital bearing on the question of whether or not the Dome will exercise its option on the Dome Extension on or before March, next, on a basis of one share of Dome for thirty shares of Dome Extension.

Among the important properties about which very little has been said during the past year or so is the Schumacher and the Porcupine V. T. N., both properties equipped with large mills and having quite large ore reserves. It is believed that both of these properties will be whipped into shape for operation before very long.

At a meeting of the Gold Reef shareholders held in Toronto, Nov. 7th, the company was authorized to increase its capitalization from $1,000,000 to $3,000,000. This move was made advisable owing to the plans to finance an exploration and development program in addition to the present diamond drilling campaign. The fourth diamond drill hole is now being drilled.

On the Clifton-Porcupine, work is proceeding in an aggressive way, and officials declare that results are satisfactory.

The Porcupine-Kenora is to be developed by underground work, following the encouragement met with as a result of extensive diamond drill tests made.

On the Big Dyke property (formerly known as the McRae-Porcupine), situated in the township of Delora, plans are being arranged to sink a shaft to a depth of 300 feet. Up to the present about $40,000 has been spent on exploration work on this property, on a large sulphide dyke in which occurs a large amount of sugar-quartz and iron sulphides. Low gold values occur throughout the dyke.

The Kirkland Lake camp is gradually becoming more active. According to reports emanating from Buffalo, it is believed the Wright-Hargreaves will absorb the Sylvanite company. The property of the latter company lies directly between the Wright-Hargreaves and the Tough-Oakes. Previous work consisted of the installation of a small electrically driven plant, and the driving of a shaft to a depth of 100 feet at which point two veins were opened up, one of which, though fairly narrow contained considerable ore.

The proposed scheme to construct light railways to the outlying camps is an interesting subject to the Kirkland Lake camp. Any concrete progress made is being watched with keen interest, as it is thought that

in addition to the present macadam road from Swastika to the mines, a light narrow gauge railway might prove to be an added convenience.

In the Fort Matachewan district the Matachewan Gold Mines has commenced diamond drilling, and in a general way is speeding up operations. A saw-mill has been erected and is turning out lumber for building purposes. Also, the government is assisting in the clearing of a right of way which is to constitute the winter road from Elk Lake.

The Robb-Clemmens group of claims have been optioned to the Smith-Norrington interests, and arrangements are now being made with diamond drill contractors to commence work just as soon as the drill can be transported to the property.

Miner Versus Farmer.

Mining interests and business men in general are evincing more than usual interest in the present political situation in Ontario. With the United Farmers of Ontario claiming a larger number of members in the Ontario legislature than any of the other parties, yet not being able to claim a substantial working majority, the naming of the ministry on November 14th the date on which E. C. Drury, leader of the U.F.O., has agreed to take over the reins of government, is being awaited with deep concern in the northern districts where it is feared the mining districts will not be given cabinet representation. Suggestions have been made to the effect that the interests of Northern Ontario and Southern Ontario are so different as to make it quite reasonable to consider dividing the province in two. For the greater part, these suggestions are put forward in a friendly spirit, as tempered with caution, and plainly marked with a desire to avoid undue embarrassment to the present provincial government.

A REVIEW OF THE PRODUCTIVE STATUS OF THE GOLD MINES OF NORTHERN ONTARIO.

By J. A. McRAE, Cobalt.

In an endeavor to give your readers a correct view of the status of the gold mining industry of Northern Ontario, your correspondent has secured official figures upon which to base this summary.

During 1918 the average gold content of the ore treated in the Porcupine district amounted to $9.60 a ton; in Kirkland Lake $11.89, the average in these two leading camps being $10.74 a ton. The smaller and outlying districts now coming into more or less prominence appear likely to equal this average, although, perhaps containing less total tonnage than the camps mentioned.

It will be noted from the table below, that the gold mines of Northern Ontario are at present equipped with facilities for treating a maximum of approximately 6,810 tons of ore every twenty-four hours. The maximum output, therefore, estimating ore at $10.74 a ton, would approximate $73,139 daily, or about $26,695,881 annually.

In dealing with these figures, it would perhaps be well to point out that all but six of the nineteen mines below referred to are beyond the prospective stage. Those in the latter class only include the Davidson, Newray, Associated Goldfields, Argonaut and Hill Gold-Mines. It will be noted that the six mines in the prospective stage account for but a small part of the total milling equipment, and leaves 6,640 tons daily capacity as representing the equipment of thirteen proven mines, which on ore averaging $10.74 a ton would produce a maximum of over $26,000,000. Also, in eliminating the above mentioned half dozen mines, does not necessarily infer that they will not each in time attain commercial success.

Another factor, without which this summary would be incomplete, is the proposed plans at a number of properties for the installation of additional equipment and in some instances the erection of new mills, all of which would serve to increase the total.

In presenting these facts, it might be stated that the following mines are in operations, the others being closed due to labor shortage: Hollinger Co., Dome, McIntyre, Porcupine-Crown, Dome Lake, Davidson, Kirkland Lake, Teck-Hughes, Lake Shore, Miller-Independence, Argonaut, Associated Goldfields.

Following is the maximum capacity of the present mills:

Company.	Daily Capacity in Tons	
Porcupine District.		
Hollinger Con.	3,500	
Dome Mines	1,500	
McIntyre-Porcupine	550	
Schumacher	200	
Porcupine Crown	130	
Porcupine V.N.T.	120	
Dome Lake	80	
Davidson	40	
Newray	20	
		6,140
Kirkland Lake District.		
Kirkland Lake	150	
Tough-Oakes	120	
Teck-Hughes	100	
Lake Shore	70	
Burnside	30	
		470
Boston Creek.		
Miller Independence	40	
		40
Larder Lake.		
Associated Goldfields	40	
Argonaut	30	
		70
Munro Tp. District.		
Croesus	50	
Hill Gold Mines	40	
		90
Grand Total		6,810

Concerning the ore reserves in the gold mines, it would perhaps be dangerous to deal with them all for the reason that at some of the smaller mines sufficient work has not been done to deal with them in safety. It is proper, however, to cite three leading mines, the official figures of which are entirely reliable, namely: the Hollinger with $41,000,000; Dome with $10,000,000 and McIntyre with $5,000,000. These three mines alone contain an aggregate of $56,000,000 in ore reserves. As the total of all the known gold mines of the district, unofficial estimates range from $75,000,000 to $100,000,000. From these figures, together with the foregoing facts, the known magnitude of the gold mining industry of Northern Ontario may be realized

Special Correspondence

BRITISH COLUMBIA.

The Collieries.

The present prospects are that the bituminous mines of British Columbia will not be affected by the strike in the United States. All the collieries of Vancouver Island, as well as those of the Provincial Mainland, are working as usual and there are no reports of impending trouble. The same applies, up to date, to the mines of the Province of Alberta.

It was reported some days ago that the State of Washington would look to British Columbia to replenish its empty coal bins, the assertion being made that 10,000 additional tons would be shipped to the Sound every month in order to assist in overcoming any shortage that might develop.

This caused some uneasiness in this Province, it being felt that it might result in industrial and domestic embarrassment at home. J. M. Savage, manager of the Canadian Collieries (D) Ltd., has stated that his company would make no greater shipments to the United States than usual for the simple reason that it was not in a position to do so. He said that the local demands were so heavy that the Company was fully occupied taking care of them. Certainly the local market would have to be cared for before export was considered. Much the same statement was made by W. A. Webb, of the Canadian Western Fuel Co., which operates the Nanaimo Collieries, who added that the State of Washington could not look for more coal than now was being sent out because it was outside the capacity of the company to make such deliveries. Consequently those who were inclined to dispute a policy of permitting export of coal at the present moment apparently have been silenced.

The bunkering of steamships sailing from Puget Sound ports will not be affected. Most of these vessels call at Nanaimo for their fuel. The Nippon Yusen Kaisha and Osaka Shosen Kaisha vessels will be able to obtain coal from sound bunkers which are filled from Vancouver Island mines.

H. A. Lovett, president of the North American Collieries, Ltd., in his evidence before the Alberta Government Coal Commission, advocated putting the coal mining industry of the Province of Alberta under the supervision and control of a board appointed by the Provincial Government, with power to fix wages, regulate working conditions, pass upon all proposed developments, widen markets, and generally look after the interests of both the producing and the consuming public. Free competition in the coal industry in Alberta, Mr. Lovett said, had proved an expensive luxury, a large amount of money having been wasted and lost. The lack of some public control had been seriously felt, among other ways, by the number of mines in operation. Twenty mines could produce the 6,000,000 tons of coal supplied to the Prairie Province trade at present by more than 300 mines. In some way, Mr. Lovett declared, the State must step in. The present experiment in railway nationalization would show, in due cource, whether the principle should be extended to the mines, but in the meantime the condition of the industry could be materially improved by a policy of public control and supervision.

THE METAL MINES.

Alice Arm.

A. J. T. Taylor, head of the Taylor Mining Company, Chris Spencer and Walter Leek, the latter two being heavily interested in the Company, have returned from a visit of inspection to the Company's property. They found that the season work on the Dolly Varden mine had been satisfactory and that there is every promise of shipments being maintained through the winter. It is expected that the October rate of output will be continued. At present a one thousand foot is being driven below the lowest existing working. This should tap ore bodies 250 ft. below the present tunnels.

The statement is made by officials that the Dolly Varden Mine shipped 112,000 ozs. of silver during September, and that the October total reached 150,000 ozs. The run of shipping ore is returning from 50 to 70 ozs., although some sacked toward the end of the season is expected to run 700 ozs.

The North Star Group, adjacent to the Dolly Varden, has arranged to ship some sacked ore this year. The Tiger Group and the Muskette, across the river, have developed some good showings and will continue with development work through the Winter, expecting to ship in the Spring.

The Dolly Varden officials state that the railroad between tidewater and their mine has experienced no operating trouble so far this year, and the weather alone will determine the length of its winter operations. Up to the time of their departure there had been no snow at the mine. They are of the opinion that the low reaching tunnel now being driven will open up large ore reserves, creating the necessity for extensions to the railroad and a new aerial tramway.

Salmon Arm, B. C.

R. K. Neill, of Spokane, Washington, has confirmed the recent report of the sale of a two-fifth interest in the Premier Mines to the Guggenheim Company and other New York capitalists. This is the largest mining deal made in British Columbia this year. While Mr. Neill declines to vouch for the accuracy of the statement that there are $5,000,000 involved in the transfer he asserts that the value of the ore blocked out is estimated as being between eight and ten million dollars.

Development of the Premier Mine will be continued, a force of sixty men being kept at work throughout the winter. The Company's intention is to erect its own concentration mills, making use of both the location and cyanide processes of gold recovery.

Discussing future plans, Mr. Neill said: "Of course you understand the mine is still a baby mine and like a baby must creep before it can walk. We cannot do all these things in a day but will progress as rapidly and as consistently as possible. We have had many difficulties to overcome. We have had to build a road sixteen miles to Hyder to bring our ore out. This was first constructed as a trail. Later it was widened to permit the traffic of a sleigh. Last year we widened it still more until it was a two-sleigh roadway, and this year it will be a fine highway. We brought 3,000 tons of ore out over the snow last year and must continue to haul out that way this winter. Eventually when our mills and concentrating plants are constructed we shall bring out gold bricks."

George Clothier, Provincial Government District Mining Engineer, after returning from a trip to the

Salmon Arm and Bear River Districts, speaks very glowingly of mining possibilities. He says that recently there have been no less than six properties on the Bear River bonded, interests having been secured in most cases by American capital. He refers to some rich prospects on the Nass River slope, which however could not be inspected because of the snow. Some ore brought from these went as high as 900 ozs. silver to the ton. That preparations have been made for the continuance of work through the winter on the Mineral Hills, Bush, Forty-Nine and Big Missouri properties is confirmed by Mr. Clothier. Supplies were packed to these claims before the road became impassable. He also refers to the fact that with the coming of snow the Premier Mine people will commence bringing out ore.

The Spider Group which has produced some rich silver ore from a narrow vein, is reported to have been sold to interests represented by W. A. Meloche of New York. The consideration has not been made public but it is understood that development work will be undertaken with no unnecessary loss of time.

Miners at Stewart have been interested lately in ore samples from the Motherlode group which was located during the summer by A. W. Balzimer and Patrick McBride. This property is situated about two miles above Big Missouri and comprises six claims. A shipment of fifty pounds of the ore is being shipped to Vancouver. The principal value is silver but it contains also some gold and considerable lead.

Nelson, B. C.

The Morning Star group is showing promise of development, a sample of gold-copper ore having been brought to Nelson to illustrate the character of a new strike made on that property. There are two ledges on the Morning Star group, and it is the smaller of the two which has been receiving special attention. It has been traced for two hundred feet and has been developed by an open cut. The ledge has a width of eight feet and the width of the ore is three and a half feet. Paralleling the small ledge is a large one, twenty feet in width, which shows some copper but has not yet produced such ore as the small one. The two ledges dip toward each other.

A movement has started having in view organization of the different mining communities of West and East Kootenay, British Columbia, for the purpose of directing their united influence and energies to the satisfactory solution of those problems affecting the industries in these sections of the Province.

Representatives of the Associated Boards of Trade have returned from a tour of this extensive district in the course of which a number of the leading mining properties were inspected, information obtained as to conditions in various localities, and public meetings held at which important matters were discussed.

The party went through the Standard Mine Concentrator at Silverton, the flotation process, which is responsible for the recovery of an exceptionally high percentage of the zinc content of the mine's ores, being in operation.

At Slocan City much was learned of local mining activity and at New Denver a general meeting took place, Colin J. Campbell, president of the Slocan District board of Trades, presiding, and W. Thomlinson, acting as secretary.

An outline of the work of the Associated Boards of Trade was given by F. A. Starkey, Commissioner, after which he referred to several projects in mind and on behalf of which he urged the support of all mining men interested in the districts's welfare. One of these was the arrangement, through the Government, for the opening up of idle properties deemed worthy of development by Government Engineers. Such properties could be worked under license by willing parties, if the owners refused to act. But Mr. Starkey's most important theme was the necessity for the establishment of an ore testing plant in the interior of British Columbia. He stated that the Dominion Government had appropriated $100,000 for this enterprise but had shown a disposition to place it at the Coast.

Discussing the need for overcoming this inclination Mr. Starkey said that the ores of the Interior were characteristically complex and its mines were developed, entitling it to a plant at which the problems of the many good undeveloped properties could be solved, properties that now were of no volue to the owners or the country because the owners, unlike the Consolidated Mining and Smelting Co., could not afford the expense of experimenting to ascertain the proper treatment. The ores of the Coast were relatively simple. The latter district had nothing like the development of the Interior and the authorities would not be justified in giving it consideration to the exclusion of the Interior.

That a policy of local syndicates for the development of prospects would be a paying proposition and a great benefit to the mining industry was the contention of the Chairman while C. F. Nelson, member of the Provincial Legislature, was emphatic in the declaration that the Kootenays were warranted in expecting the ore testing plant and that the Province was large enough for several.

The value of such an installation to the Kootenays was dealt with by Mr. Thomlinson who, as an illustration, pointed to the achievement of the Trail Smelter metallurgists who, as a result of experimentation, had made the Sullivan Mine, the ores of which originally gave much trouble, one of the greatest mines in the world. Clarence Cunningham now was treating zinc-silver ore. In the Boundary District flourite was being treated and shipped commercially. On the Arrow Lakes was an enormous ledge of complex minerals that might one day give a large payroll to the district. This depended on the solution of the problem of handling the ore. The Arlington Mine had been closed down because it could not use its second grade ore. Its old dumps were there to-day. There were old dumps and complex ores all through the Kootenay, and there were problems everywhere. Nor were the metals alone of value. There were other mineral deposits which, if their problems were solved, might become sources of great wealth to the country.

Taxation of minerals and the question of obtaining powder at cost for the prospectors and operators were other questions considered.

The following resolution was passed:

"That this meeting urges upon the Dominion Government the need of the erection of a plant in the interior of the Province for the purpose of aiding the miners of complex ores which occur to such a large extent in the Interior.

Therefore we, the representatives of the Associated Boards of Trade and of the mining industry generally, earnestly urge upon the Government the importance and real need of such a testing plant, which would greatly aid the smaller mine owners and the mining industry generally."

The Eureka Mine has finished its milling season. All the ore lately put through the Granite-Poorman Mill has been from No. 2 Level, on which a large body of good ore was tapped recently. Development on this as well as further work on the crosscut being driven to cut the vein on the No. 4 Level will be continued during the winter. In the meantime large samples of Eureka Ore have been sent to five testing laboratories for the purpose of obtaining advice as to the best method of treating it. With this information in hand the management will install the necessary plant to be operated in conjunction with the present stamp-mill which, as it stands, is adapted to the ore of the Granite-Poorman Mine.

Grand Forks, B.C.

Announcement of the cross-cutting of a dyke of high-class lead-bearing ore was made at the annual meeting of the Maple Leaf Mining Company held recently at Grand Forks. Samples, it was stated, ran from 31 to 36 per cent lead. The Company has tunneled 40 feet through the dyke by drifting on the contact, this tunnel now being 35 feet in the lead ore. The main tunnel has been driven for 178 feet and the drift started at about 100 feet from the portal, going through a red formation for a short distance before striking the dyke again. Directors were elected as follows: J. B. Miller, Walla Walla Wn., S. B. Sangers, Oroville Wn., Thomas Dunlop, Chesaw, and C. W. Brown, Molson, Wash., H. W. Collins, John Donaldson, and H. W. Young, Grand Forks. Mr. Young was elected president and managing director and Mr. Donald, secretary-treasurer.

Kamloops, B.C.

R. W. Thomson, Provincial Government Mining Engineer, has returned after making an inspection of the Snowstorm Group of Mineral Claims, Highland Valley, on which the government has been doing some diamond drilling. Surface stripping and other development now is in progress with a view to the resumption of the drilling in the spring. The properties are being surveyed in the meantime. Mr. Thomson also visited the property of the Aspen Grove Amalgamated Mines, Ltd., which now is under bond to James Errington and associates and on which considerable development is proposed.

Trail, B.C.

In order to keep its electrolytic zinc plant at Trail in operation during the inactivity of the Sullivan Mines at Kimberley, B. C., the latter being shut-down through a strike of the miners for an all round increase in wages of $1 a day, the Consolidated Mining & Smelting Company has arranged to treat the accumulated zinc concentrates of various Slocan district properties. The Rambler-Cariboo has 500 tons of concentrates the shipment of which has commenced. The Standard, at Silverton, also has begun shipment of zinc concentrates of which it is said to have some 300 tons. The Echo, at Silverton, is expected to contribute about 350 tons. A large quantity of zinc concentrates has been accumulated by the Rosebery-Surprise Mining Company but it has not accepted the smelting company's terms up to the present. The settlement price is 2 cents per pound for the zinc, 75 per cent of the zinc content being paid for when the concentrates run 50 per cent zinc and 1½ per cent being deducted for every unit the material is under 50 per cent. The settlement for silver is the New York price on the day of sampling, 50 per cent of the silver content being paid for, this rising to 60 per cent if the silver content is 30 ounces or over a ton.

Prince George, B.C.

What is said to be an important discovery of copper ore is reported from the Hansard Lake District, east of Prince George. From samples it is judged that the ore is the richest thus far found in that section of the Province and the vein is reported to be several feet in width.

Victoria, B.C.

The Lucky Jim, Lucky John, and Marjorie groups of mineral claims, situated in the Salmon River section, and near Adams River, Vancouver Island, have been acquired by T. H. Kerruish, who proposes undertaking development work without delay. The Lucky Jim is the only one of the three on which any work has been done so far and Mr. Kerruish considers the showings made sufficiently encourage to warrant further investigation. The ore carries copper, gold and silver values. Mr. Kerruish is asking Government assistance in the construction of a trail to the properties in order that equipment may be shipped in and ore easily transported to tidewater at the mouth of Salmon River.

Vancouver, B.C.

The matter of the dumping in Canada of Mexican lead was before the mining committee of the Vancouver Board of Trade recently when one of the members asserted that the lead producers of Canada and particularly of British Columbia are under a severe handicap in the marketing of their output because of the unfair competition caused by the importation of surplus Mexican lead. It was stated that Canada, apparently, was the only outlet for this surplus, which was being sold at any price it would bring. The committee decided to investigate and, if the allegations are found correct, to asking the Department of Trade and Commerce, Ottawa, to enforce the anti-dumping laws.

An increase of $1,017.75 is shown in the gold deposited at the Dominion Assay Office, Vancouver, B.C., for the month of October of this year in comparison with the total for the same month in 1918. The aggregate value of the deposits last month was $804,231.70, most of the gold coming from the Yukon and the Kootenay districts.

George Adams has left Vancouver for northern British Columbia in order to make preparations for the commencement of hydraulic operations on thirteen one-half mile leases situated on Tibet Creek, 107 miles northwest of Telegraph Creek. The property is reported to be exceptionally favorable for the work in mind, the water used having 400 feet head pressure and the supply being unlimited. The Tibet Creek Valley affords 300 feet of dumping grounds. Mr. Adams proposes operating four distinct hydraulic plants, each using two No. 6 Giants.

Riondel, B. C.

A syndicate has been formed to proceed with the development of the Kirby Group of Mineral Claims at Riondel. This property was located last Spring by A. J. Curle, of Kaslo, B. C., and was taken up by W. T. Kirby, of Winnipeg Manitoba, who is arranging for the work referred to. First class showings were brought to light last July, the interesting point being the establishment that the ore is quite different from the characteristic ore of the Blue Bell, which is nearby, being high in silver. An open cut has been made on the vein, cross cutting it, and 17 feet have been driven without showing up the footwall. In the milling ore is a five-inch width of galena which runs over 100 ozs. in silver and a high percentage of lead.

Port Arthur Notes

By J. J. O'CONNOR.

The Kingston School of Mining, Queen's University, has been requested by the Port Arthur Fort William Development Association to authorize the establishment of mining classes in Port Arthur. The matter is now under consideration and a decision will shortly be reached. It is probable that if the Queen's authorities are not able to grant this request, the University of Toronto will undertake to do so.

A convention numbering 81 delegates, representing every point between Port Arthur and Winnipeg, including Rainy River, met at Dryden on the 6th instant, to formulate a plan for the construction of a highway from Port Arthur to Winnipeg. The convention was a success from every point of view, and it is expected that work will be commenced in the spring of 1920. This road will give access to an extensive area of mining territory, and be of immense advantage in the prospecting and developing of mineral, agricultural and timber lands.

Mr. M. F. Fairlie, M.E., of the Mining Corporation, Cobalt, paid a visit to the Schreiber gold area, last week, for the purpose of investigating the new gold find at Victoria Lake 6 miles north of Schreiber, with particular attention to the Longworth, and Casselman-Smith claims.

MANITOBA MINES ARE PROMISING.

Mr. J. B. Tyrell Inspects the Gold Pan and Gabrielle Mines in Eastern Manitoba.

Mr. J. B. Tyrell, chairman of the Toronto branch of the Canadian Mining Institute and representative of the Anglo-French Exploration Company, Limited, has just returned to Toronto after spending some weeks looking over the properties of the Gold Pan Mining Company in the Rice Lake district in Eastern Manitoba. While there Mr. Tyrell also visited the Gabrielle property, which is the first claim staked in the district. To the "Canadian Mining Journal" Mr. Tyrrell made the following statement:

"Both properties look to be deserving of fuller exploration and development than they have yet received and the managers of the companies have asked me to direct such development as they seem to merit with the prospect of making mines of them. They have a shaft now which is about 250 feet deep. This is now being pumped out and on my next visit to the property, which will be as soon as the winter trails are ready for use, I hope to be able to make a full examination of this shaft. At the same time we are going ahead to do some development work and it will probably be necessary for us to instal a somewhat more efficient plant than is at present on the ground.

"The Gabrielle Mine will probably also be put into shape for development work this winter.

"I did not visit other portions of the district but prospectors were coming from many outlying claims with reports which are often backed up by specimens of ore from new discoveries of gold-bearing veins. Taken as a whole the district may be one that will yet give a good account of itself."

Both companies have their headquarters in Winnipeg and the directorates include many prominent business men of that city. The Gold Pan Company has been reorganized with Mr. J. H. Ashdown as president.

SODIUM SULPHATE DEPOSITS IN SASKATCHEWAN.

It is announced from Saskatoon that the sodium sulphate deposits at Lake White Shore will be commercially developed by the White Shore Chemical Company. The product, it is predicted, will revolutionize pulp making in Canada and the industry is expected to become one of the greatest of Western Canada.

—Boston News Bureau.

THUS SHALL MEN SAY—

Thus shall they say in years to come,
When men travel again foot-free.
"Here women died, here children sighed,
By death released."

So shall men speak in lanes of France
When the poplars have grown again:
"This church they razed, this altar blazed,
A devil's feast."

Thus shall sailors whisper at sea
Where the water lies cold and green:
"Here babes were sped, here rest the dead,
Weakest and least."

Thus shall men say 'mid rounded graves
Where the rusted guns keep guard:
"Lo, here lie they, who in their day,
Destroyed the Beast."

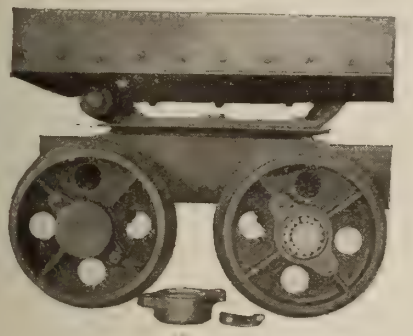
—F. W. Gray, in "Canadian Bookman."

ROLLER BEARING

MINE CARS

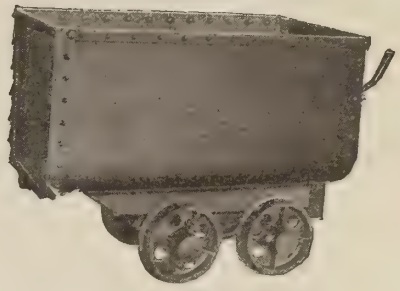
We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit.

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.



This view shows the oil or grease retaining cap removed to show the Roller Bearings supplied on our Mine Cars.

Same car as shown above, but in Dumping position.



END DUMP
MINE CARS

This is one of our many designs. Our catalog shows others—End Dump, Side Dump, and Rotary Dump. We make this car any size or capacity you want.

Send for your copy of our new Mining Catalogue.

BOLINDER'S Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only ½ cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only **$1:—per hour at full load.**

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

TORONTO BRIEFS.

Items of interest gleaned amongst the mining offices—What is going on in various northern properties.

From Our Staff Correspondent.

The head offices of Associated Gold Fields, this city, announced this week a valuable strike of high-grade ore on the properties of the company at Larder Lake. Being concerned with the blocking out of enormous tonnages of average-grade ore, the company does not stress its high-grade discoveries, but they claim that the latest find is of noteworthy width and richness. On the 500-foot level of Block B, in the west cross-cut of the south drift, a very rich patch is said to have been encountered. The company states that five feet assay $118 a ton, the next five feet $80 a ton and the adjoining 15 feet, not yet assayed, show gratifying amount of free gold. The patch is opened up 25 feet in the cross-cut.

It is reported in mining circles here that negotiations between the Timiskaming and the Buffalo Mines, whereby the former should take over the latter, appear to have failed to reach the desired conclusion. There is another report in circulation and that is that the Mining Corporation, as well as the Northern Customs Concentrator Company, are making a bid for the Buffalo properties. There are also rumors that the Mining Corporation is after the Thompson-Krist in Porcupine.

A. S. Fuller, a Cobalt mining broker, is completing arrangements for the reorganization of the Porcupine-Premier, formerly known as the Standard Mine, a property that conducted a very active development program some years ago with encouraging results.

Hollinger Consolidated created considerable interest in Toronto mining circles this week by making a record shipment of bullion valued at about $175 000. This was said to be the result of an eight days' run and it is understood that it is the company's intention to keep the future production around these figures.

J. P. Bickell, president of the McIntyre-Porcupine, is quoted as saying that the mine is expected to realize a net profit of a million dollars during the current fiscal year, one-third of which is already passed. This would compare with $839,000 during the past fiscal year. R. J. Ennis, manager of the McIntyre, declares that ore will average about $11 during the current fiscal year and that costs will average about $5 a ton, leaving $6 a ton net profit. The statement of the company appears to hold out the assurance that interim dividends of 5 per cent at intervals of about every four months can be paid as well as the accumulation of a larger surplus.

News from Porcupine is to the effect that the sampling of three veins being developed on the first level of the Clifton-Porcupine indicate that the work is being carried on in an excellent grade of ore. As a general rule it has been found that the gold content increases as drifting progresses north.

Digby Grimstone, a well-known prospector, has just returned to Porcupine from Painkiller Lake district, where he has been doing considerable development work. His properties are located between the Premier and the Hattie mines. On the Grimstone properties he reports a very promising vein about fifteen inches to three feet wide which has been traced from three to four hundred feet on the surface. There is apparently a great deal more development work going on in this section of Northern Ontario than is generally known. It is learned that the Premier mine has now got its shaft down 250 feet, at which depth cross-cutting is being carried out to cut the ore body which is indicated along the surface. The company is contemplating the erection of an up-to-date plant, as results of development work to date have been very satisfactory.

GOLD PRODUCTION DECREASED ONLY TWO PER CENT.

Interesting figures on mining activities culled from annual mining report of the Timiskaming & Northern Ontario Railway.

The annual mining report of the Timiskaming & Northern Ontario Railway, shortly to be issued, contains some interesting comment and statistics concerning mining activities. The report states that gold production for 1918 only decreased 2 per cent from the previous year and declares that "the necessity for keeping up, or even for increasing the production of gold is conceded by world statesmen and financiers, but how to do this in the face of increased costs is a problem for which the solution is still being sought."

The report shows that at the end of 1918 some 17 mines were equipped with mills for treating ore, with a capacity of 6,660 tons daily while only about 2,490 tons were then being treated. A summary of the position of Hollinger Consolidated Company is also given, in which it is shown that the consolidated companies up to the end of 1918 had produced $25,933,910 from which net profits of $13,379,074 were realized and dividends amounting to $9,424,000 paid. During the year 1918 some 22 mines of Cobalt shipped an aggregate of 17,911 tons of ore as compared with 20 companies shipping 19,016 tons in 1917.

During 1918 the Buffalo was the leading shipper, sending out 3,842 tons, followed by the Nipissing with 2,620 tons and the Mining Corporation with 2,264 tons. In 1917 the Nipissing was the leader with 3,539 tons followed by the Mining Corporation with 2,230 and the McKinley-Darragh with 2,123 tons. According to the figures in the report the mines of Cobalt up to the end of 1918 had sent out an aggregate of over a quarter of a million tons of ore; this in addition to the large tonnage treated locally.

Of the total of 266,734 tons shipped, the Nipissing was the leader with 39,650 tons, followed by the La Rose with 38,403 tons and the McKinley with 26,345 tons.

TRETHEWEY SHAREHOLDERS RATIFY DEAL.

At a special meeting of the shareholders of the Tretheway Silver-Cobalt Mines, Limited, held in the Standard Bank Building, Toronto, on Nov. 7th, a new stage in the history of the mines began, when the agreement for the purchase of the Castle stock of 1,000,000 shares and of 112 acres of water leases and the option of the Major claims of 40 acres, was ratified. All these are close together in the Gowganda district and while prospecting has not yet proceeded far, it is believed that there is sufficient silver to greatly extend the life of the Trethewey. Already the company has spent $150,000 in development work on the Castle property. The Trethewey had previously secured one-third of the Castle shares and now gets the remaining two-thirds in exchange for 500,000 shares of Treasury stock. Half a million shares was represented at the meeting by proxy.

EDITORIAL

"Who's Who in Canada and Why"

The Montreal "Journal of Commerce" has the following to say about the new edition of the Canadian "Who's Who:"

"The 1919-20 edition of "Who's Who and Why," edited by B. M. Greene and published by the International Press, Limited, Toronto, has made its appearance. It contains nearly 4,000 sketches, which is probably about the number of Canadians who are really entitled to inclusion in such a work of reference. For those who are concerned with industry, commerce and finance the list will be found fairly complete, though we note with some surprise the absence of Mark Workman, Sir Henry Pellat, Sir William Mackenzie, Hon. W. E. Edwards, F. Orr Lewis, W. I. Gear, F. H. Anson, Shirley Ogilvie, W. H. Moore, Dr. Milton Hersey, George Chahon, Jr., to mention only a few names which come to mind in connection with the world of directorships and business enterprise.

"But it is when we come to learning and the arts that we find the blank spaces most notable—blank, indeed, so far as the men who should be in a "Who's Who" are concerned, but filled up so far as type goes with the names of people whom few if any students of such a volume are ever likely to turn up. Out of 50 consecutive names in a portion of the book selected at random, 40 are company directors or managers with no other claim to fame, three are public officials, one is the principle of a ladies college, three are politicians, one is a publisher and editor, one is a judge and one (this is really astonishing) is a librarian. It is not possible, surely, that four-fifths of all the genuine attainment of Canadians is in purely business spheres and none of it in learning, literature or the arts."

We would add that judging from an inspection of the work there appear to be no men of note in the mining world of Canada. Of recent presidents of the Canadian Mining Institute we do not find included Mr. D. B. Dowling, or Mr. A. A. Cole. Practically no members of the Geological Survey are included. Dr. Ami, Theo. Denis and Dr. Miller are names we cannot find. The Fuel Controller, C. A. Magrath is not included, although the Assistant Fuel Controller, Mr. C. W. Peterson, is included. There is not to be found the name of a single superintending official of the Dominion Steel or Coal Companies. In Nova Scotia we miss the inclusion of such representative Canadians as Major the Rev. John Pringle, Moderator of the Presbyterian Assembly, and not unknown in Canada; the venerable Speaker of the Nova Scotia Legislative Assembly, the Hon. Mr. Goudge, and such persons as Prof. Sexton of Halifax, lately honored by Queen's University, the late George Gray of Stellarton, a most representative Nova Scotian, and the Hon. Robert Drummond. Even D. D. McKenzie, for a time leader of the Opposition at Ottawa, is not included.

The "Canadian Bookman" says: "Since the last publication of the late Mr. Morgan's admirable work, which is now many years old, we have no Canadian "Who's Who" except a volume to which admission can be procured by practically anybody upon payment of $25, $50 or $100, and from which practically all distinguished Canadians who do not care to part with such a sum are sternly excluded."

So far as regards men of eminence in the mining profession is concerned, "Who's Who in Canada" is not a complete source of information.

The Levant Disaster

The disaster at the Levant Mine, by which 31 men were killed, and 11 very seriously injured, is one of the worst in Cornish annals, and will excite sympathy from emigrant Cornishmen and their descendants who are represented in every rock-mining camp the world over. The accident was of an unusual nature, said to be the only case of fatal accident from failure of a man-engine of this primitive type that has occurred in England. In this issue will be found an interesting historical summary of the Levant engine taken from the "Mining Journal" of London.

There are several examples in Nova Scotia of Cornish pumping engines, of the rocking-beam type, not now in use, which were installed by the General Mining Association in the early days of the coal-mining industry there. Those who have had to deal with fallen pump-spears know the damage they can create in a wooden-timbered shaft, and in the Levant case the work of rescue must have been most difficult and very dangerous, but aid came from every neighboring mine.

GAS IGNITION BY SPARKING.

The "Colliery Guardian" is an old-established trade paper whose editorials are always worth reading, and in this issue we reproduce an editorial which is in effect a summation of what is known, or more correctly what is not known, regarding the ignition of mine gas and dust clouds.

The reference to the possibility of sparking originating from frictional electricity is interesting when considered in relation to the recent dust explosion at the Port Colbourne grain elevator. Canadian readers will also be interested in the parallel drawn between the behaviour of a certain roof strata in the Minnie Pit, where 155 men lost their lives by a dust explosion, and the occurrences reported by Mr. J. T. Stirling and Sir John Cadman after investigation of the circumstances attending the Bellevue Mine explosion in Alberta.

The incident reported by the Chief Inspector of Mines for India, in which a flash of lightning ignited an explosive mixture of gas and air, is reminiscent of a well-authenticated incident in the Pictou Coalfield in 1893 mentioned in Hon. Robert Drummond's book* on the mines of Nova Scotia. "During an electrical storm lightning ran down the shaft, the hoisting steelrope acting as a conductor. The lightning set the gas on fire, but did little other damage. The fire did not continue." The two occurrences seem fairly parallel.

While no very definite conclusions are expressed by the writer in the "Guardian", one thing grows increasingly plainer as successive colliery explosions occur, which is, that coal dust represents the greatest danger to life of any conditions existing underground. It is the chief predisposing cause of colliery explosions, and when these disastrous phenomena occur, it becomes the chief agent of their extension and propagation.

In the Minnie Pit explosion, as in the Port Colbourne disaster, and in thousands of other explosions that could be cited, there may have been frictional electricity, or unsuspected sparking from siliceous rocks, or other obscure and little understood phenomena, but, if the dust cloud had not been there, there would have been no explosion.

THE MINERAL WEALTH OF NEWFOUNDLAND.

Apropos of the contention in the "Journal" of October 1st that Newfoundland badly needs a government geologist, the "Mining Journal" of London gives prominence to an interview with Sir Edgar Bowring, High Commissioner of Newfoundland, upon his return to London, which it will be noted is in general agreement with these contentions. The "Mining Journal" correctly summarises the situation when it states that Newfoundland "does not yet know what she possesses in mineral wealth". A quotation from the interview seems timely and is given below.

"One of the most promising of Newfoundland's future prospects is connected with the wide and varied mineral wealth located from time to time, and it is strongly felt that the attention of enterprising mining pioneers, provided with adequate capital, would commence an era of great prosperity.

"The geological age of the Newfoundland rocks is largely pre-Cambrian, with Cambrian, Silurian, Devonian, and Carboniferous series, subsequently greatly planated by ice-action in post-Pliocene time. Whether the occurrence of fossil forms intermediate between those of America and those of early Palaeozoic Britain justifies the view that Newfoundland is a palaeontological stepping-stone between the two Provinces is a question for the specialist. What is certain is that the mineral wealth of the country is varied and great, and that it goes far beyond the copper, which, as our readers are aware, has been extensively worked since 1864, and the iron deposits which have been vigorously worked for many years by the great Canadian coal and iron companies. Chromite, nickel, antimony, lead, manganese, gold, and silver occur generally over extensive areas, and the coal deposits, which are expected one day to give a large output, have been sufficiently proved to warrant the most favourable expectations. The extent of the deposits at Codroy Valley and Bay St. George, to mention two of the coal-bearing areas, has not yet been accurately determined, but it has been proved that a huge Carboniferous syncline or trough underlies practically the whole of the Bay St. George district. The coal is of excellent quality, and one of the seams in the latter area is 4 ft 2 ins. in thickness. Oil shale also exists, and oil is produced, but it is noteworthy that the electricity produced by water-power is cheaper as a luminant than oil, and is used even in the smallest towns.

Notwithstanding that many reports have been made as to individual districts, Newfoundland does not yet know what she possesses in mineral wealth. A geological survey is now in progress, which will doubtless add materially to our knowledge."

If, as is stated, an adequate geological survey of Newfoundland is in progress, there can be little doubt but that the reward will be in exact proportion to the effort expended, and the announcement, if confirmed, is welcome and encouraging.

"If he play, being young and unskilled, for shekels of silver and gold,

Take his money, my son, praising Allah. The kid was ordained to be sold."—Certain Maxims of Hafiz.

"From the strictly national point of view, dependence on another nation for an indispensable raw material spells subservience, unless the dependent nation is prepared to face the consequence of a stoppage of the importation of this raw material.

"The dependence of Central Canada on United States coal is a cogent reason for the development of the coal mines of Nova Scotia to a point where, should for any reason the coal supply of central Canada be imperilled, the mines of our eastermost province could fill the breach."

—Extract from a memorandum prepared by the Editor, about 1916, for submission to Sir George E. Foster, Minister of Trade and Commerce.

* Minerals and Mining, Nova Scotia, pp. 343, q.v.

THE VANCOUVER MEETING OF THE CANADIAN INSTITUTE OF MINING AND METALLURGY, NOVEMBER, 26th. 1919.

Vancouver members of the Institute are working very hard in preparation for the shortly ensuing C. M. I. Meeting in Vancouver.

The Committees have been arranged, and are as follows:

Secretary Manager: Dr. E. T. Hodge, Professor University of British Columbia.

Banquet Speakers: Mr. Chas. Camsell, Director Western Branch Canadian Geological Survey.

Banquet Arrangements: Mr. S. W. Miller, Broker.

Resolutions:—Mr. J. M. Turnbull, Professor University of British Columbia.

Reception: Mr. W. M. Brewer, Resident Engineer.

General Entertainment: Mr. J. L. Parker.

Accommodation: John D. Kearns, President Rotary Club.

Luncheons and Mineral Exhibit: Kenneth Robinson, Boring Contractor.

Machinery Exhibit: S. J. Crocker, Mining Equipment.

Finance: Mr. Nichol Thompson, Manufacturers' Agent.

Automobiles: G. S. Eldrige, Chemist.

Ladies: Mrs. Keneth Robinson.

Smoker: Bradford W. Heyer, Editor B. C. Financial Times.

Stenographic: T. J. McIlveen.

Press: F. E. Payson, Pacific Coast Manager, Canadian Mining Journal.

The Mayor of Vancouver, on behalf of that City, is sending a personal invitation to every member of the Institute to attend the meeting.

Judging by the tone of the communications that are reaching the office of the "Journal," the West is calling this time in earnest, and if those who attend the Meeting are not given a thoroughly enjoyable time it will not be the fault of the Vancouver Committee, who are out to do just that.

Advance list of Papers.

The following is the list of papers expected to be read, subject to addition and changes:—

Wednesday, 26th November.

The Future of the Coal Industry in Alberta, O. E. Whiteside.

The Cassidy Colliery, Vancouver Island, E. G. Wilson.

The Future of the Coal Industry in the State of Washington, F. M. Freeman.

Thursday, 27th November.

Hydro-Metallurgy of Copper Sulphides, Wm. E. Green.

Treatment of Copper Ores, E. P. Mathewson.

New Methods of Hydro-Metallurgy in the Treatment of gold and silver, N. W. Freeman.

Taxation of Gold Mines, Frederick Bradshaw.

Geological Methods as applied at Butte, Montana.

Some interesting Geological Problems, D. C. Bards.

New Mineral Discoveries in the Stewart District, E. E. Campbell.

Friday, 28th November.

Platinum in British Columbia, R. W. Uglow.

Making up a Matte, H. N. Thompson.

Relations which should exist between the Government and the mining industry, R. W. Brock.

Union Among Technical Men, J. M. Turnbull.

Saturday, 29th November.

Trip to Nanaimo and Cassidy Mines.

Trip to Britannia mills and mines.

Trip to Clayburn.

Note: Owing to the indifferent rendering of the telegram transmitting the above particulars, the titles of papers and names of authors are probably not quite accurately given.

DOVER WELL NOW PRODUCING GAS AND OIL

The "shooting" of the deep well of the Petrol Gas and Oil Company in the West Dover district, Ontario recently was very spectacular. The bore is 3,382 feet deep, and 150 quarts of nitro-glycerine were used in the shooting operation. Oil was sprayed by the explosion over great distances. The well is now producing steadily 2½ millions cubic feet of gas and 200 barrels of oil per 24 hours. The Petrol Company was advised by Dr. N. Y. Williams of the Geological Survey, whose paper in the "Journal" of September 3rd will be recalled by our readers.

Dr. Williams in referring to the Trenton formation in which this well is situated characterises it as "perhaps the most alluring and at the same time the most illusive of the oil and gas bearing formations of Ontario."

To Dr. Williams' study of this field, and the application of his knowledge in directing the position of wells, much of the success which has been obtained is due.

Geological research always pays, and pays exactly in proportion to the effort and time expended thereon.

METAL QUOTATIONS.

Fair prices for ingot metals in Montreal, 19th November, 1919.

vember, 1919.

	Per lb.
Electro copper	24c
Casting copper	23½c
Lead	8c
Tin	57½c
Zinc	9¾
Antimony	10⅛c
Aluminum	32c
Steel Bars	$3.10
Plate	$3.35

PERSONALS.

Mr. J. J. Harpell and Mr. F. W. Gray, expect to attend the Vancouver meeting of the C. M. I. next week.

Mr. George E. Leighton, for many years the Canadian representative of the Hardy Patent Pick Company, who recently returned from a trip to England, has joined the Canadian branch of Samuel Osborn & Co., of Sheffield, England, as Vice-President. Mr. Leighton will continue to represent the Hardy Company in Canada.

Mr. R. J. MacLean of MacLean and Barker has returned to Montreal from England. Mr. MacLean has charge of the eection of a large turbo-compressor installation at the Springhill Mines of the Dominion Coal Company.

The Crude Oil Engine and its Adaptability to Mining Conditions

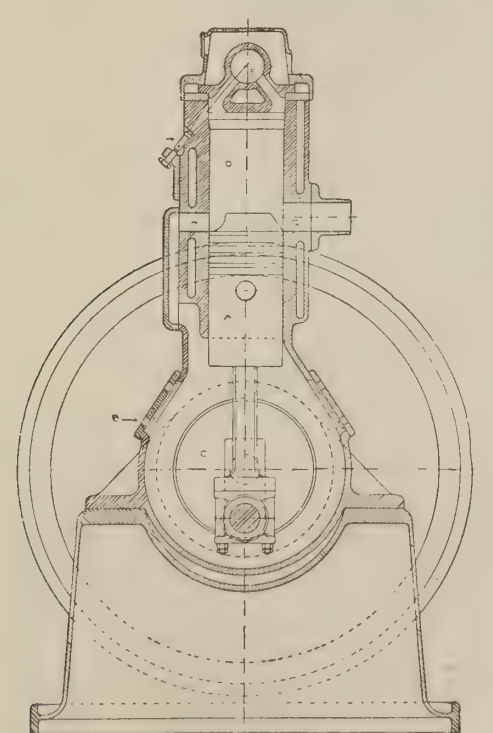
The crude oil engine has during the last ten or fifteen years been developed and perfected, and as a result it is today gaining a very extensive use, even where the highest degree of efficiency and reliability is required. For marine purposes it has become a very serious competitor to steam, and it is only a question of time when the oil-engined vessel shall have driven the steam-engined vessel off the seas. The full Diesel-type engine is at the present time installed as prime mover in many vessels of up to 14,000 and 15,000 tons, while the semi-Diesel engine, which is being built in units up to 500 and 600 b. h. p., is extensively used for smaller craft, full-powered motor-ships of up to 4,000 or 5,000 tons capacity, as well as auxiliary sailing vessels, barges, tug boats, etc.

During the War the semi-Diesel engine was used rather extensively by the British Admiralty. A number of motor-monitors were, for instance, equipped with Bolinder surface-ignition engines, and other classes of vessels were similarly equipped.

Also for stationary purposes, engines both of the Diesel and semi-Diesel type are now being used quite extensively, particularly for municipal lighting plants, and as power equipment for mines and other industrial establishments, where cheap water power is not available. The oil engine is no doubt the most economical power equipment that can be found.

The Diesel engine consumes about 0.45 lbs of oil per b. h. p. per hour, while the semi-Diesel engine consumes slightly more. With fuel oil worth today on the Canadian market about six cents per gallon, a semi-Diesel engine of, for instance, 100 b. h. p. will not cost in running expenses more than 50 cents per hour, or $5.00 for ten hours, and all other sizes of engines in proportion. This is, as will be seen, a very low cost as compared with a steam plant.

The oil engine also offers several other advantages. It does not require firemen. One man per shift is enough to operate even large units. It eliminates fire hazard, which is an enormous advantage, particularly in certain localities. It does away with hauling and shovelling coal. The fuel oil can be taken through a pipe line from the tank car on the railroad siding to the fuel tank at the power house, from which it is automatically pumped up to the fuel service tank in the engine room.



Section thru 320 H.P. Bolinder Engine.

For stationary purposes the semi-Diesel engine is generally adopted in preference to the full Diesel type. The latter is rather intricate, with a working pressure three times that of the semi-Diesel type.

The endeavor has been to simplify as much as possible the design of the semi-Diesel engine and to make it with as few working parts as possible, so that it might be operated with only the ordinary amount of care and attention required by a steam engine.

The accompanying sectional view of a 320 b. h. p. Bolinder engine illustrates the simplicity of design of this well known semi-Diesel type engine. The engine is of the two-cycle surface-ignition type and the working cycle is briefly as follows:

When the piston "A" at the end of its downward stroke is moving up towards the ignition chamber "E" the necessary air for scavenging and combustion is drawn through the air valves "B" into the enclosed crank case, and at the same time the air in the cylinder "D" is being compressed. When the piston "A" has reached its extreme upward position, a certain amount of oil is injected into the ignition chamber "E" through the nozzle "F," and the fuel charge ignites, resulting in the expansion of the gases driving the piston downward toward the shaft.

During this downward stroke of the piston, the air in the crank case is compressed. As the piston nears the end of its stroke the exhaust port "G" opens, and immediately afterwards the inlet air port "H." The burnt gases escape through the exhaust port "G," while the compressed air in the crank case, entering the cylinder by the air port "H," completes the scavenging work and furnishes the cylinder with air necessary to make up the next charge in the cylinder.

Low grade oil can be used as fuel, provided that it contains not less than about 18,000 b.t.u. per pound. Instances can be given where oil containing as high as 25 per cent asphalt has been used to advantage. A lighter oil is naturally to be preferred.

As to the durability of the oil engine, it has been established that engines of a good make will give satisfactory service during a great number of years with comparatively light repair bills. At an oil engine plant in a Canadian town it was surprising to learn recently that the engine had been in operation for over four years without the cylinder heads having been removed or the engine cleaned, and still the engine was running very well. Such a treatment of an engine should naturally not be encouraged, but it serves to show the dependability of this kind of equipment.

When using the oil engine in connection with electric generators it is advisable to have the generator directly connected with the engine, and by equipping the engine with a synchronizing device, two or more engines with generators attached can be run in parallel.

Some notable installations of this kind have been made during the last few years, and investigation of their applicability to mining conditions is to be recommended.

GAS IGNITION BY SPARKING.

The last report of the Chief Inspector of Mines in India contains an account of a remarkable explosion of fire-damp caused by a discharge of lightning in the new shaft at the Sitalpur coal mine, belonging to the Bengal Coal Company. The explosion occurred during a thunderstorm, and the evidence showed that a flash of lightning had, to all appearances, passed down the shaft causing disruptive discharges at certain points between the guides and the winding rope, rending the latter at two places situated respectively 228 ft. and 278 ft. from the surface. The distance between the winding rope and the side of the shaft was 5 ft. 4 in., indicating a spark gap of this width, and an intensity of discharge which could not fail to ignite the explosive mixture of gas and air known to be present in the shaft. There is apparently no limit to the vagaries of lightning, and the occurrence, rare as it is, presents no element of mystery.

It is, nevertheless, highly interesting as indicating possibilities; and one is naturally led to remember a considerable number of cases in which mysterious explosions have occurred in pits under conditions where human agencies seem to be excluded. In 1915, M. Ferey described in a paper read before the Société de l' Industrie Minérale phenomena of a similar character to the above. In a pit liable to sudden outburst of gas, for the sake of safety, shot-firing was carried out from the surface. During a storm, in the year 1905, shots went off in two places after the detonators had been connected to the conductors. These shots were situated respectively 1,490 and 1,410 metres from the firing station. Realizing the possible danger from this cause, the precaution was taken to cut the conductors at the bottom of the shaft and to connect them just before firing. Even under these conditions a shot went off spontaneously, owing, it is believed, to lightning. In explaining this phenomenon, M. Ferey says that it is necessary to remember that the electrical conductivity of the earth is not perfect, and that the capacity of a conductor is more effective if its extremity is earthed; while a comparatively feeble current is sufficient to explode a detonator.

We may, however, travel beyond the comparatively intelligible circumstances of lightning flashes during thunderstorms and consider certain more speculative views respecting the development of electrical conditions possessing elements of potential danger in coal mines. Let us begin with the electrification of dust.

In an illuminating paper, read by Mr. W. A. Douglas Rudge before the Royal Society of London, it was shown that the mere raising of a dust cloud produces a large amount of electricity, the sign of which depends upon the material used. Generally, acid particles become positively and basic particles negatively electrified. Again measurable charges of electricity are produced when particles of quartz, felspar, mica and other substances are rubbed against other particles of their own kind. Thus quartz rubbed upon quartz causes the particles to be positively electrified, and at the same time a negative charge is given to the air. Previously, in 1901, Hesehus had shown in Russia, that pieces of the same material when rubbed together become electrically charged with the same sign, while the dust abraded in the process receives a charge of an opposite sign. These charges are sufficiently persistent to be measurable with a suitable electroscope. Thus a puff of air containing 5×10^{-9} gr. of dust of mercuric sulphide gave a charge to a collector of several volts; while a centigramme of corn-flour, blown into a large room, charged the air to an extent which raised the charge on a collector to a potential of 200 volts, and the effect persisted for some time. The exact explanation of these phenomena is not clear, but the effect seems to be due to surface contact or friction. Neither is it at once apparent in what way these experiments can have any bearing upon pit explosions.

But interest in such phenomena is re-awakened by the evidence recently given in connection with the Minnie Pit enquiry at Halmer End just concluded. In the course of this investigation evidence was given as to the remarkable behaviour of the roof of the Bullhurst seam, known as Bulldog, which by rubbing under earth strain in the roof, and also by falling upon similar pieces on the floor, developed flares and flashes which seem to be different from ordinary friction sparks, and were referred to by Dr. Wheeler in his evidence at the enquiry, as frictional electricity sparks.

We do not propose to express any opinion just now upon the theory of sparking of the Bulldog as the possible cause of the Minnie pit explosion. It is interesting, however, in this connection, to recall the circumstances attending the Bellevue explosion, Alberta, occurring at intervals between 1910 and 1911, some of which took place when nobody was in the pit. These were investigated by Mr. J. T. Stirling and Sir John Cadman, and are believed to have been due to sparks produced by falling stones, a view which was supported by the fact that a large fall of rock marked the point of origin of one of the explosions. Experiments showed that the hard siliceous roof gave a brilliant display of sparks on falling, and when struck by a hammer the surface of percussion glowed red hot for an instant, owing probably to the ignition of bituminous matter in the stone. The sparks obtained by friction of one stone upon another could be made to ignite coal gas, a result which has not yet been obtained with the Bulldog of the Minnie pit. Negative laboratory experiments of this kind, however, are scarcely conclusive, because it is impossible to deal with such large masses of material as are concerned in falls of roof in the mine. The problem is also complicated by the possibility of electrical action, as suggested by Dr. Wheeler in his evidence at the Minnie pit enquiry, and there is clearly a case for further enquiry as to the possibility of firing methane by rock sparking on what we may term the grand scale. There is no reason to doubt the evidence brought forward by eye witnesses as to the remarkable character of the sparks seen in the Minnie pit. The length of flame alone seems to preclude the idea of more frictional sparks, and if they were in fact of an electrical nature, a temperature exceeding the ignition temperature of methane might easily be reached. We may, in fact, recall the circumstances of the explosion at the Maindy pit, Glamorganshire, on November 8, 1896, where a similar explanation seems to be sufficient to account for the occurrence.

It is unfortunate that in investigations of this character it is generally necessary to rely upon the method of exhaustion of other possible causes, a perfectly sound procedure when all the factors are known, but a dangerous practice where knowledge is incomplete.

—"Colliery Guardian."

THE DISASTER AT THE LEVANT MINE, CORNWALL, ENG.

Failure of Cornish-Beam Man-Engine.

A very serious disaster occurred at the Levant mine on Monday last, involving the loss of at least twenty lives, and probably considerably more, as well as of injury to others. This is the most serious accident which we can remember to have occurred in Cornwall, and the circumstances under which it took place are equally remarkable. The cause of the disaster was the breaking of the connection between the engine and the reciprocating rod or beam which works in the shaft, and constitutes the man engine. Reference was made to the Levant man engine in a recent article in this paper describing a visit to the Levant mine, and it is the only machine of the kind working in this country and, perhaps, in the world.

While the man engine is generally spoken of in these days as a survival of a peculiar primitive character, it is interesting to note that at the time of its adoption in Cornwall it was generally preferred by the men to the skip winding then employed in collieries and other mines, and at Levant to-day the ore is wound in ordinary skips while the men use the man engine. The man engine was first introduced in the Hartz at the Spiegelthal mine, working to a depth of 110 fathoms. This was in 1833, and in a short time numerous other mines became similarly equipped. The principle was advocated in Cornwall by Mr. Charles Fox in 1834, and the first installation was put in at Tresavean, and put to work in January, 1842. A year and a half later it had been extended down to the 200-fathom. In 1845 a similar engine was installed at the United Mines, working to a depth of 210 fathoms. Both these engines were worked with double beams, the miner in travelling stepping alternately from one to the other. In 1851 a new system was installed at Fowey Consols, consisting of a single oscillating rod, with sollars on either side. Three single-rod engines were erected in this decade: Fowey Consols, 280-fathom; Dolcoath, 220-fathom; and Levant, 200-fathom. The rods of the man engine were made of Norway pine, in average lengths of 36 ft., joined together like pump rods, the stroke of the engine in all cases giving a travel of 12 ft. In Hunt's "British Mining" it is explained that owing to the great improvements made in the pumping plant in the early years of the nineteenth century mines were deepened rapidly, and the exertion of reaching lower levels by ladders was more than the older men could endure, and consequently that some form of mechanical haulage became necessary. The question was taken up by Mr. Michael Loan, who suggested following the example of the collieries and winding the men by ropes. The miners, however, would not accept the idea of being "brought up like coal and rubbish," and objected that if the ropes broke they would be killed. In consequence of this the idea of winding was given up and that of the man engine rod adopted. One of our correspondents, writing to the "Mining Journal" in 1860, argued strongly in favor of the man engine as follows: "During the last few years a notion seems to have been growing in Cornwall that the mechanical raising of men from deep mines is to be finally accomplished not by man engines but by safety skips, or some other modification of the system now in use in coal mines. Now we all know the dangers attending this system even in collieries where the shafts are always perpendicular, and it consequently is an extremely doubtful question whether in incline shafts skips could ever be made sufficiently secure to be entrusted with human lives." He then proceeds to examine opinions expressed by the French Government expert, M. Moisennet, in a report on Cornish industry, in which he expressed the opinion that man engines were not only infinitely safer but much more economical, and likely eventually to supersede the winding system in use in collieries.

Curiously enough, although the Levant man engine has been working over sixty years, to say nothing of the plants in the other four mines, there does not appear to be any record of a similar accident in this country, or indeed of any accident at all involving more than the loss of one life; that is to say, due to individual carelessness of the men travelling, though there can be no doubt that to the novice using the machine for the first time an impression of great risk is conveyed. On the other hand, in Germany two similar accidents occurred in the eighties, in each of which eleven men lost their lives. Consequently, the immunity from serious accident which has characterized the man engine in this country appears to a large extent to have been a matter of good fortune and careful supervision of material rather than inherent in the system.

As to exactly what happened at Levant, as well as the magnitude of the disaster, full particulars are still wanting. It appears to be believed that the engine rod parted from the beam of the engine on the completion of the upward stroke, and that the whole beam then fell down the shaft, according to one account, to the bottom. The bottom of Levant is, we believe, about 330 fathoms deep, but how far the bottom of the beam is from the lowest point in the shaft we are not aware. The shock of the fall broke the beam in several places, and these sections falling in the shaft swept the sollars until they were wedged with debris and stopped. The most serious destruction was wrought in the upper part of the shaft, and no one was killed below the 140-fathom.

At the time of the accident the shifts were changing, and the beam was carrying a fairly full complement, so that the accident occurred at a moment when the effect was most serious. The mine possesses ladder-ways in the pumping shaft, and, of course, there is the skip shaft through which all the stone is wound but it is not suitable for hauling men in the ordinary way. The great difficulty which has to be encountered in rescue work is the difficulty of reaching men who may be jammed in the shaft, which necessarily takes a long time to clear, and there is reason to fear that the number of casualties may reach considerably higher than is at present known, and that many of the injured must have suffered greatly before they could be reached.—"Mining Journal."

ECONOMIC DEPENDENCE SPELLS POLITICAL SUBSERVIENCE.

Canada should be in a position to meet her own coal needs from her own coal mines. Canada's status as a nation will never be fixed until every effort has been made to make this country self-supporting. That our present condition of subservience to a foreign nation, however friendly at this time, reflects the Canadian spirit, cannot be asserted in the presence of our victors returned from the great war.—"Montreal Star."

Our Northern Ontario Letter

The achievements of some of the leading silver mines in the Cobalt field during recent weeks directly reflects the strong position of commercial bar silver. The value of the output in a number of instances is reaching new high levels. As an instance of this is the Nipissing, which, as pointed out last week in the Journal is producing at the rate of upwards of $500 every twenty-four hours.

The Mining Corporation of Canada has secured an option on the Buffalo, and is proceeding with an examination. At the time of writing, the consummation of a deal would appear to be probable. Lying adjacent to the Townsite property of the Mining Corporation, and containing a large quantity of low grade ore as well as possibilities of favorable developments, the Buffalo mine would appear to be a valuable acquisition to the Mining Corporation.*

In connection with the Buffalo Company, itself, a meeting is called for to-morrow (Nov. 20th) for the purpose of authorizing another reduction in capital The company was originally capitalized at $1,000,000 divided into 1,000,000 shares of the par value of $1. each. Two years ago the capital was reduced to $750,000 by paying shareholders 25 cents a share, and thus reducing the par value to 75 cents. Last year a similar reduction was made, thus leaving the company with $500,000 capitalization, made up of 1,000,000 shares of the par value of 50 cents each. To-morrow's meeting is for the purpose of authorizing payment of 35 cents a share, thus reducing the capital to $150,000 made up of 1,000,000 shares of the par value of 15 cents each.

The Lumsden Mine has been taken over by C. L. Campbell of Montreal, who announces that he is having the workings pumped out preparatory to making an examination. It is planned to thoroughly develop the property. Exploration work carried on several years ago resulted in one shipment of high grade ore being made. Sinking was carried to a depth of 400 feet with drifting and cross-cutting at four levels. This deal was referred to last week, the name of the "Drummond" being erroneously mentioned, and lacking the official details above given. Major Rattrey, formerly of the Borden Battery will have charge of operations.

The Penn-Canadian has evinced a desire to secure the Bailey-Cobalt mine on a fifty-fifty consolidation basis. The Penn-Canadian is equipped with a first class mining and milling plant as well as a fair amount of ore left in the mine, and with a tailings pile amounting to about 200,000 tons and estimated to contain around 750,000 ounces of silver. An attractive feature of the offer is the fact that the development of the Bailey-Cobalt could be proceeded with without any delay or expense in that the Bailey was orginally opened up under lease through the workings of the Penn-Canadian and is connected up on all levels, with the exception of the lowest level. Last week, the offer of the Northern Customs Concentrator Company through A. J. Young, came up before the Master in Ordinary in Osgoode Hall, Toronto, but objections were raised by the so-called minority interest with the result that the case was enlarged until today (Nov. 19th). It now develops that the minority interests claim to really control the Bailey. They appear to base this on the fact that the books of the company have been closed for over five years, and the present so-called majority interests are alleged to case their claim on the books as of five years ago.

The shareholders of the Trethewey having ratified the deal to acquire the Major property in the Gowganda district, as well as a lease of 112 acres under Miller Lake, the holdings of this company taken on added prospective value in which enters an added element of speculation. In view of the success met with on the adjoining Miller Lake-O'Brien Mine, the proposition is attractive.

Underground operations have been assumed at the Peterson Lake. The indications are, however, that no effort will be made at this season to treat the large pile of tailings from past operations and upon which appears to rest the best chances of commercial operations.

The Provincial is stated to have developed a considerable tonnage of low grade ore during recent months, although the importance of this has not yet been demonstrated.

At the Genesee property, a faulted zone has been encountered at a depth of 500 feet where lateral exploration is being carried on. Over a width of about seven feet assays show an average silver content of four ounces of silver to the ton. Although this is slightly below commercial grade, yet it indicates that operations are being carried on in the zone of enrichment and is pointed to as a promising development.

Philadelphia interests are still considering the advisability of opening the Silver Hill property, but, as yet, no definite announcement has been made. The property lies between the north-east part of the Nipissing and the Silver Bird property of the O'Brien.

During the month of October the Kerr Lake Mine produced 112,000 ounces of silver, the output being the highest for several months. This is at a rate of close to the average monthly output during the fiscal year ended August 31st when a total of 1,482,649.40 ounces was produced.

During the month the price of silver averaged close to $1.20 an ounce lending an estimated value of about $134,000 to the October production. This is at the rate of about $1,612,800 a year, as compared with gross profits of $1,637,143.71 during the past fiscal year, of which $956,258.19 was net profit.

The Kerr Lake has put into practice the proposed system of workmen's committees, the personnel of which is men employed by the company. The new plan promises to give the utmost satisfaction.

It will be recalled that during the labor strike of last summer the mining companies refused to recognize the Western Federation of Miners, but made a proposal to the men that if they returned to work the companies would agree to the men forming workmen's committees at individual mines and in this way discuss with the management matters concerning the welfare

*Note: A later announcement by the officials of the Mining Corporation of Canada states that it has bought control of the Buffalo Mines Limited. No further particulars of the transaction were given, except that the reported purchase price of $300,000 was incorrectly stated.

of the employees. Later on, after such individual committees are formed throughout the camp, they will probably select from among the number one central committee which will be recognized by the Mine Managers' Association as representative of the employes as a whole. In this way, union and non-union men alike share in a full measure of recognition as employees at the mines.

According to the annual statement just issued by the Hudson Bay Mines, the mine produced just a little over $3,000 net profit during the fiscal year, the poor showing being attributed to the high cost of labor and material, and a natural decline in ore. Ore reserves are estimated to contain upwards of 100,000 ounces of silver, and, despite the unfavorable year just past, the management is optimistic over the outlook and predicts the new fiscal year will be a prosperous one.

In Cobalt there is a general tendency to regard the present quotations for silver as not likely to be marked by any very material recession. This factor, taken in conjunction with the indication that high costs have passed the crest, leaves the producing mines in a strong position. Average costs at the various leading producers amounts to about 55 cents an ounce, thus leaving a margin of about 70 cents an ounce as net profit. Compared with this, a few days ago, costs averaged arount 25 cents an ounce and silver sold at an average of about 55 cents an ounce. Net profit of today, therefore amounts to more than twice as much per ounce of silver produced as was the case a few years ago. Offsetting this, of course, is the natural decline in production which has served to place the Camp as a whole on a profit earning basis about on a par with its banner days, when, although silver was cheap, yet gross production was at the peak, or more than double the present output.

Regarding the proposed plan, as outlined in last week's Journal, to construct light narrow gage railways to outlying mining camps such as Gowganda, nothing further of an official nature has been learned.

Silver Output for week exceeds half million dollars.

During the week ended November 14th, five Cobalt companies shipped a total of seven cars containing approximately 531,856 pounds of ore. The Buffalo was the heaviest shipper with two cars containing 198,000 pounds.

Following is a summary:—

Ore Shipments.

Shipper.	Cars.	Pounds.
Buffalo	2	198,000
Trethewey	2	125,969
La Rose	1	83,475
Mining Corp.	1	64,414
Coniagas	1	60,000
Total	7	531,858

Bullion Shipments.

During the corresponding period the Nipissing and the Mining Corporation made heavy shipments of bullion, the total amounting to 344,671 23 fine ounces. With silver having been quoted at between $1.25 and $1.28 an ounce during the week, it is evident that the weeks' shipments had a value of well over $400,000.

Following is a summary, in which it will be noted that the 60-bar shipment of the Nipissing was reported last Saturday:—

Shipper.	Bars.	Ounces.
Nipissing	60	80,811.51
Nipissing	148	200,517.48
Mining Corp.	64	63,342.24
Total	272	344,671.23

The value of the bullion, together with the estimated value of the ore shipped, brings the total value of the weeks shipments up to well over half a million dollars.

The Gold Mines.

Regardless of problems which still tend to worry the captains of industry, the gold mining industry of Northern Ontario continues to grow. Confidence in the future stability of prices, and a gradual decline in costs, and assured of longevity of the leading mines, freer rein to desired enlargment of operations appears to be one of the certainties of the future, not far distant.

The find at a depth of 1500 feet on the McIntyre-Porcupine is a confirmation of what had been learned by core-drilling. To all the leading mines it holds out added potentialities—assurance in fact. This company is now planning to continue the central shaft to a depth of 2000 feet. Continued development of ore to such a depth would unquestionably be followed by additions to the milling equipment. As the mine now stands, the physical condition and the milling facilities are adequate to make a net return of 20 per cent annually to shareholders. It is generally believed that the McIntyre will ask for a further extension of time on the option on the Plenaurum property.

The reported offer of $10 a share for control of the Hollinger Consolidated is stated to have never been made, according to an official of the company, who is quoted as having said: "Even were such an offer made, it would not be accepted." In connection with dividends on the Hollinger, it would not come as a surprise were the present policy to continue for some few months longer, no increase being made with the possible exception of two dividends in December, one in the form of a Christmas bonus. The Hollinger has indicated commercial ore to a depth of 1800 feet by diamond drilling, and in due time underground work will be carried to that point and beyond. Up to the present the great volume of ore has been taken from levels down as far as 800 feet. Below that point, work has been chiefly of an exploratory nature.

At the Dome Mines, according to official advice, an average of about 30,000 tons a month is being treated. No official statement has been made regarding costs, but it is learned in usually reliable circles that average costs are now a little under $4 a ton, being the lowest at any gold mine in the Dominion. Provided president J. S. Bache carries out his promise made some months ago, a dividend may be expected at the turn of the year, an announcement concerning which might be expected within the next month. As to the Dome Extension, a substantial tonnage will be treated in the Dome mill during the winter, the result of which will probably determine the course of the Dome in relation to the option it holds on Dome Extension and which holds good only until March.

Frank Hamilton, manager of the West Dome mine has made an examination of the Moneta property with a view to carrying on exploration work at or near the point where some "float" gold-bearing ore

was discovered by men who were digging a well. The Moneta, as well as the West Dome, is under the Pellatt Directorate.

Optimistic reports are in circulation in connection with the future plans of the Porcupine V. N. T., although official advice is decidedly difficult to obtain. In the Kirkland Lake district, a number of new operations are under way, in addition to the proven mines. Among the new ventures might be mentioned the Granby-Kirkland, Greene-Kirkland, Kirkland Combine, Marigold, etc. The latter is now in control of the property formerly known as the Lucky Cross. A number of short ore shoots have been found on the property, as indicated in a recent report.

The Wright-Hargreaves is not likely to acquire the control of the Sylvanite property, according to late official advice, despite many earlier rumors, that the Sylvanite would be absorbed by the former company. It is stated, that while differences appear to have cropped up in connection with the Tough-Oakes and the marging properties, yet the belief is still entertained that the Sylvanite may be ultimately included in the new consolidation.

The old mill on the Argonaut property (formerly the La Mine D'Or Huronia) in the Beaverhouse Lake section of the Larder Lake district is now in operation. It consists of stamps and straight amalgamation. It is being planned to add a ball-mill to the grinding equipment. In the meantime, the shaft has been continued from 80 feet to a depth of 200 feet at which point it is proposed to carry out lateral work. The ore contains considerable iron sulphides and is found difficult to treat with the present mill, the percentage of recovery not being as satisfactory as might be expected.

Another Ore Statement.

Following is a statement of ore shipments over the T. & N. O. Railway, for the month ending October 31st. (In tons of 2,000 lbs.)

SILVER ORE.

Cobalt Proper.	Tons.
Buffalo	573.45
Beaver	34.78
Coniagas	97.77
Dominion Reduction	32.50
Hudson Bay	30.69
La Rose	79.62
McKinley-Darragh	190.11
Mining Corporation	108.59
Nipissing	892.13
O'Brien	64.00
Penn Canadian	30.00
Peterson Lake	47.93
Thethewey	32.59
	2,214.16

The above shipments were made to the following Companies:—

CANADA.		
Deloro Smelting & Refining Co.	Marmora	650.47
Coniagas Reduction Co.	Thorold	97.77
UNITED STATES.		
American Smelting & Refining Co.	Pueblo	189.74
American Smelting & Refining Co.	Chrone	44.00
Pennsylvania Smelting Co.	Carnegie	220.11
ENGLAND.		
Henry Wiggin & Son	Birmingham	1,012.07
		2,214.16

NOTE.

Oct. 10th. Lowest price of silver during month	117,000
Oct. 30th. Highest price of silver during month	123,375
Average price of silver during month	119.192

THE SONS OF MARY.

The Sons of Martha have not to worry—of that their tetrarchs will take good care:
And they care not a whit for the Sons of Mary, what they must suffer or how they fare.
The Sons of Martha demand an increase (a favorite indoor game that they play):
They spout and they riot until they win it—and Mary's Sons are the lads that pay.

The Sons of Mary in all the ages have dared the venture and taken the chance;
They explore earth's riches and plan the bridges; invent the machinery, design the plants.
It is through them that on every work-day the Sons of Martha have work to do,
It is through them that on every pay-day the Sons of Martha get every sou.

They say to the railways, "Be ye fashioned." They say to the ships of the air, "Go, fly."
They train the youth and they heal the stricken; the tears of the mourner they help to dry.
They draft the maps and they paint the pictures; they carve the statue; the speech they speak—
While the Sons of Martha are seeking solely to do less labor for more per week.

The Sons of Mary their lives have given to fight the fever and purge the filth;
They graft the scion, they grow the blossom, they keep the fields of the world in tilth.
They write the book and they chant the poem, they make the music and dream the dream:
They to the Truth bear unselfish witness; they have the vision, they see the Gleam.

They do not preach that their only duties are spreading dissension and going on strike;
They do not teach that it's square and decent to scamp their work as they damn well like.
They aim to uphold a mind of fairness, not class suspicion and social strife.
They, too, must think of making a living—but they sometimes think of making a life.

And the Sons of Martha esteem this silly, convinced that Fortune will yield reward
To him that has the most brazen thorax, the lightest head and the strongest sword.
This, it seems, is the sum of their Credo—this is the way their reasoning runs:
"Let's force the birthright and seize the blessing, and lay the burden on Mary's Sons!"

—G.S.S. in New York Tribune.

Special Correspondence

BRITISH COLUMBIA.

Both the Britannia Mining & Smelting Co. and the Granby Consolidated Mining & Smelting Co. have subscribed half a million dollars to the second Victory Loan now being raised in Canada.

Alice Arm, B.C.

The Mineral Claims Development Company, Ltd., of Vancouver, is developing the Homestake Group, Alice Arm. The object of this company is to take up and develop prospects to the point where they can be offered to operating companies as proved mines. The Homestake Group consists of four claims of which George Clothier, Government mining engineer, says:

"Taking into consideration the width and continuity of the vein, the persistence of the mineral content, the improvement in appearance on what little depth has been gained in the open cuts, the grade of ore exposed in some of the cuts, and its favorable situation for mining, there are good reasons to believe that the property might easily develop an immense tonnage of concentrating ore."

Col. Gilson is the president of the Mineral Claims Development Company and C. M. Houghton is vice-president. The latter has been identified with the mining industry in British Columbia for the past twenty years, having been one of the pioneers of Rossland, B.C.

Stewart, B.C.

This mining centre may be said to be 'all set' for the winter. While many of its inhabitants have come south to spend the more severe months of the season there will be some 150 people remain in the town until the spring. A school has been opened and a good class of children has been mustered. In short, Stewart, not much more than a year ago deserted and without prospect of rehabilitation, is assuming the aspects of a permanent community and its residents have the utmost faith in its future.

Chief among the causes of its sudden development is the discovery of the riches of the Premier Mine, on which work is to be continued during the winter and from which several shipments of exceedingly high grade ore are expected before the spring. The Big Missouri, Joker, Forty-Nine and Bush also are promising groups of mineral claims, which are confidently expected to prove the mineral worth of the district of which Stewart is the Canadian outlet. While they are not yet proved mines, development in some instances is well advanced, and trial shipments probably will be shipped to the smelters this winter. In addition there are many prospects, the surface showings of which are most encouraging, the result being that prospectors and operators predict that Stewart is to be a mining town of first importance in the Canadian Northwest and that this will become more generally recognized during 1920.

On the Big Missouri the drilling has ceased, to be resumed on the return of better weather conditions. Work is to proceed without interruption in the driving of a cross tunnel on the E. Pluribus Claim, on which a high grade body of ore is being developed. The Province Group, it is expected, will be developed by diamond drill next season. Drilling on the Forty-Nine also is finished for the year but a considerable force of men will be maintained during the winter months. The Bush Mines, situated to the north of the Premier, are being extensively developed with encouraging results, ore of the first grade having been struck. On the New Alaska a tunnel is being driven to open up the ore body. The Nabob Group, on Glacier Creek, has been bonded by C. G. Shoning and associates of Lead Point, Wn. An assay of samples from this property secured by Mr. Skoning before the closing of the deal is said to have given returns of $189 in silver to the ton at current prices. Mr. Skoning, who has come south, proposes returning in the spring with the machinery necessary to open up this group.

A number of old properties are expected to become active next year. One of these is the Indian, on which some work was done in 1910, some first-class galena being taken from it at that time. There also is the Hercules for which a deal is said to be pending.

Anyox, B.C.

The Hidden Creek Mine, of the Granby Consolidated Mining and Smelting Company has increased its ore reserves as a result of the past year's development. The quartz property operated to supply silica to the smelter is carrying larger gold values than formerly.

The company's by-product coking plant at Anyox is undergoing repair. Fourteen ovens, however, are again in operation.

Sandon, B.C.

The most active mining camp of the Kootenay is Sandon, which is regaining its past reputation of being the premier silver-lead centre of the Province. It is estimated that there are four hundred men working in the mine and mills of the Sandon camp, including the Alamo concentrator. Five mines are producing ore for Clarence Cunningham, the largest individual operator of the district. Of these the ores of the Idaho, the Sovereign, the Wonderful and the Old Richmond-Eureka, are treated at the Alamo concentrator. Queen Bess, which made a fortune for Mr. Cunningham, is shipping its high-grade silver ore south of the line for treatment. The Rosebery-Surprise Mining Company, Limited, is operating three properties in this camp, the Surprise and the Ivanhoe, which are shipping to the company's concentrator at Rosebery, and the Canadian, which is under development. This is in addition to the Bosun of New Denver, which employs forty men and sends ore to Rosebery. One of the oldest and biggest mines of the country, the Noble Five, is terminating a five-year period of deep development by erecting a big concentrator only less than that of Alamo in size, in which the machinery now is being installed. This is expected to be working early in the year if not before. Mill feed for two years is in sight. Honorable James Dunsmuir, owner of the Noble Five, acquired the Reco, an adjoining property, during the summer, and it is being developed on its own line, but eventually will be joined in deep development with the larger mines. The Silversmith is now in what is probably the largest ore shoot at present exposed in the district. The high grade ore having a width of four feet. This great ore body is between the eighth and tenth levels. The Rambler-Cariboo, to which has been joined the Jenny and Last Chance claims, also has struck a new body of milling ore, and ore is being milled from the 1,000, 1,200 and 1,300-foot levels. The McAllister at Three Forks is another mine of much promise. It is operated by the Spokane Silver Mines Limited and since its re-opening last August development has been in progress without cessation. There are now blocked out five thousand tons of ore. Be-

sides there are many smaller mines and a large number of prospects upon which work is being done. In brief, the present condition of the Sandon camp is better than it has been for years. Zinc, which was formerly useless, and in fact it was considered a handicap to ore, is now in the form of concentrates, a more or less important product at every concentrator. It is unnecessary to speak of the high market value which is the chief contents of the ore of the district. For these reasons mining men are looking forward to a period of remarkable prosperity.

A new strike of clean galena is reported in No. 1 tunnel of the Granville property, Sandon. The Granville group is twenty years old and the tunnel in which this ore body was disclosed is one of the two old drifts which penetrate the mountain from opposite sides giving it about a hundred feet of extreme depth. On the main working level, which consists of a long cross-cut to the vein, a crew of men has drifted forty feet on a three-foot width of mill feed which carries on the foot wall three inches of galena carrying high values in silver and lead. There are three veins on the property and some eight hundred feet of work has been done.

Nelson, B.C.

Some excellent samples of ore have been taken from the Grant group, which is situated on Woodberry Creek. This property is in a dry ore belt and assays from similar specimens to those produced have run 1,545 ounces of silver, very light in lead and no zinc. The property is being developed by a drift that has been carried 150 feet. A shipment of thirty sacks to Trail Smelter last year brought $800.

It is the intention of the present owners to resume the development of the Athabasca Mine at Nelson. The mill will be put in operation. The Athabasca has been a large producer of gold during the past 20 years.

C. M. Moir, manager of the Spokane Mining Development Corporation, states that the Monarch Mine will be placed on a producing basis with as little loss of time as possible. Developed by open cuts, tunnels and shafts, two distinct ore bodies have been proven on the Monarch on different vein systems. The ore body developed last year produced three cars of ore from a 20-foot glory hole, the ore, which is self-fluxing, running 3½ per cent copper, and returning $15 to $18 a ton. There also is some value in precious metals. It is now intended to operate the property on the scale the known ore bodies warrant, and a compressor, air drills, serial tram, and electric power will be provided. Major MacDonald will be in charge. The carrying out of this programme of development should make the Monarch one of the most important properties from the standpoint of production in the district.

Quesnel, B.C.

R. W. Marsh has returned from Minneapolis, where he has been successful in financing a company organized to manufacture and operate his patent for the recovery of the gold and platinum values from the black sand. One of the leading dredging companies has investigated the patent and vouches for its practicability. Quesnel has been selected as the site for the first plant. Black sand will be purchased for treatment on the same basis as a smelter buys ore. The Process is an electro-chemical one and Mr. Marsh, the inventor, is one of the pioneers of the Cariboo.

John S. Horgan of the Lightning Creek Gold Gravel and Drainage Company will have charge of that company's mining operations henceforth. It is proposed to sink a gravel shaft to the bed rock in the original channel near the centre of the company's property.

Britannia, B.C.

The Britannia Mining & Smelting Company has been short of water for power owing to the dry season, the heavy frost preceding the snow fall preventing the replenishing of the supply by the the thawing of the underlying snow. Consequently the turbo-generating plant has had to be put in commission to supply power. In this plant steam is generated by oil fuel.

Victoria, B.C.

The recovery of potash from cement plants is the subject of a booklet compiled by Dr. A. W. G. Wilson and issued by the Canadian Department of Mines. It is stated that the potash content of the raw mix at the Tod Inlet Cement Works, Vancouver Island, is 0.50 per cent and at the Bamberton plant, also Vancouver Island, 0.53 per cent, while the cement carries 0.44 and 0.47 per cent respectively. The loss of potash at Tod Inlet through the lack of a potash recovery plant is over two tons a day, and at Bamberton, when operating, over one ton a day. Dr. Wilson points out that fifteen plants in the United States have installed potash recovery equipment.

Hon. John Hart, Minister of Finance, has announced that none of the British Columbia lands of the late Augustus Heinze, which were offered at tax sales held in 1918, have been redeemed. Consequently these holdings have reverted to the Crown. The property is situate chiefly in the Nelson, Rossland, Slocan and Kettle River assessment districts and totals approximately 701,543 acres. At last year's tax sale the sum of $55,000 was due in taxes. While some of this property was considered of value because of its mineral producing possibilities there was a quantity with much merchantable timber and a good proportion of agricultural land. Sections of the reverted lands form part of the grants made to the British-Southern and Columbia & Western Railways. Heinze acquired a half interest in these several years ago and since then no taxes have been paid.

The Ladysmith Smelting Corporation has taken a bond on a property situated on Thurlow Island belonging to the Green Lake Mining & Milling Company. The latter has been engaged in development during the summer.

Fort Steele, B.C.

The Victor Mine, Mouse Creek, is expected to be producing in the course of a few weeks. G. Gundry, who holds a lease, has obtained the necessary financial support and is purchasing the machinery required for a 50-ton concentrator, which it is hoped to have in operation before the winter is far advanced. The mine is a high grade silver proposition and there is said to be a considerable supply of rich mill feed available. It is planned to add to the capacity of the concentrator in the spring.

The Wild Horse Dredging Company, Wild Horse Creek, has suspended operations for the winter, the cold weather making it impossible to run the dredger to advantage. The company proposes operating vigorously next summer. This year delays were experienced in getting in machinery so that the actual season was short. These handicaps will not have to be faced next year.

Grand Forks, B.C.

J. E. Leonard, manager of the Chatterby Mining Company, which is operating the Lucille Dreyfus Mine, situated near the Great Northern Railway, two miles from Danville, Wn., has made the following interesting statement respecting the development of that property: "The ore body which has been yielding in the upper workings is to be sought by a cross cut, to be driven at an additional depth of 500 feet. The total depth to be attained will be 800 feet. We expect to complete the work in from 60 to 90 days. Operations will proceed with two shifts and with machine drills. A shipment of ore is to be made to the Trail Smelter immediately. The additional depth will be attained by use of a tunnel on the property of the Minnehaha Mining Company, on which the Lucille Dreyfus Company has a lease. This company also has obtained a lease on the compressor plant of the Minnehaha Company. Shipping ore in a body three to four feet wide is being followed by drift on the No. 3 tunnel level. This property has yielded considerable ore in the last three years." The company's officers are J. J. O'Connor, superintendent; A. D. Monnett, president, and Judge Chester F. Meller, secretary-treasurer. The head office is at Dayton, Wn.

Slocan, B.C.

A new discovery of dry silver ore is reported in the Bear River section by a party of prospectors returned from the hills for the winter and who propose to return as soon as the snow leaves to commence development. The property consists of three claims staked on Blue Mountain, which mark the location of a ledge, varying in width from one to three feet, and which has been traced for a distance of 600 feet. The samples show silver sulphide, native silver, and some gold. Assays run from 123 to 167 ounces of silver.

Trail, B.C.

Anticipating a program of development on an extensive scale the Consolidated Mining & Smelting Company is letting contracts for 765 feet of rails to be used on the new main level of the Sullivan Mine. Contracts also are to be awarded for 1,000 feet of tunnel and 500 feet of crosscutting. It is understood that the company, largely as a result of the present strike of the miners employed at the Sullivan Mine and the failure to date to reach an adjustment of the trouble, has decided to resort to the contract system of mining ore.

Ore receipts in gross tons for the week from October 22nd to 31st inclusive at the Trail smelter of the Consolidated Mining & Smelting Company totalled 4,897, the aggregate for the year to the date indicated being 275,597 tons. The largest contributors among the independent shippers were the Iron Mask, Kamloops, 845 tons; the Mandy, Le Pas, Manitoba, 406 tons; the North Star, Kimberley, 306 tons; the Quilp, Wn., 245 tons; the Standard, Silverton, 355 tons; and the Echo, Silverton, 104 tons. Of the company's properties the largest shipper was the Centre Star, Rossland, 1,422 tons. No lead or zinc ore was shipped from the Sullivan Mine, Kimberley, owing to the strike.

Kamloops, B.C.

The development of the Aspen Grove Mineral Claims, numbering 75 in all, is likely to be proceeded with before long. Joseph Errington, mining engineer, and a number of Eastern financiers, have taken a bond on this property. They propose doing considerable diamond drilling which would have been started before now but for the fact that Mr. Errington was detained in looking after interests at Brule Lake and at Cobalt.

Atlin, B.C.

There is a prospect that the immense deposits of hydro-magnesite in the Atlin district, British Columbia, will be developed. To place this property on a producing basis has been a problem before Nichol Thompson, of Vancouver, B.C., who with others is interested, for some years. Through correspondence he has interested British clients. Two difficulties have to be overcome. The first is that of transportation, the cost of which, because of the fact that the deposits are situated in the far northern interior, is somewhat high. The second is that of devising an effective as well as an economic method of calcining. Mr. Thompson recently was in receipt of advices from England that a process of successfully calcining fine powdered magnesite has been worked out so that at least one of the stated handicaps appears to have been overcome.

Dawson, Y.T.

About 120 new claims have been staked on Keno Hill and the extension of the new Mayo Silver district, and some 20 on Steep Creek, adjoining Lookout Mountain, since the middle of the summer. The Yukon Gold Company has an option on a group situated on Keno Hill where prospecting is in progress. The company also has staked water rights at Fraser Falls. Lookout Mountain, it is expected, will ship 500 tons or more silver and lead next spring. Moosehide, a well known creek north of Dawson, has been staked by John Lawrence and Chiefs Isaac and Silas, and 20 other Indians.

There seems to be a general tendency in the western provinces of Canada to adopt revolving tipples and shaking screens for the handling and screening of coal at collieries. This is in line with Cape Breton practice. There is no department of a colliery where so much unnecessary labor is possible as on the bankhead, and no department where careful layout of the bankhead tracks and screens for automatic handling, will effect so permanent a saving, both in labor and in coal breakage.

OBITUARY.

The death is announced of Mr. E. L. Gilpin of Sydney, N. S., following pneumonia, at an early age of forty-three years.

Mr. Gilpin was Property Agent of the Dominion Iron and Steel Company, and Secretary of the Employees Mutual Benefit Society. Joining the Steel Company's staff twenty years ago, before the plant was built, he had been in the Company's service for as long a time, if not longer, than any other official or employee. As Property Agent of the Company, he was brought much into touch with the municipal and civic officials of Sydney and district, and took much interest in the civic development of the City. As Secretary of the Benefit Society he was known to all the employees of the Company, and in other directions his activities were varied and extended.

Mr. Gilpin belonged to a family with a long and honorable record in Nova Scotia, his father, Dr. Edwin Gilpin, having been Commissioner of Mines for many years. His grandfather was Dean of the Cathedral of Halifax.

Manitoba Notes

Rice Lake Operators to Form Association.

In order to keep a vigilant eye upon the doings in the Rice Lake field, and also to ascertain its requirements, and if possible supply them, it is proposed to organize a strong association of mining operators, which will include all those now operating and who have received certificates from the public utilities commissioner.

The call has been sent out by Gordon C. McTavish, and the following is a copy:—

"Gentlemen:—A suggestion has been made that the time has arrived for the making of a concerted effort on the part of those having interests in the Rice Lake district, with a view to securing from the Dominion and provincial governments certain absolutely essential improvements.

"Certain interests are already working to this end, but it is felt that representations made by those who are now actively engaged or about to engage in actual mining operations will carry most weight with the proper authorities.

"The suggestion is that there should be formed a small association of mining operators including those now operating and those raising funds for the purpose of operating, and that the members should consist of two officials of each of the companies or syndicates involved. A copy of this letter is being sent to all of the companies operating in the Rice Lake district, which have received certificates from the public utilities commissioner, and in addition, to the Brooklyn Mining Company, Limited, which has not yet put its stock upon the local market, and to the Angus McDonald syndicate, which has raised its development funds by private subscription.

"It is proposed to hold a preliminary meeting in the lecture hall of the Board of Trade building on Friday, November 21, at 4 p.m., and you are urgently requested to be represented at such meeting by two of your officials.

"If you are interested in this project, a line from you to that effect and statement that you will be represented at the meeting above mentioned, will be very much appreciated.

"If any of the eligible companies, syndicates or private owners are omitted, it is hoped that intimation of that fact will be made to the writer before the date fixed for the meeting.

"Yours truly,
"G. C. McTAVISH,
Secretary Gold Pan Mines, Ltd."

THE GET-RICH QUICK BRIGADE.

The following excerpts from an article by "C.A.B." in the mining columns of the Manitoba Free Press have a wider application than the environs of Winnipeg.

"But of all the sickening depravity which the greed for gold is responsible for, perhaps the most repulsive is the subordination of persons who hold positions of trust, and whose conduct previously had not been above suspicion. The favorite game of the baser seller of stocks is to ferret out some journalist who can get their puffs into his paper under the guise of news. They do not as a rule pay him anything in cash—that would be too crude; besides these gentry usually have a very distinct reluctance to parting with real money, but they allow this "press agent" to "underwrite a block of stock" at a low price. It is evidently then his duty to his wallet to boost this stock to such a point that he can sell (something he never paid for) at a profit. To the eternal credit of an underpaid class, it can be said newspaper men who lend themselves to such infamous deceits are few and far between, yet it is most unfortunately true that they exist, and apparently, for a time at any rate, flourish like young bay trees.

And the weak-kneed amongst the news-gatherers are not the only victims of the high priests of the Get-rich-quick cult. There is the man of budding scientific reputation, who standing, perhaps, on the threshold of what might have been a noble career, in a weak moment yields to the temptation of a big cheque and lends his name to reports, that while they help the sale of stock to the ignorant yet effectually debar the signer from the confidence and respect of men whose trust had been worth many gold mines to him, later on. The men at the head of a mining engineering profession are always above suspicion, otherwise they would not receive such princely pay. For instance, John Hays Hammond is known to have been paid $250,000 a year and expenses, for a long period."

It may be said in defence of the journalist that his sins arise more often from lack of accurate knowledge than from deliberate depravity, and truth to tell the wiles of the stock promoter would deceive the very elect.

The Canadian journalist has moreover such an innate fear of "knocking" his district that he unconsciously helps the stock promoter.

Recently, an eminent mining geologist visited Winnipeg, and that part of his address given before the mining men of Winnipeg which referred to the similarity of Northern Manitoba to pre-Cambrian districts in other portions of Canada which had been proved to yield precious metals was given much prominence. The other part of the address, which concerned prospecting and wise investment, was not reported. Was it because the speaker said that no prospect in Canada had ever been developed into a mine by the sale of ten cent stock, and that an investor should set aside a tenth of the money that he intended to invest in a mine for the purpose of getting proper professional advice?

There is a certain town in the West, which defaulted on its bonds, and at one time in its history, the person who had doubts as to the financial sanity of the way things were progressing was intimidated by large bill-posters warning "knockers" to have a care, and dare not open his mouth, no matter how wise his counsel.

Canada is large enough, and rich enough not to fear "knockers," but it has many and grave reasons to fear the giddy, irresponsible and clamant booster.

CANADA'S PER CAPITA WEALTH.

Ottawa.—National wealth of Canada was $19,002,000,000 in 1917, ranking the Dominion sixth among all countries. This shows per capita wealth of $2,375, the highest of any country on the figures used, and most likely the highest on any current estimates of world wealth now available.

Nova Scotia Notes

The Bonar Head Colliery of the Dominion Coal Co.

The Dominion Coal Company announces that its engineers are surveying the route for the branch line from the Canadian National Railway to Bonar Head which is projected to give access to the site of the proposed new undersea colliery at that place. The completion of this railway is a necessary preliminary to the commencement of any heavy construction work or shaft sinking. As the Winter has now set in, the construction of the new branch railway is not likely to be undertaken until the Spring.

It is understood that the plans of the Dominion Coal Company's engineers contemplate the sinking of a shaft to the Sydney Main Seam, presumably as near to the coastline as seems advisable, and then driving out seawards to intersect the undersea continuation of the Main Seam by two cross-measure, or "stone" tunnels having a slight inclination in favour of the load. If the Dominion Company contemplates the extraction of coal to the maximum seaward extension of its leased areas, it will be necessary that the size of the shaft and tunnel openings shall be unusually capacious, and the construction work of very permanent and therefore quite costly character. The thickness and quality of the coal seams in the vicinity of the proposed new opening are not definitely known, and the character of the seams in the undersea area are necessarily a matter of conjecture, as no opening has yet been made upon this virgin territory.

The extent to which the Dominion Company will develop the undersea leases in the vicinity of Bonar Head will naturally depend upon the thickness and quality of the Sydney Main Seam and the other seams overlying and underlying it, so that it seems unlikely that the full programme of development announced in the newspapers will be undertaken until more is known of the physical characteristics of the coal in the undersea area. As the coal leases to the coastal barrier are held by the Nova Scotia Steel and Coal Co., the site of the new colliery will overlie the leased coal of the Scotia Company, and the permission of the Scotia Company will be required before the work of sinking the shaft and driving the tunnels is undertaken. This, however, is purely a formal matter, the procedure for which is prescribed by the Mines Act, and it is not to be expected that any difficulty will arise in this particular.

In view, therefore, of the necessity to build the branch railway, of the advisability of thoroly testing the character of the coal seams in the Bonar Point area before committing itself to a very large capital expenditure, it seems probable that much preliminary work will require to be done before any appreciable output of coal is secured from the undersea leases in this neighbourhood. The officials of the Dominion Company state that at least twelve months will elapse before coal is shipped from the projected colliery.

The Dominion Coal Company has requested permission from the Department of Immigration, which it is understood has been given, to bring in a number of miners from Belgium, France and Italy, to replace the men who went home to fight in 1914. In August and September of that year, some 800 miners answered the mobilization call and returned to Europe, including a number of British reservists. While the number of men on the Coal Company's payroll is of course much less than it was at the time of maximum outputs in the early portion of the war period, the deficiency is almost altogether in the men employed in producing coal at the face, a condition that more than anything else tends to high costs of production and restricted outputs.

Dominion Coal Outputs.

The production of the collieries of the Dominion Coal Company during September and October was as under:

Colliery.	September.	October.
1	21,733	29,378
2	47,679	53,388
4	26.234	28,462
5	5,984	7,050
6	18,284	19,420
9	21,909	25,202
10	9,005	11,587
11	14,139	14,869
12	15,674	16,265
14	14,872	18,510
15	10,328	12,892
16	12,609	14,834
21	11,670	13,247
22	12,508	15,411
	242,628	280,615
Springhill No. 2	33,599	34,410
Springhill No. 6	1,232	1,491
	34,831	35,901
Total	277,459	316,516

The Managers of the Dominion Collieries.

As a large number of changes have recently taken place in the positions of manager at the Cape Breton collieries of the Dominion Coal Company, the following list of the managers of the individual collieries, as the present time, may be of interest.

1.....John Monroe. A. D. Matheson, Ass.
2.....P. T. Prendergast.
4.....John Casey.
5.....W. G. Ross.
6.....W. T. Chew.
9.....D. J. McCuish.
10.....Thomas McDonald.
11.....N. A. McDonald.
12.....A. R. McDonald.
14.....H. A. MacLeod.
15.....W. D. Haley.
16.....James Connors.
17.....John P. McIntyre.
21.....John McIntosh.
22.....Robert Simpson.
24.....James Moseley.

Nova Scotia Steel and Coal Company's Production.

The output of the Scotia collieries during September and October 1919, and the corresponding production in 1918, is as under:—

	1919		1918	
	September	October	September	October
Princess	14,485	15,320	10,520	10,601
Florence	20,239	21,913	11,962	14,327
Scotia	7,926	8,184	7,287	7,002
Jubilee	9,708	11,090	10,182	11,516
	52,358	56,507	39,941	43,446

The Government has placed an embargo on the export of coal from Canadian mines, in consequence of the serious situation occasioned by the strike of the bituminous coal-workers in the United States. This is a natural action, but it does not necessarily mean that water exports will be stopped, because transportation difficulties will prevent the full relief of Canadian coal production being applied to Canadian needs. The situation throws into high relief what the founders of the Dominion Coal Company always fully realized, namely that the development of Canadian mines is chiefly a matter of seasonal transportation. The coal mines of Nova Scotia are always forgotten and despised until outside sources of supply are interfered with, and then, this neglected province becomes a centre of great solicitude. There are people in Toronto who confuse Nova Scotia with Nova Zembla.

WANT CHANGES MADE IN MINING ACT.

Meeting in Toronto will discuss proposition submitted by Port Arthur Board of Trade—Nipissing Extension's program of development —Progress made at the Keora mine In Porcupine.

(From Our Toronto Correspondent.)

At the annual meeting of the Associated Boards of Trade and Chambers of Commerce to be held in Toronto Nov. 20 and 21, there will be discussed a resolution adopted by the Port Arthur Board of Trade which has a good deal of bearing on the Mines Act of Ontario. The resolution provides, amongst other things, that the recorder of a mining division have the power to issue special renewal license; that patents be issued for claims or parts of claims covered by water, where it can be shown that the granting of such patent will not interfere with navigation; that patents instead of leases be granted for mining locations in Crown forest reserves and timber berths where prospecting is permitted; that the assessment work consist of $100 worth of actual mining work per 40-acre location per year, for a period of three years, when a patent shall be issued at the usual price per acre; that the assessment work may include cost of survey, not to exceed $100 per location, and in the case of an iron location may include the cost of a magnetic survey; that in the case of claims taken up for iron and iron pyrites the assessment work may be applied on one or more of ten continuous claims and that the unorganized portion of the Fort Frances mining division be administered by the mining recorder of Port Arthur.

Starting their development work last February, the Porcupine Keora Mining Company, Limited, composed of Toronto and Philadelphia interests, has already spent $70,000 in buildings, shaft-sinking and diamond drilling on their property in the Township of Whitney, Porcupine district. The work was carried on in order to test the northern ore body. To develop the low grade ore bodies will require an expensive plant and the company is not in a position to instal it, so they are starting with the high grade ore and from the treatment and sale of it will raise enough money for the company's own mill. An extensive drilling campaign has just been completed and according to the statement of the mine manager Nos. 1 and 2 diamond drill holes are down to 905 feet and 997 feet and Nos. 4, 5 and 6 were put down to 350 feet, while No. 7 is down to 1,000 feet, with the result that No. 1 vein, which was the objective in deep diamond drilling, has been proven to contain the same values at the depth as are shown on the surface. In putting down No. 2 hole 76 feet below the surface, a new ore body was encountered which is now known as No. 5, and shows average width of 9 feet and an average value of $17.44. This discovery caused the company to put down Nos. 4, 5, 6 and 7 holes over a total length of 700 feet and the results show an average grade of ore of $20 to the ton, except in No. 4 hole, where the highest assay obtained was around $12.00. The results of this diamond drilling encouraged the company to commence sinking a shaft to open up Nos. 5 and 6 at the point cut by the No. 5 hole, where vein No. 5 is shown to be 20 feet wide and averages $110 per ton. No. 6 vein, 100 feet to the north, which will be opened up in the same work, shows 10 feet of $47.56 per ton. The money is in the treasury to cover the cost of bringing the mine to a producing stage and it is expected that in five months' time the minimum production of 25 tons daily will be coming from No. 5 vein, netting the company between thirty and forty thousand monthly, according to the statement of the mine manager.

The Northern Securities, Limited, are in receipt of encouraging reports regarding the development program in prospect for the Nipissing Extension Mines, Limited, whose property of forty acres is situated in the Peterson Lake area of the Township of Coleman. According to the report Major E. H. Birkett, the resident mine manager of the mine is now in Cobalt in complete charge of the property and has commenced a careful campaign for development. His reports concerning the property and its possibilities are very favorable and he further reports that he has recently discovered a new vein on the Nipissing Extension which had never before been located. This discovery, he says, has been stripped for sixty feet and it averages one inch wide of smaltite and cobalt bloom. The wall rock carries leaf silver. The report states that the vein has been assayed and proved to carry 830 ounces of silver to the ton, while the wall rock carries 115 ounces of silver to the ton. The company bases its faith in the property on the richness of the veins as found by Consulting Engineer Strong.

Davidson Consolidated is announced to have extensive plans for the future. A townsite is to be laid out, a church and schoolhouse built, as well as a number of additional cottages for the accommodation of married employees. Timber is now being cut for these at the company's sawmill. A large addition is to be made to the mill building to accommodate additional equipment to bring capacity to 500 tons a day.

It may be laid down as an axiom that no modern nation can retain economic independence unless it possesses within its frontiers a sufficient supply of bituminous coal.

Coal is the motive power of civilization.

As this war and its preliminaries have abundantly demonstrated economic independence sooner or later spells political subservience.

The national future of Canada, its maintenance of national integrity and its political independence is bound up with the coalfields of Cape Breton Island.

Extent of territory, density of population, and agricultural wealth are only a menace if coal is absent.

In these times coal spells power, it is a necessity of nationhood.

—Extracts from a paper by the Editor, read before Mining Society of Nova Scotia, April, 1917.

AN UNUSUALLY PLACED METALLURGICAL LABORATORY.

Our metallurgical readers will be interested in the following account from the "Westporter Herald" of the Dorr Company's new laboratory and consulting offices near Westport, Conn., which Mr. Dorr has combined with a bird and small game sanctuary. This is a novel and praiseworthy example of the ruralization of industry.

About two miles from Westport, at the confluence of the Saugatuck and Aspetuck rivers in a picturesque stretch of woodland is an old mill which has been a landmark since the early days of the town. Built in pre-Revolutionary times when water power was a necessary part of business equipment, the mill was used for spinning, its operative force being brought from England. Owing to changes wrought by time and circumstances, it was transformed about seventy years ago into a grist mill and was known for miles around as Kelly's Mill to all the farmer folk who journeyed thither with their bags of grain from the season's harvest. Continuing to operate as a grist mill, it again changed ownership when considerable improvement in equipment was made and it became known as Sipperley's Mill. Two years ago the property was purchased by the Dorr Company, a large engineering and metallurgical research firm with offices in New York, Denver and London, England. The scope of the work at Westport includes analyses; extended research along various lines, and the investigation, development, testing and improvement of industrial, chemical and metallurgical processes. The mill has been entirely remodelled and refitted with an attractive library and conference room, sleeping accommodations for transient business visitors, a completely equipped analytical laboratory, and a testing plant of commercial scale tests along many lines. Surrounding the mill both up and down the two rivers is a tract of land consisting of forty-six acres, some in meadows and hillside, some in pond and waterways and the rest in natural woodland. Along the streams and in the meadows all kinds of birds native to New England are to be found in large numbers, likewise much small game. The rare wood ducks are here and the shy Heron, with thrushes and wood robins and all the little feathered songsters which seek the quiet of the undisturbed forest.

Last spring, through the untiring efforts of Mr. Herbert Fox and the generosity of Mr. Dorr, and their co-operation with the Nature Club of Westport, the services of Mr. Wilbur F. Smith, state game warden, were secured and through him the property was leased by the state for a Bird and Game Reserve and is now protected by state law from all hunting, either shooting or trapping, and is under the jurisdiction of Mr. Smith and the care of the Nature Club. Mr. Dorr has asked the Nature Club to establish feeding places and to put up bird houses. These have all been occupied this past summer, demonstrating clearly that the birds readily accept the offerings of their human friends.

The Junior Audubon Club of Westport, which numbers about four hundred members, will be glad to know that there is a bird reservation so near and the Nature Club hopes they will keep up their interest in observing and protecting the birds. A plan is being made for them all sometime to visit with their teachers this lovely natural bird retreat where may be seen so many birds which are too shy to venture away from the quiet wood, and also the five deer which have joined the wild colony at the Old Mill.

The townspeople, too, are asked to take an interest in this movement to protect the birds and game which so many times are thoughtlessly and ruthlessly destroyed and to assist the Nature Club by donations of suet, seed, nuts and grain for feeding during the cold winter months. Information regarding feeding and the making and placing of bird boxes may be obtained at the Public Library and any suggestions or advice from personal observation and experience will be gratefully received by the Nature Club, which looks for the hearty co-operation of all friends of birds and game to perpetuate this Preserve and show the appreciation which should be extended to Mr. Dorr for making it possible to have so beautiful a spot as this for a Bird and Game Reservation in our own town.

"BORE FOR POWER!" SAYS SIR CHAS. PARSONS.

In an address recently delivered in London, Eng., Hon. Sir Chas. A. Parsons, inventor of the Parsons turbine, said that "failing new and unexpected discoveries in science, such as the harnessing of the latent molecular and atomic energy in matter, the great position of England cannot be maintained for an indefinite period. At some time or other, more or less remote, the population will gradually migrate to those countries where the natural sources of energy are the most abundant."

England is using up its coal more rapidly than most other countries, and Sir Charles states that long before it reaches the point of exhaustion, it may pay England to import coal from countries where it is workable at lower cost. Ultimately water-power will be more rapidly developed, although the cost of harnessing all the water-power of the world would be about £8,000,000,000.

What shall England do to be saved from the disaster threatened by the exhaustion of its coal and the competition of other lands with plenty of cheap power? Sir Chas. Parsons' advice may be summed up in the one word: "Bore." There may be cheap power waiting, ready to be tapped, down deep in the crust of the earth, he says.

He recalled that some years ago he suggested boring a shaft 12 miles deep, or about 10 times deeper than any in existence. At that time the cost was estimated at £5,000,000, and the time that would be required at 85 years! Since then, he added, experiments have been made, showing that in limestone a depth of 15 miles is probably practicable, and in granite a depth of 30 miles might be reached.

"Little is at present known of the earth's interior," said Sir Charles. "When we consider that the estimated cost of sinking a shaft to a depth of 12 miles at present-day prices is not much more than the cost of one day of the war to Great Britain alone, the expense seems trivial compared with the possible knowledge that might be gained by an investigation into this unexplored region of the earth."

In Italy, at Lardarello, he said, bore holes have been sunk which discharge large volumes of high-pressure steam, which is used to generate about 10,000 h.p. by turbines. A similar project is on foot near Naples to supply power to the great works in that district.

Without promising that a 12-mile bore hole in England would yield ready-made steam-power, Sir Chas. Parsons urged that "the whole subject merits the most careful consideration."

THE PROSPECTS OF RAILROAD ELECTRIFICATION IN AMERICA AND ABROAD.

By F. H. SHEPARD*

The world-wide shortage of coal during the great war has emphasized more clearly than ever the necessity of fuel economy in industry, while the present shortage of labor and the certainty of its continuing scarcity throughout the construction period forms another most serious problem. But fortunately we have at our disposal a means that will greatly assist in alleviating both of these conditions; namely—electrification.

The use of electricity in industry saves both fuel and labor. This fact is recognized throughout the world today and in order to secure these advantages, practically all of the nations are now considering plans for the electric generation of power. In England, Belgium and France, among others, these plans are being prepared by official commissions, so that a tremendous activity in electrical power development may be expected with the stabilization following the advent of peace. In all cases, the ideal in view is a broad one: To use electricity for all possible power purposes, including railroad operation.

The operation of the railroads will naturally form an important part of any program of general electrification, for in almost every country the railroads form one of the largest users of fuel and labor. Nor are the advantages obtained from railroad electrification limited solely to economy in fuel consumption and the more effective use of labor. Among others, the following can be mentioned:

1. Greater speed of movement for the heaviest trains, due to the fact that electric locomotives can be made much more powerful than the largest steam locomotives.

2. Greater nicety of control.

3. Increased traffic capacity of existing tracks, terminals, grades, tunnels, and other points of traffic restriction, because when electricity is used, heavier trains can be operated at higher speeds and less time is consumed at terminals and in yards.

4. Operation where the use of steam is impossible or objectionable, as in long tunnels.

5. Independence of weather conditions, since the electric locomotive is not effected by cold weather.

6. More reliable operation, as proved by the statistics of all existing electrifications.

7. More effective use of all rolling stock, due to more expeditious movement of traffic.

8. These are some of the advantages that are now being obtained for the mere substitution of the electric locomotive for the steam locomotive, but they by no means tell the whole story.

Consider electric illumination. When first introduced, the electric lamp supplanted a gas or an oil light because of certain advantages it possessed, and at first it occurred to no one that it would ever do much more. But the electric lamp has within thirty years revolutionized illumination and has given us our light-flooded factories, with their greatly increased production and safety, and our Great White Ways as well.

A further example is the growth of our great city and interurban electric transportation service of today from the substitution of the electric motor for the horse on street cars.

There is good reason to expect that the electric operation of the railroads is capable of a similar development and will in time revolutionize our present transportation methods and provide us with services we know little or nothing about today.

Since the United States has an abundance of coal, railroad electrification here has been determined solely by local conditions. Passenger terminal problems caused the electrification of the New York Central at New York and the Pennsylvania at New York and Philadelphia. The limitations of the steam locomotive determined the electrification of the Baltimore tunnel on the Baltimore & Ohio, the Cascade tunnel on the Great Northern, the St. Clair tunnel on the Grand Trunk, the Hoosac tunnel on the Boston & Maine and the Detroit River tunnel on the Michigan Central. Examples of electrified railroads with freight as well as passanger service are the Norfolk & Western, the Chicago Milwaukee & St. Paul and the New York, New Haven & Hartford.

While the other electrifications are successful and interesting, the last three are more properly representative of general railroad electrification. The Norfolk & Western is an example of electrification under the heaviest conditions of freight traffic on a mountain grade. The Chicago Milwaukee & St. Paul has in operation the longest continuous mileage in the world, and when completed will cross five mountain ranges. The New York, New Haven & Hartford has a very large movement of both freight and passenger traffic. All three installations are successful and profitable and, when financial conditions are stablilized and the American railroad question settled, it is expected that all three will extend their electrified service.

In addition there are sections of railroads about the country where the present congestion of traffic or the availability of water-power warrants the early adoption of electric power. These possibilities alone promise under normal conditions of finance (as no engineering problems now remain to be solved) extensive activity in the electrification of railroads for many years to come.

Different from America, European and South American countries, with the exception of England alone, lack an adequate supply of fuel, but many of them including Norway, Sweden, Switzerland, Italy, Spain and Brazil, have large amounts of water power, while France has a moderate amount. These resources combined with the high cost of fuel make extensive railroad electrification in these countries inevitable sooner or later.

The neutral countries will probably be the first to undertake this work, Switzerland having a program covering a term of years well established, while both Norway and Sweden are giving active consideration to definite projects. In England, a considerable amount of electrification is in contemplation along with the general plan for the electrification of industry. A French Commission, composed of Government and railroad engineers, have already visited the United States in order to thoroughly familiarize themselves with American practice. The Italian Government will continue their definite program as soon as financial conditions permit. An official Belgian Commission is already planning to rehabilitate with electric power at least a portion of the railroads destroyed by the

---

* Director of Heavy Traction, Westinghouse Electric & Mfg. Co.

Germans. In Spain, Brazil and South Africa as well railroad electrification is under active consideration.

It is evident, therefore, that the next decade will see a large amount of railroad electrification in almost every quarter of the world.

MEETING OF TORONTO BRANCH OF CANADIAN MINING INSTITUTE.

New Provincial Minister of Mines Addresses Institute Members.

Reports from Toronto of the meeting and dinner of the Toronto Branch of the Canadian Mining Institute on Saturday, at which Minister of Mines Mills and Attorney-General Ramsey were the specially invited guests, were reassuring to representatives of the mineral industries of Ontario. The new ministers, while not obligating themselves to do other than deal fairly with all classes and industries, proclaimed their purpose to promote economics and encourage capital.

Mutual felicitations and pledges of co-operations were exchanged. President Tyrrell voicing the sentiments of the mining fraternity, and Minister Mills frankly admitting his earnest desire to have Ontario in general and the Fort William district in particular retain the premier position. In so doing the Minister of Mines reviewed the out putting statistics of the current year and manifested a knowledge of the situation that evoked applause. He argued for increased production while humorously declaring that "it is a long way from the 'cab' to the cabinet," he being a locomotive engineer.

Professor Miller was most optimistic as to the future of North Country and ventured the projection that "there are more Cobalts and more Porcupines." He also directed attention to the fact that the nickel industry despite its adversities in the earlier years of its development, is the greatest of its kind and merited pride as such.

Messrs. Tyrrell and Haultain complimented the Ministers upon their plain-speaking. Among the business transacted was the election of Mr. Clifford E. Smith to the presidency of the Toronto branch, and the decision to invite the Canadian Mining Institute to hold its next annual meeting in Toronto.

"A SCHOOL REUNION."

Toike-Oike.

A reunion of the graduates of the School of Science and of the Faculty of Applied Science and Engineering is to be held in Toronto on the 12th and 13th of December. This reunion has aroused a great deal of interest among the alumni all over Ontario and at more distant points, and advanced indications are that almost all good school men will be on hand. A live program is being prepared to cover the Friday evening and all of the Saturday. Special railway rates are being secured from all points in Canada.

It is considered desirable to gather the alumni of the old school together at this time to renew the friendship and acquaintances of "Varsity" days upon which time the war has made great inroads. It is essential that any university or college that desires to stand in the front ranks of educational institutions should have a strong, active alumni, and this reunion is planned with a view to consolidating the existing wealth of school spirit into an organization of that kind.

The alumni will be pleased to welcome the new dean, and to hear from him his hopes and his ideas for the future conduct of the school.

The move for a reunion has been most enthusiastically received wherever broached and the committee is endeavoring to get in touch with all graduates, but as the present list of addresses is very incomplete, they are unable to reach all of the graduates and will be pleased to send full details of the program to any alumnus on request to Mr. Joseph Bannigan, 7 King St., East, Toronto, Ontario.

NICKEL COINAGE ADVOCATED IN CANADA.

It must always remain a puzzle why Canada, the world's main producer of nickel, yet neglects to utilize the metal for coinage. If only for sentimental purposes, the official use in this way of such a typically Canadian metal as nickel would be most appropriate. But quite apart from that, it would be good business, for by the introduction of nickel 5-cent pieces, and for that matter also 10-cent pieces, in place of the present silver coins, the national treasury would effect a very considerable saving, certainly amounting to two or three hundred thousand dollars annually at the present high price of silver. Then again there are a variety of purposes, such as for cooking utensils, for which nickel and its alloys, notably Monel metal, are eminently suitable, not merely as a substitute for other metals, but owing to superior wearing qualities, cleanliness, and generally more "finished" appearance. These features would go far to outweight the somewhat higher initial cost, and owing to its longer life the nickel article would probably be found to be little or no more expensive in the long run. We need an active campaign to popularise the use of nickel and its alloys, and this is especially true now that the refining of nickel has taken its place as a firmly established home industry.—Canadian Mining Institute Bulletin.

A SILVER PROPHECY.

In view of the record figure to which the price of silver has recently risen it is of interest to recall that an era of permanently dearer silver was predicted in a work on "Peace Problems in Economics and Finance," of which a second edition was published in February, 1918. In his preface to that edition the author, Mr. Uriel d'Acosta, declared that "the era of cheap silver, which has lasted about thirty years, has come to an end," and that "a permanently higher value for the metal has been established." The change in the value of the white metal, he contended, was the consequence of the impoverishment of the West and the greater prosperity of the East. Gresham's law, he added, applies itself to the whole of Western civilisation in driving silver to the East as a result of inflated paper currencies. In view of the European demand for silver for currency purposes and for the industrial arts it was hardly likely, in Mr. D'Acosta's opinion, that the value of silver will for many years to come be much less than it was in 1913. These prophecies, we think, form a rather striking example of what Lord Curzon once described as intelligent anticipation of events before they occur.

A MARSH HOIST

Is Made the Right Size For Your Mine

Hoists For
STEAM,
ELECTRIC,
or
GASOLINE
POWER

From the little 10 Horse Power size for prospectors or small mines, to the massive 50 H. P. size, one of our 7 sizes should be just right for your mine.

We are specialists in the designing and building of Hoists. For nearly a quarter of a century we have been concentrating on this work, and have developed a Hoist that we know we have reason to be proud of.

From one end of Canada to the other they are in use, and doing good work in Mines, Quarries, and other classes of work.

We also design special Hoists for special needs, and the experience we have been accumulating through all these years is at your service to enable you to equip your mine with just the Hoist you want.

We also Make
MINE CARS,
CAGES,
BUCKETS,
SHEAVES and
DERRICK PARTS

SALE OF

Military Stores, Etc.

DRY GOODS, HOSPITAL FURNITURE, BEDDING, HARDWARE, LEATHER GOODS, JUNK, ETC.

SALES WILL BE MADE BY SEALED TENDER

Persons desiring to tender are requested to register their names and addresses with the

SECRETARY OF THE WAR PURCHASING COMMISSION, BOOTH BUILDING, OTTAWA,

stating the class of goods in which they are interested, whether new or second second-hand or both.

Tender forms with full details of the goods and places at which samples may be seen, will be mailed when ready to those who have registered as requestd above.

Special Terms to Hospitals, Etc.

Dominion, Provincial, and Municipal departments, hospitals, charitable, philanthropic, and similar institutions which are conducted for the benefit of the public and not for profit may purchase goods without tender at prices established by the War Purchasing Commission.

Returned Soldiers and Sailors and Widows and Dependents of Soldiers and Sailors killed in the War may obtain supplies, for their own personal use and not for re-sale, through the nearest branch of the Great War Veterans Association who will combine individual orders and forward to the War Purchasing Commission through the Dominion Command of the Great War Veterans Association. These services are rendered by the Great War Veterans Association to all parties in the classes named, whether members of the Great War Veterans Association or not.

All communications should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

EDITORIAL

Are the Programmes of Technical Society Meetings too Crowded ?

A characteristic of recent meetings of technical societies, notably the September meeting of the American Institute of Mining & Metallurgical Engineers in Chicago, has been the bewilderingly large number of papers presented, the wide range of subjects dealt with in these papers, and the very specialised character of some of the subjects dealt with.

The state of mind of the man who conscientiously should try to compass the whole programme—or even that part of the programme in which he is specially interested—varies between amusement and despair, according to his temperament.

If one is of a social nature—conviviality being now an archaic term—he frankly abandons the attempt to attend the reading of papers and the discussions arising out of them, and betakes himself to the lighter diversions provided, promising that when he gets home he will read the papers—which he never does.

When, as now seems to be the prevailing mode, societies with associated interests have sideshows of their own, coinciding in time, but not in place with those of the major meetings, then one begins to see some advantages in what our theosophical friends term functioning on the astral plane .

Has not the multiplication of sections, the variety of subjects dealt with in the papers, and the number of coincident attractions rather exceeded the useful and practical limit at metropolitan meetings of technical societies in Canada and in the United States?

It will be conceded that the discussion on a paper, and not the actual reading of a paper itself, is the more profitable proceeding, except on those rare and outstanding occasions when some epoch-making improvement of practice is announced by the man who perfected the improvement, possibly as the crowning point of years of hard work.

A commendable innovation at the Chicago meeting referred to was the use of the symposium, which consisted in the combined discussion of a number of papers relating to phases of one general subject. A fine example of this method was the symposium on sulphur in coal. In this case, a number of papers, many of them previously printed in the Bulletin, were reviewed in a general discussion—a worth-while discussion.

As a further improvement on the symposium method it may be suggested that at the average metropolitan meeting a judicious selection of four or at the outside six important papers would provoke really worth-while discussion, always provided that such papers had been previously printed in the Bulletin, and that the persons attending came prepared to discuss the subject selected after due deliberation and preparation. Written discussion would also be invited from those unable to be present.

The logical result of the method suggested would be that presentation of new papers at metropolitan meetings would not be asked, but that a signal honor would be conferred on the authors of a few papers, previously read at branch and local meetings, selected because of their merit, and because of their bearing on present and pressing problems.

In this way, concentration of thought and energy would be achieved, in place of the existing dissipation of mental effort, which leads either to negation or to superficiality.

From the point of view of a society secretary there is some objection to the change suggested, inasmuch as the metropolitan meetings are largely relied upon to provide the matter for annual transactions of respectable dimensions, but the question may be asked, should not the proceedings of the branches and technical sections provide a sufficient mass of material from which to cull a collection of annual transactions meriting publication?

There is, of course, another viewpoint, for which there is much to be said, which is the frank admission that the annual metropolitan gatherings of technical societies are really social functions, which would compel the conclusion that the solid work of reading and discussing papers should be done throughout the year in the branch meetings. If this admission is made, it discovers an added reason why the papers at the larger gatherings should be reduced to a few previously published, selected for discussion, rather than for initial presentation. There is also the consideration that authors of papers representing possibly months of work and years of observation will not be disappointed at the meagre audience and distracted attention which so often is the lot of persons who present their papers in person; especially as the qualifications which fit a man to prepare a technical contribution of merit do not necessarily coincide with oratorical gifts.

These considerations are set forth for discussion. Like many society papers, any merit they may or may not possess would be revealed by discussion. No destructive or captious spirit has suggested their postulation, and, to avoid misunderstanding, it may be stated that no particular technical society is referred to, the tendency which is herein criticized being very general.

The "Journal" would be glad to receive and publish any comment which the considerations put forth may suggest to its readers.

Workmen's Compensation in Great Britain

A Committee appointed by the British Home Office is at the present time seeking information on the working of the Compensation Act there, and on the desirability of establishing a state scheme of insurance against liability for compensation payments. In making preliminary enquiries from the coal industry, which has been selected as one of the best organized trades, it was found that because of the very high premiums charged by private offices, the Coal Controller had for some time had under consideration some relief from the onerous burdens of the existing situation. As the premium rate paid to private insurance offices is reckoned on the payroll, and as the rate of wages paid today is at least one hundred per cent higher than it was some years ago, it follows that compensation premiums have increased in the same ratio, while at the same time the risk had not substantially increased. Herein is exposed one of the many weaknesses of a compensation law which permits of private insurance against a liability imposed by national legislation. There is no justification for permitting private companies to make profit out of a statutory liability. The insurance companies in Great Britain are powerful institutions, and it may well be, as was the case in the State of New York, that they have exerted and will exert their influence to prevent the coming of a state system of compensation insurance.

In the matter of workmen's compensation legislation Great Britain was a pioneer, but legislation in that country has not kept pace with Canada and the United States inasmuch as the system of lump sum payments is adhered to, recourse to the courts in cases of disputes is allowed, and no proper system of pensions has been elaborated.

The method adopted in many of the provinces of Canada and most of the States of the American Union, of administration by a State Board, having judicial powers of decision, eliminating all common law liability and all recourse to the courts, having its own medical officers and avoiding all possibility of dispute between the injured person and his employer, is in every way to be preferred to the existing arrangement in Great Britain.

The inadequacy of lump-sum payments of compensation in cases of fatal injury must be admitted by all who have given dispassionate consideration to the position of dependent wives with large families. Insurance companies themselves have found it necessary to advise the payment of insurance benefits by an arrangement of monthly pensions in lieu of large single payments at death. The amount of compensation payable to the dependents should be as far as possible pro portioned to their need, and the wife with one or two or no children is in a very different position to the woman who is left with a large family of young children. A fixed payment at death cannot fill the necessities of varying circumstances, but a system of monthly payments based on the number and age of the children left dependent does permit of adaptation to the necessity of individual cases. It is difficult to understand how the lump-sum payment of compensation for fatal injuries, and compensation liability insurance through private offices has survived so long in Great Britain, and it can only be attributed to the fact that the labour leaders in that country have been following the will o' the wisp of socialism and other jack-o'-lanterns such as nationalization of mines instead of bending their energies to the accomplishment of practical reforms within reasonable compass of attainment, and already on the statute books of countries within the Empire.

In regard to the premium which an insurance company must ask for insurance against colliery disasters, it is quite evident that this must be high, because while the accident death rate of mineworkers averaged over a term of years and over all men employed in the industry is not relatively higher than many other trades in which the accident risks are popularly regarded as being ordinary, the gravity of the risk consists in the possibility that a large number of men in one mine may be killed at one time. The risk is a concentrated one, and the obvious course to minimise such a risk is to spread it over the whole industry and over as long a term of years as possible. This is exactly what disbursement of compensation payments through a state fund derived from collective assessment achieves. The method seems excellently well suited to equalise the peculiar risks attaching to the compensation liability of colliery enterprises, and its economy is undoubted, because a state board disburses exactly the amount prescribed by the Compensation Act, and no more, plus a negligible percentage for administration costs.

The By-Product Coke Ovens at Anyox B. C. and the Cassidy Colliery of the Granby Consolidated Mining and Smelting Company

By Our Victoria Correspondent.

To the enterprise of the Granby Consolidated Mining & Smelting Co. is to be credited the giving to British Columbia of the first important by-product coking plant on the Pacific Coast. The project, which was started during the war, was completed only a few months ago, the obstacles which were encountered, first in respect to the clearing of the necessary site at Anyox, the Company's mining centre on the northern Provincial coast, and second in the obtaining of material when what was required was at a premium in Europe, impeding progress somewhat more than was expected. Each difficulty however was surmounted and the modern 30 oven coke and by-product plant stands a monument to the faith of this great Company in the mineral possibilities of Canada's most westerly Province.

On July 9th of this year the first big red-hot cake of coke, measuring nearly nine feet high, forty feet long and nearly eighteen inches in width was pushed from one unit of the oven into the waiting car to carry it to the quenching station. That product, it is to be noted, was the first output of an installation which represents an expenditure of approximately $5,000,000, if the plant at Anyox and its attribute, the coal mines of Cassidy, Vancouver Island, are both considered. The coal used in the ovens under discussion comes from Cassidy, it should be understood, where the Company, having acquired coal lands, developed them, installed equipment modern in every respect, built houses for its officials and for its men that are unequalled in the provision made for the well being of employees on the continent. These mines now are producing consistently, the output is shipped by barge to Anyox and there converted into coke for the operation of the Company's smelter.

Of Anyox and its mines and its smelter, which contain the biggest copper converters in all of Canada, much has been written. The town itself and its works today represent an expenditure of practically $8,000,000. Of this amount more than one half was spent before the Company marketed a single pound of copper to the world. To keep the smelter going huge quantities of coke were purchased from the ovens of the Fernie district. Sometimes strikes, which happened too frequently, made the problem of copper production one of endless worry and great expense. At one time the Company was forced to bring its coke from Pennsylvannia. Hundreds of thousands of fuel oil have been transported to the northern camp.

Coke troubles, by virtue of the plant now in operation, are settled, while the vast amount of gas that is saved will be used in firing boilers in power houses when hydro conditions become such that water power is stilled by the lowering temperatures and ice. For the by-products there is a steady market.

Contrary to impressions which have been apparent this coke plant is not of foreign design. Every element of it is the product of the inventive genius of inventors of the North American Continent and every particle of material in its construction was fabricated in Canada, and much of it in British Columbia. The contract for its construction was taken over by the Foundation Company Ltd., of Montreal, and it may be said to be an "All British Product". Only such material as it was possible to obtain in Canada has gone into its construction while the army of skilled artisans who put it together was brought from all sections of the Dominion.

The construction work of the big coal bins, the offices, the huge stacks, the coke ovens themselves, the big gas holder, scrubber and benzol plant, by-products house, all are of concrete, presenting an imposing sight by day and marked by night by immense gas torches where the overflow of fuel burns incessantly. The plant entire spreads over several acres, room for which was blasted out of solid rock, or filled in with the same material. On an eminence to the north stands the smelter, while between the smelter and the coke plant lies the town of Anyox, and up the valley of Hidden Creek are the mines which furnish the ore. Viewed from the waterfront Anyox represents a big industrial concern where two thousand or more skilled workmen ply their vocations for twenty-four hours each day, working in eight hour shifts. The reaches of Granby Bay skirt the town limits, and docking facilities bring the coal from Cassidy almost to the open maw of the coke ovens.

F. M. SYLVESTER
Managing Director, Granby Consolidated Mining & Smelting Company.

Encased in brick of many and peculiar shapes, brick made by a special process, and under the heat of which ordinary fire brick would fuse, the ovens, thirty in number, spread over an area of more than 200 feet and are more than twenty feet in height. It is scarcely necessary to say that the by-product coking ovens create the coke by an entirely different method to the "beehive" ovens which are in use in the Crow's Nest Pass District. No flames touch the coal in its raw state, the fuel passing through flues made of the special brick referred to which so heats the oven walls so as to make them incandescent, thus forcing the coal to throw off its wealth in by-product.

In the carbonization of coal, which is accomplished by the application of heat at 2,400 deg. fahr. the coal gasses are driven off from the ovens to the collecting main, a large "U" shaped steel tank running the full length of the ovens and connected from each oven unit by ascension pipes. Through the collector main gases are conveyed through a series of piping to the by-product house where the gasses go through a condenser. It this condenser the temperatures are dropped, causing the precipitation of the tar and ammonia vapors. The gas then passes through the exhauster to the tar extractor where the remaining tar and ammonia is recovered.

The tar from the condensers and from the tar extractor flows to a tar separating tank and in this tank the tar and ammonia liquors are separated by gravity, the tar flowing to the tar storage tank and the ammonia liquor to the ammonia liquor receptacle. The ammonia liquor is then sent to the Ammonia Still where it is driven off in the form of gas which combines with the gasses leaving the tar extractor and all gases are then sent to the Saturator. In the Saturator the gases pass through a bath of sulphuric acid, the ammonia combining with the acid, forming ammonia salts, or ammonia sulphate. These salts are deposited in the Saturator, then conveyed to a draining table, and when a sufficient amount of salts have been collected it is placed in centrifugal dryers and the moisture driven out. Then the Ammonia Sulphate is ready for the market.

The operation at the by-product houses being completed all the gas passes to the final cooler in the benzol plant where the following by-products are obtained: Benzol and its homologues, which are toluol, solvent naphtha, crude naphtha and xylol. In the cooler the

General office, Cassidy Colliery, Vancouver Island.

gas is brought into direct contact with a water spray, and the naphthalene, as a result of the cooling gas, is carried off into a settling tank where the naphthalene floats to the top and is there skimmed off. The gas then goes from the final cooler to the scrubber, where the gas is washed and brought into direct contact with straw oil which absorbs the light oil in the gas. The latter then is carried to the gas-holder where it is stored. About 40 per cent of the entire amount of the gas generated is used in firing the coke ovens. The remainder will take the place of at least 1,800 barrels of oil daily during the winter months for heating the boilers of the power-houses which furnish compressed air to the mines and smelter.

The straw oil, or gas oil, which is a by-product of an oil refinery, takes from the gas the benzol and its homologues and the straw oil, when it has absorbed the light oil, becomes what is known as benzolized oil. It then is sent to a Still where it is thoroughly distilled and by the application of heat becomes benzol. The wash oil, when it collects in the Still, is sent to a cooler through a maze of pipes and is re-used in the scrubber. After the benzol has been driven off the temperature in the Still is increased and toluol is driven off. After this the temperature is again increased and solvent naphtha is driven off. By a process of re-distilling these products are made pure and marketable.

Coke Plant at Anyox, B. C. Smelter is seen in the distance.

The dimensions of the ovens are as follows:

At one end 18 inches wide, with a spread of three inches added to the other end in order that the big electric ram which pushes the coke from the oven will go clear; they are nine feet high inside measurement and forty feet long. With slight reduction that is the size of each cake or slab of coke as it leaves the oven.

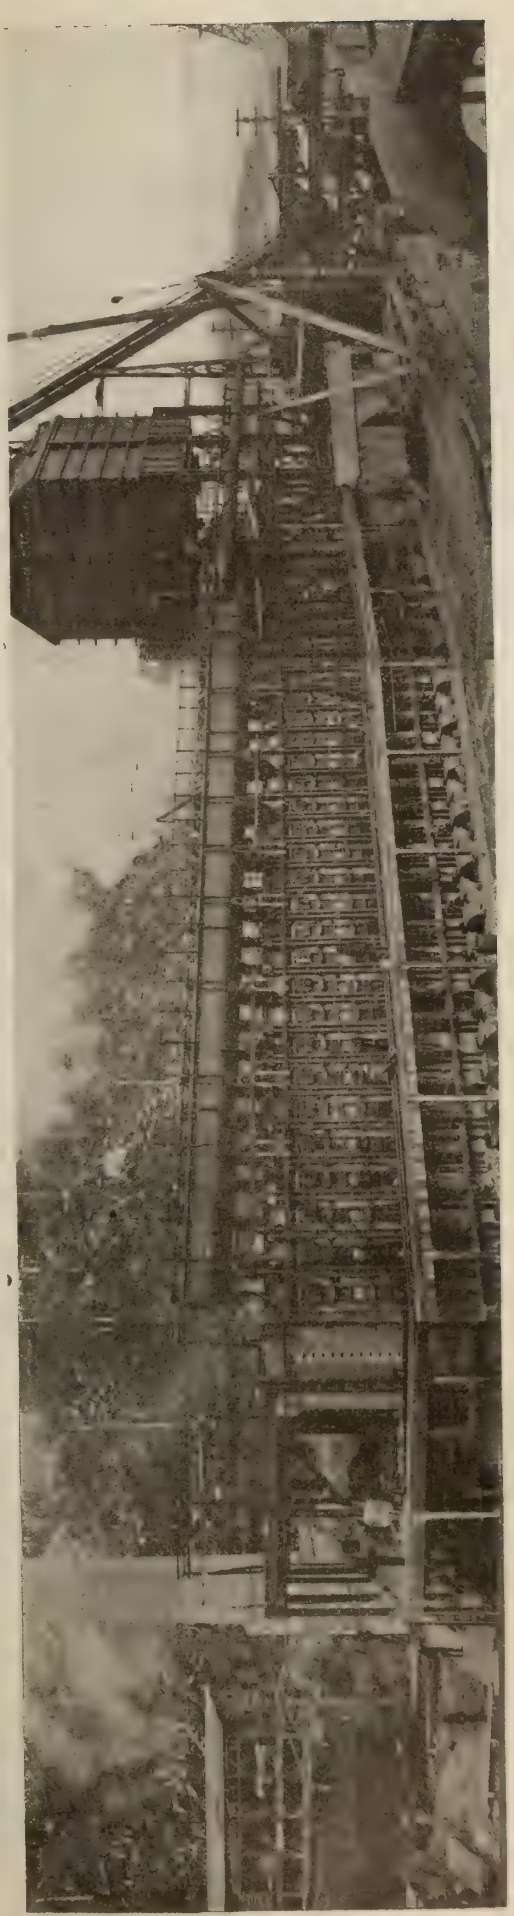
Charging of the ovens is done by the larry which is fed from the elevator at one end of the ovens where the pulverized coal has been transferred from the bunkers over an endless belt. This larry runs upon an electrified track, stopping over the hatches of each oven long enough to perform the mission of recharging. As the coal is carbonized to the finished state the oven doors are automatically removed from both sides of the ovens and an electric ram pushes the red hot cake of coke through the ovens and dumps it into a steel electrically propelled tramcar. It is then run into the quenching station, where water automatically flows upon it sending off great clouds of steam and shattering the coke by impact. It is then transported over the same line to coke bins conveniently placed where it is loaded into cars and makes its way to the smelter Each oven holds 13½ tons of raw coal which when carbonized leaves its residue of coke, 65% of the whole. The greater part of the balance has gone into by-products and gas. Carbonization in each one of the thirty ovens is effected in eighteen hours.

The by-product oven offers a complete solution of the fuel problem, the plant at Anyox having a capacity of 500 tons of coke daily. The raw coal passing through its transformation process is resolved into elements of solid and gaseous fuel, its impurities are removed and made into articles of commercial value, with a total loss of efficiency in the conversion that is already less than that of any gasifying process known.

Visualize the fleets of gasoline boats that may be supplied by the benzol alone that goes to waste in the ordinary process of raw coal consumption. It is a colorless liquid possessing great inflammability and mixed with gasoline takes up the burden of motive power at a cheap account. It is used in the manufacture of paints and as a solvent for rubber. It is used in explosives and in the preparation of perfume. Such are a few of its uses while its homologue ammonia, transformed into ammonium sulphate, furnishes a fertilizer market practically unlimited, particularly at this time as Chilean nitrate is becoming scarcer each year owing to the depletion of the mines.

From each single ton of raw coal out of the 13½ that are carbonized every eighteen hours in the ovens of the Granby plant, there results 65% of the total weight in coke and 11,500 cubic feet in gas, ten gallons of tar, 21 pounds of sulphate of ammonia, 3 gallons of light oil, 1.55 gallons of benzol, .40 gallons pure toluol, 30 gallons solvent naphthalene and 4 pounds crude naphthalene.

From the tar the by-products are so numerous as to be staggering in their possibilities. Creosote is extensively used in all seaport cities where docks and wharves are built as a preventative against the inroads of the teredo, while the application of pitch is too well known to need comment. An immensce tank of steel has been constructed at the Anyox plant to take care of the coal tar which runs in a steady stream from the coke ovens.



Coke side, Coke Ovens at Anyox, B. C., showing quenching car at left, and pusher at right.

While the establishment of this fine plant at Anyox is an outstanding accomplishment, the Company also is to be congratulated upon the splendid coal mining centre opened up at Cassidy, Vancouver Island. Cassidy is regarded as a model, having no duplicate on the North American continent. Its coal mine is believed to be the best equipped in the entire world, while the comforts provided for employees are far ahead of anything known in Canada. The townsite is laid out with wide streets, the whole design being most artistic. Native trees designate the names of the streets, such as Hemlock Street, Cedar Street, Fir Street and so on through the native arboreal nomenclature. The product of the entire nursery was purchased to make the town and streets attractive, while borders of flowers lend a piquant charm. Electrically lighted at night the streets give the appearance of a city of pretentions. Mr. F. M. Sylvester, Managing Director of the Company, is largely responsible, and the comments of those who visit Cassidy and the appreciation of those who live there strikingly indicate his success.

For the married employees there are cottages of the bungalow type on ample ground space no less than fifty by a hundred feet. The houses are of the most modern build and are provided with the most modern sanitary equipment. They have hot and cold water, electric light and sewage systems. One portion of the townsite has been laid out for sports. Here will be found baseball grounds, tennis, cricket, football, lacrosse. A running track also has been laid out. Its location is one that is admirable. From a height of land surrounding it forms a perfect amphitheatre. A gymnasium is being provided and everything necessary to physical culture is being adopted.

Cassidy Colliery, Vancouver Island.

A model is again encountered in the rooming houses for the single men, while the mess house bears out the same idea and thought of cleanliness and comfort. The mess house can be compared only to a first class hotel. Trailing vines and rosebushes lead the way to the entrances. A wash and change house is provided. Waitresses are in attendance upon the tables and the selection of food is made from a well-balanced and splendidly wholesome bill of fare. Tables are not of the old style where hundreds of men sat in rows and scrambled for food. Each table seats six men and each one of the six at every table in this dining room, where 200 men can be accommodated, is given "service". The kitchen is another model. It is as nearly electrically operated as is possible.

Hidden Creek Mine of the Granby Consolidated Mining Company. 150 ft. tunnel.

In the rooming houses the best that money can buy has been provided for comfort. In fact the room may be placed on plain with those found in the homes of the well-to-do. Up-to-date furniture is there, hot and cold water, steam heat. Each room in the two stories opens upon a verandah or balcony where flowers are growing. Every room is an outside room. The Company furnished the bed clothes and blanket. There is not an item overlooked to make these rooms sanitary and comfortable. Should a miner emerge from the mines with wet clothes there is an attendant to see to it that he gets clean and dry clothes to replace his soiled ones. Shower baths, hot and cold, form part of the scheme for cleanliness and health. The smallest detail along the lines indicated, besides the actual coal mine operations, receive the attention of R. R. Wilson the Superintendent.

The coal from Cassidy, that is supplied to the Coke plant at Anyox is mined from a slope following the dip of the seam at an angle of about eighteen degrees. This slope is open to a depth of about 2.000 feet. A manway has been provided as a safety-first measure and the men are not permitted to enter the mine by the working slope. The operations are pillar and stall. The mine is splendidly timbered. Every precaution known is taken against explosion and indeed against every form of accident. The men are provided with electric mine lanps and a sirocco fan, with a capacity of 150,000 cubic ft. of air a minute, is the mainspring of the ventilation system. An accident at the mine cannot affect the fan, the fan house being situated so that it cannot be interfered with. The fan house is built of concrete. Mechanical stokers feed the coal to the boiler furnaces from the sludge of the washery period. Exhaust steam is used for heating and its return is made from the pipes to the condensers and used over again. There is not a particle of waste coal. Even the refuse from the washery is flumed to a dump where it may be taken care of, it being thought that some day a use may be found for it. Utilization of every resource in the Cassidy coal plant is the theory upon which its designers have worked. Screens provide four grades of coal. Anyox get the small coal and varying grades are placed on the market. With Anyox extracting every available by-product from coal taken from Vancouver Island for coke production the way has been pointed to a most desirable revolution in coal mining methods in British Columbia.

The Hidden Creek Mine Camp.

Grizzley Screen With Adjustable Openings

John S. WATTS, New Glasgow, N. S.

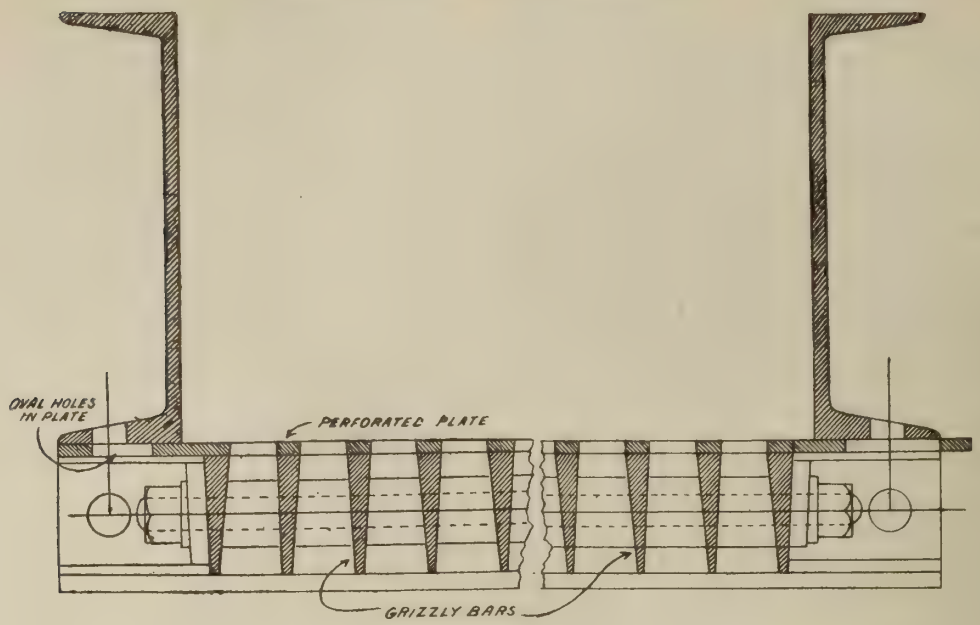

Fig. 1.

The accompanying sketch Fig. 1 shows the section of a grizzley screen, the openings in which can be adjusted to suit the working conditions. In screening out the fines from rock coming from a quarry it has been found that the width of opening, in the screen, which would be correct during dry weather, would be too fine to be efficient during wet weather and vice versa. The design shown will overcome this.

The distance pieces or spaces between the grizzley bars are made the width necessary to give the desired maximum opening, and the perforated plate is punched to suit as shown in the sketch, but with oval holes to take the bolts at the side, these holes being large enough to allow the perforated plate to slide an amount equal to the difference between the maximum and minimum openings.

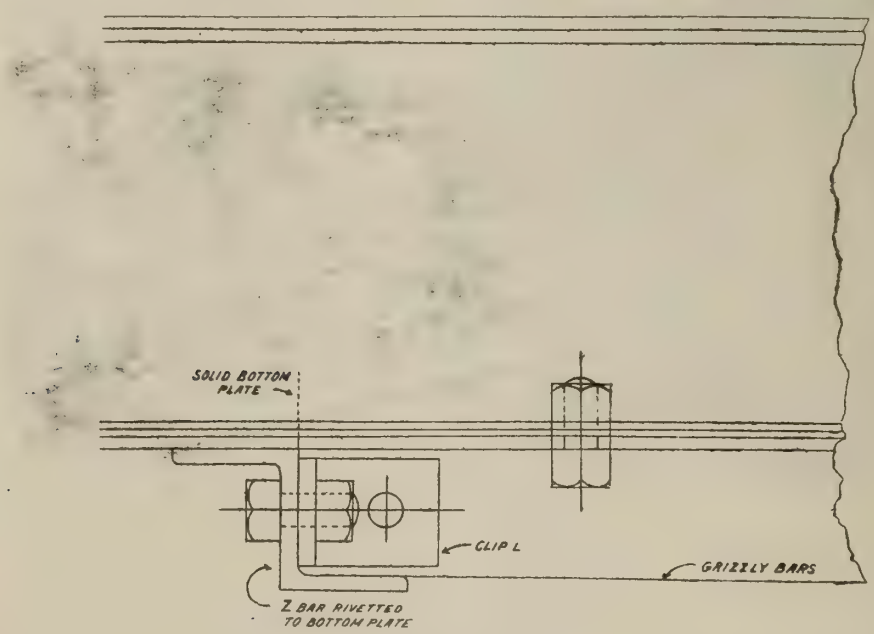

Fig. 2.

As shown in the drawing the plate is set for the maximum opening, when a smaller opening is required, the bolts at the sides are slackened, and the perforated plate slid over until the opening is closed to the desired amount.

As the screen will usually be run with the opening partly closed, it does not tend to get plugged up, and is easily cleared by simply sliding the plate to the full opening when any obstructions will fall out.

The method of construction is plainly shown in the drawing, see Fig. 2. The grizzley bars are held together by thro bolts and spacers, and rest at each end on 2 bars rivetted to the bottom plate of the chute.

CANADIAN COAL MEN.

Mr. Tonge was educated at Bolton High School, Bolton Institute, and Victoria University, Manchester, England. At the university he won numerous distinctions, including first-class honours and the Queen's Medal in coal mining. This led to his appointment as lecturer in mining in several townships under the Lancashire County Council. He subsequently became agent and general manager of the Hulton Collieries in Bolton; and it may be recorded that under his super vision the output of these collieries was trebled. Later he engaged in a general consulting practice, and was the first to introduce, in Lancashire, if not in England, the use of large stream turbo-generators in collieries and to apply electricity to the general operation of running them. Doubtless, in recognition of his special knowledge in this field he was appointed by the Lancashire Coal Owners' Association, the Manchester Geological and Mining Society, and the Lancashire Colliery Managers' Association to be the sole representative to give evidence before the Royal Commission on Electricity in Mines. In 1910 he was elected President of the Manchester Geological and Mining Society in succession to Sir W. E. Garforth.

MR. ALFRED J. TONGE,
General Superintendent Dominion Coal Company.

In 1912 Mr. Tonge accepted the position of Mining Engineer to the Dominion Coal Company, and removed to Canada in July of that year. In 1917 he became General Superintendent of Mines, and last year was appointed General Superintendent of the Coal Company. He joined the Institute as a member in 1913, and at the annual meeting this year was elected a Councillor for 1919-1920. He is also 1st Vice-President of the Mining Society of Nova Scotia.

There are just two courses open to Canada. She can shape her fiscal policies so as to encourage the development of her coal and iron resources, thereby assuring herself of a modicum of political independence, and some powers of military resistance, or she can resign herself to depending on the United States for coal and iron, or in other words, can place our country unreservedly at the mercy of our neighbors. This is the issue.—Canadian Mining Journal, issue 16th April, 1919.

So far as Canada is concerned the very title "Fuel Controller" expresses a misconception, unless indeed the Government had more in mind the importation of coal from the United States than the encouragement of production at home. What we need in Canada is not a fuel "Controller," but a fuel "Booster." The coal industry does not require controlling, or restricting, in any way. It needs to be encouraged, to be enlarged and amplified to the utmost extreme.—Canadian Mining Journal, 1st Sept., 1918.

GRANBY CONSOLIDATED MINING CO.

Report for 12 months ending 30 June, 1919.

Operating at a loss of $219,839 and showing a deficit of $984,409 after dividends, Granby Consolidated Mining, Smelting and Power Co., experienced a most unsatisfactory year in the 12 months ended June 30 last. The slowness with which copper moved after the armistice in November, 1918, and the construction of the new coking and by-products plant necessitated the raising of bank loans to $5,035,243.

It cost the company 23 cents a pound to produce its copper last year while the average price received for copper actually sold was but 17,714 cents a pound.

The company sold but little more copper during the past fiscal year than it carried forward into the present 12 months as here remained on June 30 last, 12,001,573 pounds unsold which had been shipped at an average price of 16.23 cents a pound. Sales during the past year amounted to 16,333,137 pounds at an average price of 17,714 cents a pound.

Granby sold 395,915 ounces of silver at $1.0143 an ounce and carried into the new year 172,093 ounces which was inventoried at $1. Of the gold yield the company sold 13,657 ounces and had 9732 ounces at the year end, both sales and inventory being at $20 an ounce.

Including a relatively small amount of purchased material the Granby smelters treated 1,007,862 tons of ore from which there was recovered 28,334,710 pounds of copper, 568,008 ounces of silver and 23,389 ounces of gold. Hidden Creek mines contributed 21,012,301 pounds while the Phoenix mines, now closed, furnished 6.108,314 pounds.

The average yield of all the company's mines was 27.97 pounds of copper per ton of ore. The highest average recovered was from ore at the IT mine which yielded 97.33 pounds per ton for a production of 151,829 pounds of copper. The Midas mine showed an average yield of 46.08 pounds and a production of 343,645 pounds. The average of the Phoenix mine was 19.51 pounds and the Hidden Creek mine 31.6 pounds

Granby's balance sheet as of June 30 last shows current assets of $5,692,087 against current liabilities of $6,108,744. Under the latter heading were bank loans of $5,035,243; accounts payable of $518.413 and accrued charges of $555,089. Current assets included cash of $83,774; accounts receivable 253,304; copper, gold and silver on hand, $1,963,264; metals in process and ore $1,020,279; material and merchandise $2,371,466; and total inventory of $5,355,008 assigned June 30 and subsequently securing bank loans.

Development work during the past fiscal year added 1,321,250 tons to Granby's reserves against which there was extracted 664,847 tons. This applied to the Hidden Creek mine which now has 11,500,850 tons of ore. The old Phoenix property, shut down at the present time, has 2,513,636 tons of ore of average grade of which the management believes one half remains available. The average grade of ore mined at Hidden Creek during the year was 1.88 per cent copper against 2.14 per cent in the previous year and 2.08 per cent two years ago. The mining cost at this property last year was $1,389 a ton against $1,207 a ton in the previous 12 months.

NEW YUKON BULWARK.

News of the pronounced success of the cold water thawing process in the treatment of frozen alluvial placers is among the best that ever was announced in the Klondike. It is given on authority that the thawing by that process beyond question is more satisfactory than the old steam system of thawing. and that the ground not only is better adapted to dredging but that the costs of thawing will be less than half. This means the bringing into the workable range of hundreds of miles of creeks near Dawson which heretofore were considered of questionable value. This will be the case in particular when normal prices of outside supplies are restored, and for the present the saving on thawing will act as an offset to the high costs, thus making it possible for the large companies to continue their work in this camp.

By reason of high prices, gold having a fixed standard of value, purchases today only half what it did in pre-war or normal times. Hence there was urgent need of some discovery for working frozen placers at lower cost if the works are to continue during the tiding over period. In face of the fact the gold brings relatively little in the market now, tha is, that it takes so much of it to buy the necessary food and equipment for the operations, the gold mining operator cannot afford to advance wages on low grade propositions. It is inevitable he shut down when it comes to working low grade properties unless the newer and less expensive method of work be introduced or unless the government bonus the gold miner.

Not all gold operations, however, are in such places that the gold water thawing can be applied, and the government bonus also will be a pillar under the industry. Other mineral yields have been stimulated by that process. Why not gold? At the same time a vast area of the gold gravels of this region are of the kind where cold water thawing is adaptable, and the new process therefore may be counted another pillar under Klondike both for the present and for the future. Not only Klondike, but the entire vast frozen empire of the North from Bering sea to the Rockies, and possibly in future fields beyond will benefit from the process. Siberia will come in for its share of the good. It seems the whole top of the earth—the frozen era—will throb anew with gold industries from this new process, and first among the beneficiaries will be Klondike.—Dawson Weekly News.

How long will Canadians be content to follow the American cart around, picking up what coal drops on the road? How long will the nightmare of frozen impotence oppress and depress our people? The waste of our neglected coalfields never proclaimed Canada's immaturity and shame so strikingly as today, when a huge burden of national debt is lodged on the country's shoulders, and demands for our future welfare the use of every natural bounty available for development.—Montreal "Star," Nov., 1919.

From the national point of view, the increased revenues of the Customs Department in import duties is scarcely sufficient to offset the foolishness of spending millions on the purchase of United States coal, while simultaneously the Canadian coal production is steadily dropping. The effect on our national finances is tantamount to raising a loan in the United States at high rates of interest, and it adversely affects both our money exchanges with New York, and our national earning power, to say nothing of the larger question of dependence upon our neighbours for such an essential weapon of warfare as coal.

THE ADVANCE IN SILVER.

Explanation of Rise in Price to be Found Chiefly in Far East.

New York.—For an explanation of rise in the price of silver to above gold parity of silver dollars, one must look chiefly to the Far East. It is principally demanded from that quarter, first from India and latterly from China, which has driven the price to a level not witnessed in almost five decades.

Not many months after outbreak of the war, a scarcity of silver rupees appeared in India. With the placing of orders for Indian products by the Allied nations, the interior trade of the country commenced to expand on an enormous scale, and the requirements of the media of payment increased correspondingly. At the same time the political disaffection in India, which was more or less instigated by German agents, resulted in the public showing a decided preference for silver rupees as against paper currency, which is redeemable in silver coins.

In order to supply itself with silver and meet increased demand for the coins, the Indian government first turned to China. In 1915, Shanghai had a superabundant supply of the metal. Stocks amounted then to 96,000,000 ounces, which was an abnormally high figure. But in the course of the next few years, drafts made by India reduced supplies until they stood at the exceedingly low figure of 20,000,000 ounces in the early part of 1918.

It was now impossible for India to secure any further amounts of the white metal from China. But need of it was more pressing than ever, inasmuch as the native population had made a veritable run on the treasury, presenting notes for redemption in silver rupees. At this critical juncture, the Indian government through Great Britain appealed to the United States which had the only available stock of silver in the world, consisting of about $568,209,000 silver dollars. Responding to this appeal, the United States Congress enacted in April of 1918 the Pittman act, which empowered the secretary of the treasury to melt down and ship to India a maximum of 350,000 silver dollars.

So acute was the crisis at the time in India that silver was shipped by the United States government even before the Pittman law was passed. It has been stated that had the shipments been delayed a few weeks, the Indian currency reserve would have been exhausted and the Indian government would have been forced to suspend payment on its currency notes.

A total of 260,000,000 silver dollars were reduced to bullion and sent to India. It is understood the Indian government paid $1.101½ an ounce for the metal.

In the meantime, in order to conserve whatever stocks of silver were in the market, here and in Canada, the United States and Canadian Governments promulgated an embargo on all private exports of the metal. Ban continued until the middle of the present year, and with its removal the United States Government discontinued making any further shipments to India.

Since cessation of silver exports from this country to India, the Indian government has remained out of the market for silver. It has instead been fortifying its currency reserve with gold, which it has secured in this country and in London. Virtually all offerings of Transvaal gold made in London are now finding their way to India.

By the time demand of silver from there ceased, world shipping conditions had improved to such an extent that China was able to roll up a tremendous favorable balance has been chiefly met with shipments of the white metal from the United States, and the Chinese bank reserves, which were depleted by the Indian drain, have been thus replenished. In spite of the recent sharp advance in price for silver, Far Eastern exchanges continue to rule above the silver export parity. Thus China is still in a position to take silver from this country.—Boston News Bureau.

WORLD'S COAL PRODUCTION.

In the last year before the war the world's total output of coal approached a billion and a half tons, being 1,478,000,000 tons in round figures. The outbreak of hostilities caused a tremendous drop in production which had reached its lowest point in 1915, when production declined to 1,312,000,000 tons. Thereafter as the warring powers realized that the struggle was one of munitions quite as much as of men the world's production was greatly increased. During the last two years of the war it reached a level approximately that of 1913, being 1,473,000,000 tons in 1917 and 1,468,000,000 tons in 1918, as nearly as can be estimated, as exact figures cannot be obtained for Central and Eastern Europe during the war period.

All of the great coal fields of Europe lay within the belligerent countries, and in all of them production declined. Even those districts that were fortunate enough to escape devastation suffered from lack of man power and transport. Deprived of their normal imports from England and Germany, the neutrals and Itly endeavored to increase the output from their scant resources. The stimulus to production supplied by the scarcity in Europe was felt even in Africa, the South Seas, and the Orient.

Upon the United States, however, fell the chief burden of making up the deficit caused by the war. In 1913 the country was contributing 38.5 per cent of the world supply. During the war its share increased at the rate of about 2 per cent per year, until in 1918 approximately 46 per cent of the world's output of coal came from the United States.

PERSONALS.

Dr. J. Mackitosh Bell is at Almonte, Ontario. He is to give a series of 10 lectures, each dealing with a prominent mining area in Eastern Canada, Australasia and Siberia, at Harvard University in January. He will make his headquarters in Toronto.

Mr. C. E. Smith has been elected chairman of the Toronto branch of the Canadian Mining Institute.

Mr. J. C. Murray is at Port Arthur, being interested in development of properties in that district.

Mr. D. H. McDougall, President of the Canadian Mining Institute, is expected to sail from England for Canada about the 25th November.

Our readers will know that this journal urged for over a decade serious consideration of the dangers that lie in our utter dependence on the United States for a coal supply. We have submitted the proposition that economic dependence sooner or later must bring political subservience, and we can see no escape from the implications of this proposition.—Canadian Mining Journal, issue of 16th July, 1919.

Special Correspondence

BRITISH COLUMBIA.

Barkerville, B.C.

The district of which the historic town of Barkerville is the centre, well known to all old-time Cariboo prospectors, is described as being all agog with pleasurable anticipation of the permanent rehabilitation of the mining industry next year.

This activity is attributed to the quartz claims situated on Proserpine Mountain, about four miles to the north of the town, having been acquired by the Mining Corporation of Canada, headquarters Toronto, Ont., and the plans the latter have decided on, and already have commenced carrying out, for their development.

Under the direction of Robert H. Bryce, late of Cobalt and Porcupine, a crew of more than fifty men is now at work. Cabins have been built providing sleeping and eating accommodations for one hundred men, together with offices and other necessary buildings. John Bell, an old-timer in the district, has taken a contract for the driving of two tunnels of 200 feet each, while I. E. Moore has a contract for a third and a fourth is to be constructed. Two diamond drills are being shipped to the property and will be at work before long.

In short the lode is to be as thoroughly explored as possible before spring, between $70,000 and $100,000 being spent in test work alone. If the results are satisfactory, indicating that the values continue at depth, the town of Barkerville will be made and the district generally will benefit materially. That such will be the outcome appears to be the confident opinion of the company, prospectors, and all residents. The surface showing is good; the outcrops show a depth of at least 800 feet from the summit, and at that depth the width of the ledges holds uniform, one being 17 and the other 42 feet. The average assays hold all along this depth, the values to the ton being, roughly speaking, $17.

J. D. Galloway, Government Mining Engineer, who returned recently from the district, refers enthusiastically to the outlook. After speaking of the proposed work of the Mining Corporation of Canada, he says that open cuts, shafts and tunnels are being dug into the hill with the object of proving before spring whether the property is a big low-grade gold property or nothing at all. All indications are most favorable, he says, that the results will be good. He states that, as a result of this company's activity, there has been a small-sized stampede into the Barkerville section, that claims have been staked all over the country, and considerable prospecting has been done. "There is good reason to suppose," he concludes, "that other properties will be discovered as a result of this work and that Barkerville will again come to the front as a gold mining camp."

Kamloops, B.C.

The difficulty of obtaining labor is hampering the completion of a number of British Columbia enterprises which are expected to benefit the mining industry. One of these is the branch line of the Canadian National Railways between Kamloops and Kelowna by way of Grande Prairie and Vernon. Another is the branch railroad from the Kettle Valley Railway to Copper Mountain, where the Canada Copper Company is opening up, on a large scale, extensive deposits of low grade copper. A third is the construction by the Kootenay Power & Light Company of its power line from Bonnington Falls, where the power is developed, to Princeton, where it is to be used by the Canada Copper Company in its new mill. The new Kamloops—Kelowna Branch Road will afford transportation facilities necessary to the development of the gypsum deposits at Grande Prairie, which are owned by the Manitoba Gypsum Company and said to be of enormous extent.

Nelson, B.C.

John R. Cassin, president of the California Mining Company, states that the process by which the ore of the California Mine, situated near Nelson, B.C., is to be treated has been decided and that the necessary new machinery is to be ordered. Experimentation with the gold-silver ore of this property, carried on at the Athabasca Mill, provided the basis on which the process was determined. At present the mill, which was built to treat Athabasca Mine ore, is purely a stamp mill. To the ten stamps will be added a ball mill which will be used for primary grinding and which will operate in a close circuit with the classifier The product will pass over the Senn amalgamating tables and finally will be treated by oil flotation. The experiments indicate that 90 per cent of the values may be recovered by the treatment outlined. No extension of the mill building will be required. The capacity of 25 to 30 tons may be increased by putting in additional grinders and tables, as the output may necessitate.

Some indignation is expressed in British Columbia mining circles because of the reports that Great Britain has been an inquirer in the United States for large quantities of zinc when difficulty is being experienced in the moving of Canadian zinc for want of a market. F. A. Starkey, commissioner of the Associated Boards of Trade for Eastern British Columbia has taken the matter up with Sir Robert Borden, Premier of Canada as follows:

"Sir: The reason for submitting you a copy of the enclosed resolution passed at the annual convention of the Associated Boards of Trade of Eastern British Columbia is for the purpose of impressing upon you the serious need for consideration of the request made therein, which is that a preference be given to the Dominions and Colonies by the Government of Great Britain in-so-far as the purchasing of raw and manufactured material is concerned.

Attached thereto you will note a clipping from the Engineering and Mining Journal, New York, which is an acknowledge authority on the metal markets. It will be seen that Great Britain, France and Belgium are all making inquiries for both lead and zinc metals. It is also shown that it is not the first purchase in quantities Great Britain has made in the United States market.

Therefore, we are most desirous to have your Government impress upon the Government of Great Britain the importance and imperative need of a preference being given to the Dominions and the Colonies in purchasing our raw and manufactured goods which, if consummated would be the means of bringing about a more favorable balance of trade in Canada's favor, thereby increasing the volume of trade within the Empire.

Hoping for your attention and personal consideration."

The resolution referred to requested the Prime Minister, then a delegate to the Peace Conference, to "place before the British Government the strong advisability of the British Dominions and Colonies being given a preference in the purchase of supplies for the reconstruction of devastated Europe; and for making good stocks of raw and manufactured material which have been depleted as a result of the war."

Thirty-five owners of mining properties, some of which are under development and some staked preparatory to similar work, are petitioning the Government to assist in the construction of a road to facilitate transportation. If the Government builds the road wanted, a further distance of 10 miles from what is known as the Edgewood-Pre-emption road, to Deep Creek on the Vernon Highway, it will bring the road within twelve miles of the camp and materially cut down ore shipping charges. The Killarney, Waterloo, and Rampolla Groups of mineral claims are reported to be showing up very satisfactorily and operators are looking forward to splendid results next season.

Vancouver, B.C.

With the depreciation in the purchasing power of gold the system of taxation of gold mines of the Province has become obsolete and unfair in the judgment of some members of the British Columbia Chamber of Mines. If the gold mining industry is to be maintained, they hold, the fundamental principle in fixing taxes must be the ability of the properties assessed to pay. Owing to the fact that, since taxes last were adjusted, mining costs had practically doubled. A joint committee, representing the B.C. Chamber of Mines, the Canadian Mining Institute, and the mine owners, has been appointed to investigate the matter and submit a report with a view to making whatever representations are thought advisable to the Provincial Government before the next session of the Legislature.

Golden, B.C.

The Tarheel Copper Mines, Golden Mining Division, are reported to have passed out of the control of J. C. Lincke, a majority interest having been secured by Calgary business men. A company has been formed and it is proposed proceeding with development. A contract will be let for the driving of a 100 foot cross-cut tunnel to tap the ore body. Transportation facilities are to be improved to the end that the ore may be hauled direct and by a shorter route to the Kootenay Central Railroad at Parson Station. The Provincial Government is constructing a road from Parson to open up the Spillimachene River Section which, it is asserted, will be the natural outlet for the mineral of that district.

Victoria, B.C.

With the announcement from Ottawa that the Governor-General-in-Council had ordered that no coal could be exported from Canada except under license issued on the recommendation of the Canadian Trade Commission, not a little consternation was manifested by the coal operators of British Columbia. The Collieries of Vancouver Island had been producing to capacity and taking care of both the domestic trade as well as the exceptional demand of the Sate of Washington, the latter undoubtedly created through the recent labor troubles on the American side. That is to say they had been providing ample for the home requirements and disposing of the surplus in Washington.

Consequently the news of Ottawa's action came as a disagreeable surprise. They argued that, as long as no one in British Columbia suffered, the Island Collieries should be permitted to export. Hon. Wm. Sloan, Minister of Mines, who has been keeping an eye on the situation ever since the American strike, and who had been assured by the operators that nothing would be done to create a local fuel shortage, was approached to intervene with the Dominion Government. He promptly took this step and was advised that the export of coal, under such conditions as obtain in the Pacific Northwest, would not be interfered with. At any rate that was the construction generally placed upon the word which came from the Capital and, as a result, the collieries of Vancouver Island are not up to date affected, nor is their trade; it being possible to secure all the licenses required.

In a statement Mr. Sloan pointed out that during the year 1918 sales of British Columbia coal for consumption in Canada amounted to 1,010,938 tons, while 752,821 tons were sold for export to the United States and 58,417 tons were sold for export to other countries. It, therefore, was apparent that the Collieries of the Province were dependent to a very large extent on their export trade and it would be dangerous to interfere with it.

Some alarm was created shortly after the Ottawa order came to hand by a report that the management of one of the principal collieries had stated that, if the regulation were enforced, it would be necessary to close down the mine. This, however, was flouted by Mr. G. W. Bowen, general manager of the Canadian Western Fuel Company, who described it as nonsence.

The Canadian Western Fuel Company has announced that the price of its coal in British Columbia will be raised $1.00 a ton, the same to take effect immediately. It was explained that this advance was made on October 1 on all coal exported to Seattle and other points in the United States. The increase in the local price was deferred, it is stated by the operators, because it was believed that local conditions might so alter as to make it unnecessary. While the Western Fuel Company is the only Company to make the advance thus far it is considered likely that others will follow suit.

This change in price brings local standard lump coal to $12.50 a ton. The Seattle price to the consumer for the same coal runs between $14 and $15, according to the district in which it is delivered.

Reasons given for the increase are that the Canadian Western Fuel Company, in the exploitation of the Nanaimo Mines, finds that the percentage of lump coal has dropped from eighty to forty-eight per cent of the output; that there is little demand for the smaller grades although it costs more to handle; and that extension of the underground workings and the decline of some of the best seams, has resulted in longer and, of course, more expensive haulage, which has brought down the production per man per day from three and four tons to one and one-half tons.

It is stated that the greater quantity of the lower grades of coal are shipped to Washington, the greater percentage of British Columbia consumers insisting on having the lump coal.

Prince Rupert, B.C.

All fear of a coal famine this winter at Prince Rupert has been dispelled by the assurance that the city's requirements can be adequately cared for by the mines at Telkwa, a short distance inland on the line of the Grand Trunk Pacific Ry.

Dawson, Y.T.

The Yukon Gold Company has paid $2,500 to each of the four widows of its employees who died of poisoning after eating a meal at the Hunker Boarding House. It was not clear whether the case came under the Workmen's Compensation Act, so the company offered the settlement indicated, which was accepted. The widow of another man, not an employee of the company, but who partook of the fatal meal, was given $1,000. In all 12 men died, eight having no dependents, and several others were taken sick and were ill for some time. These latter were paid half time during their illness.

Trail, B.C.

Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Company for the week from November 1 to 7 inclusive totalled 4,233 tons, making the aggregate for the year 279,828 tons. Of the independent shippers the largest contributors were: Josie, Rossland, 249 tons; North Star, Kimberley, 376; Rambler-Cariboo, Rambler, 235; Ruth, Cedar Creek, 115; Silver Standard, Silverton, 293. The Centre Star, Rossland, was the only considerable shipper among the company's properties, its total being 2,319 tons. The strike still is in effect at Kimberley, so that the Sullivan Mine is not producing.

Lethbridge, Alberta.

Before the Alberta Coal Commission in Lethbridge it was declared by A. Bryant, representing the miners of Chinook Collieries, that much of the recent One Big Union strike trouble in District No. 18, U.M.W. of A. was caused by the agitators doing the thinking for the miners. When the strike was at its height the miners had voted to break away from the U.M.W. of A. and join the O.B.U. but later they had deserted the O.B.U. and again gone with the International. Two weeks later they had been swayed by the O.B.U. agitators and reversed their decision only to change their minds subsequently when it was thought better to retain their international affiliations. This evidence strongly substantiated the testimony of Commissioner Laughran, representing District No. 18, U. M.W. of A., who declared that much of the instability in the coal mines' industry in the Province of Alberta was caused by agitators who so easily swayed the rank and file that it made it almost impossible for the district officers to follow a straight course. Without these irresponsible spirits there would be fewer rash promises to the men and less pithead strikes.

Victoria, B.C.

Hon. T. D. Pattullo, Minister of Lands in the British Columbia Government, is in Ottawa interviewing the Dominion Government with reference, among other matters, to the construction of a branch of the Grand Trunk Pacific Railway into the Ground-Hog Coal Country. Situated at the headwaters of the Naas River in central British Columbia, the Ground-Hog is regarded as one of the richest coal areas of America. As yet it is altogether undeveloped. But there are showings, some of them of anthracite, which extend for miles across the country and the Provincial Government believes that if a railway can be secured to tap this section a great coal camp soon would be established. Such a road would have to be constructed from Hazelton, or some convenient point near that town, as the Ground-Hog is almost due north of Hazelton.

C. M. I. TORONTO BRANCH MEETING.

Minister of Mines and Attorney General Address Institute Branch Meeting.

The new Ontario Government was represented at the luncheon meeting of the Toronto branch of the Canadian Mining Institute, Saturday, November 15, by Hon. Harry Mills, Minister of Mines and Hon. W. E. Raney, Attorney-General. They were introduced by Mr. J. R. Tyrrell, chairman of the branch, who pointed out that most mining engineers intend to own a farm some day and should be regarded as potential farmers at least. He hoped therefore that the Ministers would find themselves in congenial company.

The Minister of Mines made it clear in a few words that he intends to devote his attention to development of mineral resources rather than to labor propoganda. He was chosen by the labor party as one of their representatives in the Cabinet, but he does not consider his work as Minister of Mines should be taken advantage of to further the interests of any class. He will expect the Department of Labor to deal with labor matters while he will devote his attention to the production of minerals. He said he recognized, as his constituents well recognize, that capital is necessary for the development of natural resources and he intended to do whatever he could to bring capital to the country for the mining industry. As a resident of Fort William he feels that Northern Ontario has a great future and that it has not yet received the recognition it deserves. He will endeavor to put Northwestern Ontario more prominently on the map.

The Attorney-General in a short address gave some idea of the aims of the new government and claimed that while it is a government, chosen by the farmers and labor, yet the Ministers can be counted upon to give all classes a fair deal. One of his first acts was to get rid of the political party governments, and he states that every endeavor will be made to win justice for all.

After the Ministers had spoken, Chairman Tyrrell called on Dr. W. G. Miller, a past president of the Institute and Prof. H. E. T. Haultain. Dr. Miller pointed out that development of mineral resources depended largely on the initiative of men who were ready to venture so long as they had good grounds for believing they would profit greatly if their ventures proved successful. The nickel industry in Ontario is a case in point, for the men who developed the nickel industry had a long hard struggle before they achieved success.

Professor Haultain thanked the Ministers for their plain speaking, and stated that he had never before had the pleasure of hearing Cabinet Ministers express themselves so frankly and simply. He thought that mining engineers would become more interested in politics if the people would approve of straightforward talk and action. As one of the senior members of the Mining Institute he invited the Hon. Mr. Mills to apply for admission to membership in the Institute.

The election of new officers for the branch resulted as follows: Chairman, C. E. Smith; vice-chairman, J. B. Tyrrell; secretary, J. P. MacGregor.

The Toronto branch holds meetings every two or three weeks during the winter months. Most of these are luncheon meetings on Saturdays at the Engineers' Club. There were 35 present at the meeting last Satuday. R. E. H.

Note:—A short account of this meeting appeared in the last "Journal," for the additional details given warrant a second mention of an unusual gathering.—Ed

Nova Scotia Notes

Following the explanation of the Nova Scotia coal operators that they could not grant the schedule of wages asked by U. M. W. of Nova Scotia in replacement of the existing schedule, the union has asked for a Board of Conciliation which it is announced from Ottawa will be granted. It is also understood that this Board will be asked to consider the wage question at all the collieries in Nova Scotia The composition of the Board has not yet been selected. but it is understood that Mr. J. C. Watters will probably be the nominee of the U. M. W. of Nova Scotia.

The Secretary of the United Mine Workers states that the union has not, as reported in the newspapers, agreed to the sending of coal from Nova Scotia to New England ports in proportion to the amount of United States coal supplied to Canada during the U. M. W. strike in the States. The Secretary's statement as reported in the Glace Bay "Gazette" is as follows:

"Our position is this—we refuse to let any coal be shipped into the United States while this strike is on; it is not a question of exchanging coal. The U. M. W. executive discussed this matter with Mr. Magrath at Truro, a couple of days ago. The U. M. W. will refuse to let any Canadian coal be shipped to the States."

This rather ties Mr. Magrath's hands, as there is no practicable method by which Nova Scotia coal can be delivered in the central provinces of Canada now that navigation is about closed in the St. Lawrence. It also rather effectually disposes of some of the arguments of influential persons in Ottawa who have advocated the extension of the jurisdiction of United States' labor organizations into Canada, and were particularly convinced of the benefits that Canada would experience when it came under the benign sway of U. M. W. headquarters at Indianapolis.

As a matter of practical politics, however, Ottawa will dispose of the available coal of Canadian origin to the best of its ability in order to keep Canadian citizens from freezing to death.

The Dominion Coal Company has made a number of improvements in its practice recently, which while not very important in detail, will in their combined effect tell favourably on costs and production.

Particular attention has been paid to the economy of compressed air, and pipe ranges of insufficient diameter, have been replaced by pipes of larger diameter. An investigation of the many little sources of air leaks has been undertaken, something that must be done every little while. The use of the portable air meter has proved of great advantage as a discoverer of unsuspected leaks and obstructions.

The undersea territory of some of the Phalen mines is being rapidly developed. The pillarage which must be left in the submarine tracts lessens the amount of extractable coal per acre, and necessitates a more extended and more rapid driving of the "narrow-work" than is required in the land areas. Double-shifting of the narrow work places is therefore required.

The pumping stations of the Company are also being concentrated. Larger lodgements, or gathering places for the water are being provided, and electrically-driven centrifugal pumps are being substituted for the air-driven pumps. The electric current is usually led down a borehole, and the pump discharges to the surface through a cased bore of large diameter, usually twelve inches. Special provision is being made for dealing with the submarine areas, and the main pumping stations are situated as near the shore as possible, and are designed with special reference to the possibilities of undersea mining.

An unusual amount of prospecting has been done during the past few months on the Dominion Coal Company's areas, chiefly with regard to the lower seams, Emery, Gardiner and Mullins. The approximate position of these seams is of course known, but before accurate projections can be made for future openings, the seam must be actually uncovered and exactly located.

The Glace Bay "Gazette" suggests that the Dominion Coal Company has a good opportunity, in entering the North Sydney coalfield to create a model mining community, and the advice is good. There is just one way in which the ideal community can be brought about, which is one of the exemplifications of the possibilities for good in a monopoly The Corporation that undertakes to create an entirely new mining community in an unpopulated district should be sole owner of all the adjacent property, and should itself own and control every municipal facility. The district of New Waterford is pointed to as an example of a good opportunity missed, and all who know that district will agree. The Dominion Coal Company in the first instance provided streets, lights, water and transportation, but the real estate speculator reaped the benefit, while the Company pays the major portion of the taxes.

The Sydney "Post" quotes the Glace Bay Gazette's editorial, which is unfortunately too long to be repeated in these columns, and makes the following comment thereon:

> "If the expectations of the Dominion Coal Company's experts as to the value of the Bonar Head coal for metallurgical purposes are realized, this colliery is certain to become, in the not distant future, the centre of one of the large mining towns of Cape Breton. Timely measures should therefore be adopted by the Coal Company to protect the people against the greed of real estate speculators in this district. Extortionate prices for dwelling lots and business sites are among the conspiring factors in high rents and burdensome living expenses. High rents and excessive prices for the necessaries of life are in turn responsible for much to the prevailing unrest among industrial workers. If is as much to the interest of the Dominion Coal Company as to that of its employees, to take the necessary steps to have plenty land available, at moderate prices, for residential and business purposes, within easy distance of the new mine at Bonar Head. It is often said that it is easy to be wise after the event. The Coal Company has had more than enough experience to give it wisdom in this connection."

Mr. J. P. Gordon, on whose property at Copper Lake a sensational gold discovery was made this summer, has gone to the property by dog team. It is probable that development work will be carried on vigorously next summer and the necessary supplies can most easily be assembled in the winter.

Manitoba Notes

Gold Pan.

Arrangements are being made for the resumption of development operations at the Gold Pan mine. The pumps have been in operation for some time and the mine is now dewatered. Mr. J. B. Tyrrell will visit the property shortly to complete his examination and advise the directors concerning development of the ore deposit.

Brooklyn.

Shaft sinking has been resumed at the Brooklyn. At the 100 ft. level some drifting was done and Foreman MacDonald reports that very good ore was broken, there being an abundance of five grains of gold visible in the ore. Owing to the heavy snowfalls and the lack of frost in the ground the roads have been in very bad shape and the company has had difficulty in obtaining the necessary wood for the boilers. It is expected that this difficulty will soon be overcome. At present the miners are drilling by hand. Superintendent Anderson who has been on a trip to Buffalo has returned to the mine.

Better road needed.

The operators in the Rice Lake district are not receiving the encouragement from the Manitoba Government that the pioneers in a new industry deserve. The development of the gold deposits will mean much profitable business for the people of Winnipeg, but there is no general appreciation of this fact yet. The winter road from Fort Alexander should receive some attention. The government has not even cut out the summer windfalls. Manitoba has yet to experience what the development of mineral resources means in the form of markets for supplies for companies and miners and their families. Ontario mining companies spend millions of dollars annually for supplies and their employees spend millions for food, clothing, housing and other necessaries. The Manitoba Government would do well to help build up such an industry in that province.

Flin-Flon.

While the reported sale of the great Flin-Flon ore deposit to Hagden Stone & Co. of Boston has been denied, the property will receive some attention this winter. It is planned to open up the ore body by shaft and lateral work underground. The information so far obtainable is from the results of surface examination and numerous diamond drill holes. The proposed development work will be the first mining to be done on the property. The diamond drilling showed that there is an enormous body of ore.

LIGHT RAILWAYS FOR THE NORTH.

Toronto Company formed and work of constructing narrow gauge lines to start in the Spring.—Meeting of Ontario section Mechanical Engineers. Toronto Notes.

(Staff correspondence Canadian Mining Journal)

Toronto mining interest are much interested in the formation of the Canadian Light Railway Construction Company, Limited, with an authorized capital of $500,000 for the purpose of building light narrow gauge railways in the outlying mining districts of Northern Ontario The company, which has been incorporated in Toronto, included J. Roebuck, C. J. Corless and W. B. Jones and is headed by Mr. Solo-way. It is announced that work will not be commenced until spring and that the first section built will be between Elk Lake and Gowganda, a distance of 28 miles which will take about two months to construct. A system of roads such as it is proposed to construct after the style of the light railways for rations and munitions in France and Belgium, should command considerable assistance from the Ontario Government by reason of the fact that the Government would be relieved of the burden of constructing and maintaining expensive highways. The outcome of the first section will probably decide the advisability of extending the scheme to other camps such as Boston Creek, Larder Lake, Skead Township, Munro, Fort Matachewan and West Shining Tree.

Note:—Our readers will recollect that the use of ligt railways in the mining districts of Northern Ontario was first mooted by the Journal in its editorial columns (see issue 9th July 1919.)

An extensive development scheme will be undertaken on the properties of Gold Centre Mines, Ltd. in the Porcupine district in accordance with a report by B. M. Walton, M.E. to the secretary of the Company, M. P. Van der Voort of Toronto. The engineer says, that the property is exceptionally well located, adjoining the Hollinger Consolidated Gold Mines and that the mineralized area of the claims is large and the veins strong. The property, he declares, with serious development will amply justify the expenditure of a considerable amount of money with favorable chances of developing into a producing and paying mine. The report recommends the proving of the property by diamond drilling to a depth of about 5,000 feet and adds "I am convinced that this area alone would indicate a mine of large size and immense possibilities. Should the diamond drill holes along the contact prove the existence of commercial ore bodies, it would then be reasonable to assume that the entire line of contact will extend clear across the property running northeast by southwest for a distance of over 3,000 feet in length and would mean the probable existence of a very large mine which would compare favorably with some of the largest producing and dividend paying mines in the camp."

Action has been commenced in Toronto by Frank Samuels of Philadelphia against the Black Lake Asbestos and Chrome Company, claiming $80,147 damages for alleged failure to supply 2,685 gross tons of chrome ore, which, according to plaintiff, was the undelivered balance of the ore called for in a contract The defense claims the contract was conditional on being able to produce the ore, to obtain cars to transport it and on the Government placing no restrictions on export.

The American Society of Mechanical Engineers, Ontario Section held their first meeting for the season on the evening of November 14th in Toronto. The gathering took the form of a dinner at the Engineers' Club, following which General C. H. Mitchell, C.B., M.G., D.S.O., spoke on some phases of mechanical engineering in the war, which had come under his observation in France and Italy. General Mitchell, who went over with the First Contingent in 1914 as Intelligence Officer, served with great distinction, first in France and then as Intelligence Officer on the general staff of the British expedition sent to the aid of the Italians on the Piave. His address covered transportation matters and mobile shops and other engineering features of the advanced areas in France. He

made some very interesting observations on Italian hydro-electric developments as he found them at the end of the war in comparison with their condition and size at the time of a previous trip in 1906. He gave a vivid description of the Italian engineering feats in the construction of the "Teleferrica" or wire cable-ways which transported men and munitions in hanging carriers over mountain peaks and across great chasms, even when subject to a great hazard due to shell fire.

General Mitchell, who is the new Dean of Engineering, as well as an old graduate of the Faculty of Applied Science, University of Toronto, closed with a description of after-the-war conditions at the University and drew some deductions as to the trend of engineering opportunities in different channels, as indicated by the tendency of certain branches, notably mechanical engineering and engineering chemistry, to push ahead at the present time.

After the General's address the meeting proceeded to discuss plans for the season's work and the program of one meeting per month, alternately with a dinner with an address and a technical session, was decided upon. A large number of prospective members were present and all mechanical engineers of the district are invited to participate in these meetings, with the hope that they will ultimately join. It is felt that when members come from as far away as Chatham, London and Belleville to attend, there is little excuse for local engineers failing to identify themselves with the parent organization of this branch of engineering. Notice of the next meeting will be published in a later issue of this journal.

WASAPIKA CONSOLIDATED.

The successful development of the Ribble vein on the Wasapika Gold Mines property in the Shining-tree district has naturally directed attention to the properties north and south of it, for the Ribble vein is known to cross the north boundary and outcrops of similar ore and rocks have been found on several claims to the south. Owing to the heavy soil cover the vein is not easily followed on the properties south of Wasapika, but has been uncovered for a few hundred feet on the claim immediately north. The development of this northern property is provided for in a consolidation scheme recently approved by the directors.

Under the terms of the merger the Wasapika company will acquire three valuable claims. The owners of these claims will receive one-sixth of the shares of the consolidated company while the Wasapika owners will receive one-half of the shares, and the remaining third will remain in the treasury until required for development work and plant.

In addition to acquiring property of great speculative value the Wasapika company will gain access to the water, as the northern claims border Lake Michikawakenda. There are several good buildings on one claim, providing the necessary housing for all the present employees of the Wasapika company. The northern claims fortunately escaped the disastrous forest fires of last summer and will provide all the necessary mine timber, lumber and fire wood for some years.

The directors of the Wasapika company and the owners of the three northern claims have agreed on the consolidation scheme. A meeting of shareholders will be held on Dec. 2 and it is expected that they will approve.

Development work at the Wasapika property is steadily proceeding, attention for the present being directed to the deepening of the shaft. Manager Rogers wants to obtain as soon as possible some idea of the nature of the ore deposit at 200 and 300 ft. It is probable that the 300 ft. level will be chosen for extensive lateral exploration.

The company has under consideration the building of a 150-ton mill. It is probable that construction of the necessary buildings and installation of the machinery will not be long delayed.

To the Editor of the Canadian Mining Journal,
Sir,

THE FUEL QUESTION IN EASTERN CANADA.

The Eastern Provinces of Canada, including Ontario, owe the Hon. James Domville thanks for his masterly exposition, delivered lately in the Senate of the present parlous condition of their present fuel supply.

Those who are sufficiently interested and desire to study this so important question should read the Senator's speech.

The object of this letter is to create an interest in the minds of those who consider the welfare of the industrial workers as to the possibilities of heating the houses occupied by such workers and their families with oil fuel. The advantages that would accrue from the use of such fuel are herein plainly stated. The present and probable future cost of hard coal is a very serious financial consideration to the industrial worker, who, as a rule, has to pay higher prices than the users because he is compelled to purchase in smaller quantities and has to take delivery during the months when coal sells at high prices.

Were it possible and economical to use a good grade of gas oil (one of the many grades of oil produced from crude oil by fracturation) and were such a quality of oil always obtainable, the industrial worker would be able to purchase his fuel requirements week by week, a proceeding that would result in economy and which would also be less burdensome to the family exchequer.

The economic possibilities of the use of gas oil for fuel for the heating of small houses has not, up to date, been appreciated, but now that the high cost of hard coal fuel has caused more attention to be given to the re-construction of old time ideas for small house heating (as is evidenced by the construction of the "pipless furnace"), it seems to be the ideal time to consider the use of this new fuel.

The B.T.U.s (British Thermal Units, the quantity indicating the relative heat values) contained in one pound of hard coal varies from 12,000 up to 14,000. This is for the actual coal and not for the rock too often delivered as coal. It is probable that the average quality of the hard coal delivered to the homes of the industrial workers will not average 12,000 B. T.U. But let it go at 12,000 B.T.U. It is admitted that

in a house furnace, as generally looked after and fired, the actual efficiency is very low and seldom exceeds 25 per cent.

In a publication of the U.S. Fuel Administration, it is claimed that the following losses occur:

Heat lost up the chiminey owing to improper draft regulations	40%
Heat lost through accumulation of soot	10%
Heat lost by radiation of heat when the furnace is located in the cellar	20%
Heat lost by removal of cinders and by the presence of the cinders	5%
Total loss	75%

When the heating of a small house is effected by the use of base burners, it is certain that the efficiency obtained is higher, as certain of the losses above mentioned are considerably reduced, but there are serious objections to the use of base burners with the smoke pipes passing through every room.

Be the losses what they may, it is certain that they are very heavy with the arrangements that are now in common use, and under the conditions that exist and under those conditions it is difficult to see how the losses can be lessened. But in houses that will have to be constructed in the future, more suitable conditions can be arranged for and at little and often no increased cost.

An oil fired furnaces scientifically designed should be able to secure an efficiency of over 80 per cent, but were but 50 per cent secured it would be double the efficiency of the present hot air or hot water furnace.

One pound of good quality of gas oil possesses 20,000 B.T.U's, as compared with average hard coal 12,000 B.T.U.s. At 25 per cent efficiency one pound of hard coal gives 3,000 B.T.U.s, whilst at 75 per cent efficiency gas oil gives 15,000 B.T.U.s, and at 50 per cent 10,000 B.T.U.s, so in one case one pound of oil gas will be as efficient as 5 pounds of hard coal, and in the other case as efficient as 3 1-3 pounds. To be conservative the value of 3 1-3 pounds will be taken.

The industrial classes pay from $12 to $16 per ton of 2,000 pounds for hard coal—say $14 for 2,000 pounds of 3,000 effective B.T.U.s, or $14 for 6,000,000 B.T.U.s.

A gallon of gas oil will weigh 8—6 pounds arid at 10,000 effective B.T.U.s will total 86.000 or 70 gallons will give slightly more effective B.T.U.s than will 2,000 pounds of coal.

Therefore, gas oil at 20 cents per Imperial gallon, will yield as many effective B.T.U.s as will one short ton of hard coal.

Were the oil bearing shales of the Maritime Provinces developed an extremely high quality of gas oil would be produced, and this oil could be retailed at about 15 cents per gallon, so that the eventual cost of this fuel would be at least 25 per cent less than that of hard coal, whilst the labor and cost of repairs would be immeasurably less.

The use of gas oil, as fuel, supplementing the pipeless furnace, and the pipeless furnace so perfected, would seem to solve the question of heating for houses occupied by the industrial worker.

It is time that a practical consideration of the housing question, as it affects the needs of the industrial workers, should be taken up. The work undertaken by a branch of the Commission of Conservation under Mr. Thos. Adams would appear to have resulted in farce, frills and fiasco. Engineers learn to put "garments according to the cloth available. Dreamers spirit the cloth in attempting to supply garments possessing unnecessary and too often undesirable "frills." What is wanted are comfortable and sanitary houses, without frills, built at the lowest possible first cost and liable to receive the smallest possible cost for up keep. Is it not time for the public to realize the immense account of time and money that is being wasted through the placing of Canada's housing affairs under the management of men, who understand neither the needs of the industrial workers, local construction conditions (which in a country so large as Canada must needs vary widely) nor the practical problems involved in the economical and low costing construction.

LOUIS SIMPSON.

172 O'Connor St., Ottawa.

Copies of the Senate Sheet, as long as the supply lasts, can be obtained by persons living in Eastern Canada by sending a request accompanied by a 2c stamp to pay postage.

PORT ARTHUR NOTES.

By J. J. O'CONNOR.

Twelve zinc claims in the Ozone Siding zinc area, hitherto owned by several different parties, have been consolidated under one ownership, headed by Dr. R. J. Manion, M.P., Fort William.

A new discovery of zinc has been made ten miles east of Ozone Siding. Full particulars of the new find have not reached the writer as yet. It is said to be of a most promising character. A number of claims have been staked, and the field is being thoroughly prospected.

About midway between Ozone Siding and the new zinc discovery, a ten foot vein of baryte has been uncovered, claims are being staked, and preliminary work being done on them.

Excellent shipping facilities are afforded all of the above properties, as they lie alongside the Canadian Pacific Railway, which at that point skirts the shore of Mazokama Bay, a deep water harbour, on Nepigon Bay, Lake Superior.

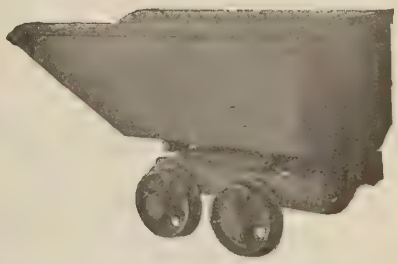
WANTED—A competent man with experience covering the principal departments of electrolytic copper refining. Must be prepared to go to Europe if necessary. State terms in application, also experience in design construction and operation, giving references. Mark envelope "Application" and address to W. J. Forrester, Imperial Bank Chambers, Leader Lane, Toronto.

Showing position when dumping at the side.

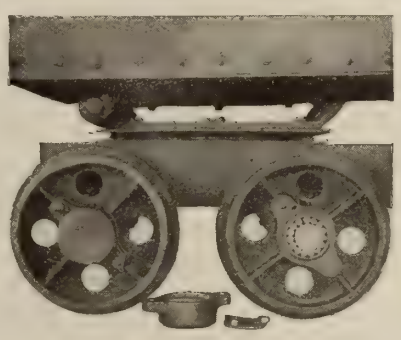
ROLLER BEARING

Rotary "Scoop" MINE CARS

Will dump at either side or either end.



Showing car closed and ready for loading.



Showing the Roller Bearings supplied in all four wheels of our Mine Cars. Note the dust-excluding cap, with ample capacity for holding grease or oily waste.

This is only one of the many types of cars we make for the use of mines. We make these Scoop Cars any size or capacity you want.

Send for your copy of our Mining Catalogue showing many other types of Mine Cars. It will repay you.

BOLINDER'S Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only ½ cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only **$1:—per hour at full load.**

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

Simple

Reliable

Durable

This Cover Reduces Costs *on Industrial Water Hose*

We never heard of industrial water hose bursting because of internal pressure. Any fairly good water hose will stand all the pressure it will ever get in industrial use.

But we have seen and heard of thousands of feet of water hose which had to be discarded long before its time because the *cover* wore through.

That fact guided Goodyear scientists in designing Goodyear Water Hose.

They started with a good inner tube and strong fabric.

But they put on this hose an unusually thick cover of exceptionally tough rubber.

Water Hose is dragged over floors and pavements and steel plates. It is walked on and run over by hand-trucks and wheelbarrows. It is left outside rain or shine. *The Goodyear cover on Goodyear Water Hose is built to stand this use.*

That is why Goodyear Water Hose wears longer and so costs less.

That is an example of the way Goodyear builds all Industrial Hose—

—finding out what conditions must be met, and then developing the materials and construction to meet them.

Goodyear has scientifically developed a hose for every industrial use. Samples of this hose, and the advice of a trained technical man, are yours for the asking—without obligation. Phone, wire or write the nearest branch.

A Graphical Summary of the Chronology and Progress of Canadian Mining

(By the Editor.)

Most essays and articles are illustrated after they are written, and pictures or diagrams are used, as the term signifies, for the purpose of throwing additional light on the subject discussed, but in the present instance, the graphs which are herewith reproduced were drawn first, and they constitute the main purpose of this article, which is, indeed, but comment suggested by the tendencies disclosed by the graphs. They are compiled from the statistics of the Division of Mineral Resources of the Mines Department at Ottawa, the value of which statistics we desire to acknowledge, together with the unfailing courtesy of its Chief, Mr. John McLeish.

Figure 1 shows the value of the mineral production of Canada over the last twenty years. The most striking disclosure of this graph is the predominance of Ontario. Quebec shows a gradual, but healthy, growth. The growing importance of Manitoba is reflected in the rise of the combined curve of the Prairie Provinces and the Yukon, but the scale is too large to show how Manitoba is making up for the falling off in the Yukon gold production. We venture to forecast that some day the value of the coal production of Alberta alone will exceed the value of the mineral production of any other single province of Canada, unless maybe it shall be British Columbia. The import of the concentration of the coal resources in the Province of Alberta is not by any means realized by the Canadian public. The combined curve of the Maritime Provinces is not, we believe likely to increase greatly, first, and chiefly of course, because of the comparative territorial smallness of these provinces, and, secondly, because the bulk of the value of their mineral production is derived from coal; and, in our

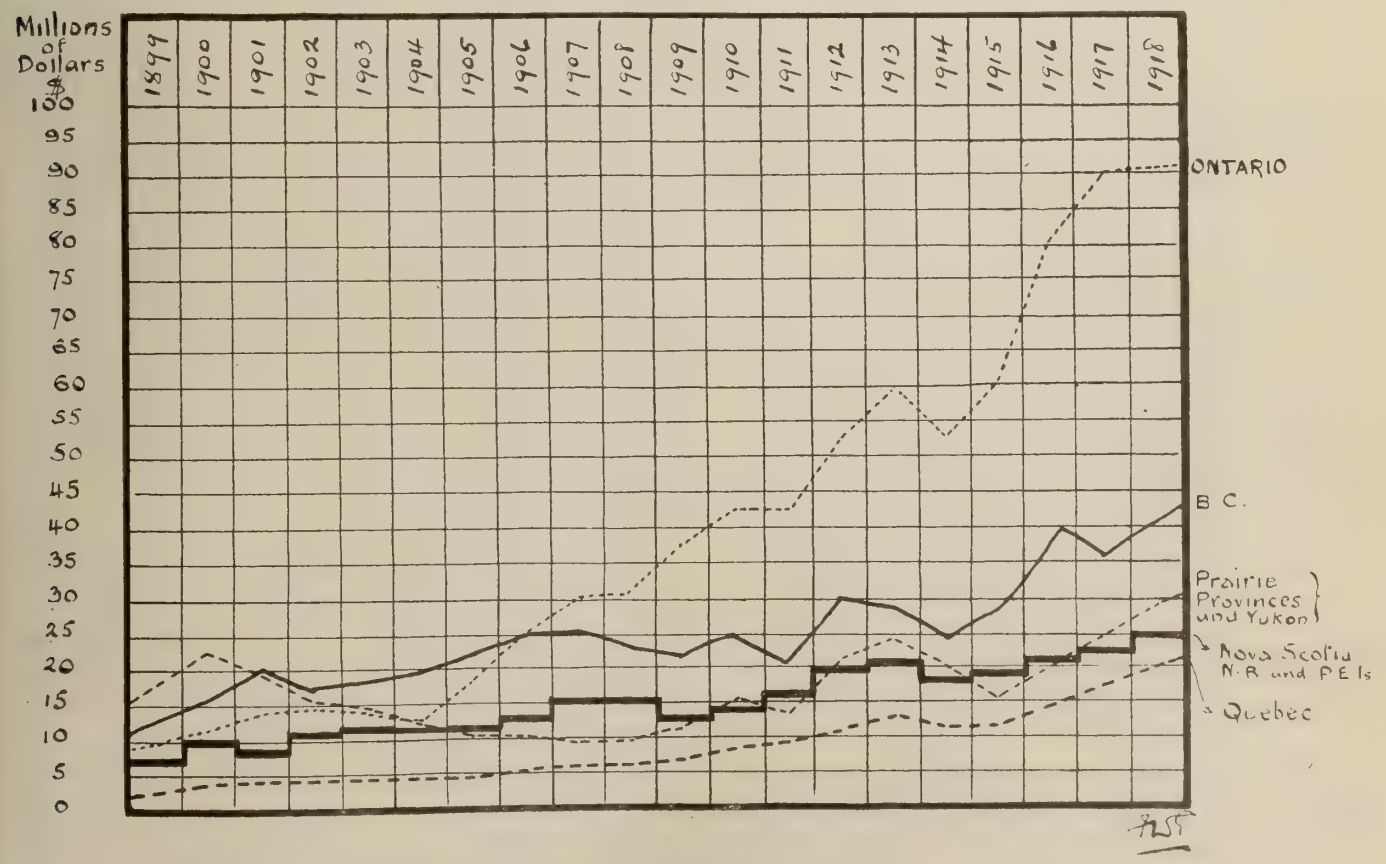

Fig. 1
Value of the Mineral Production of Canada over 20 years, by Provinces.

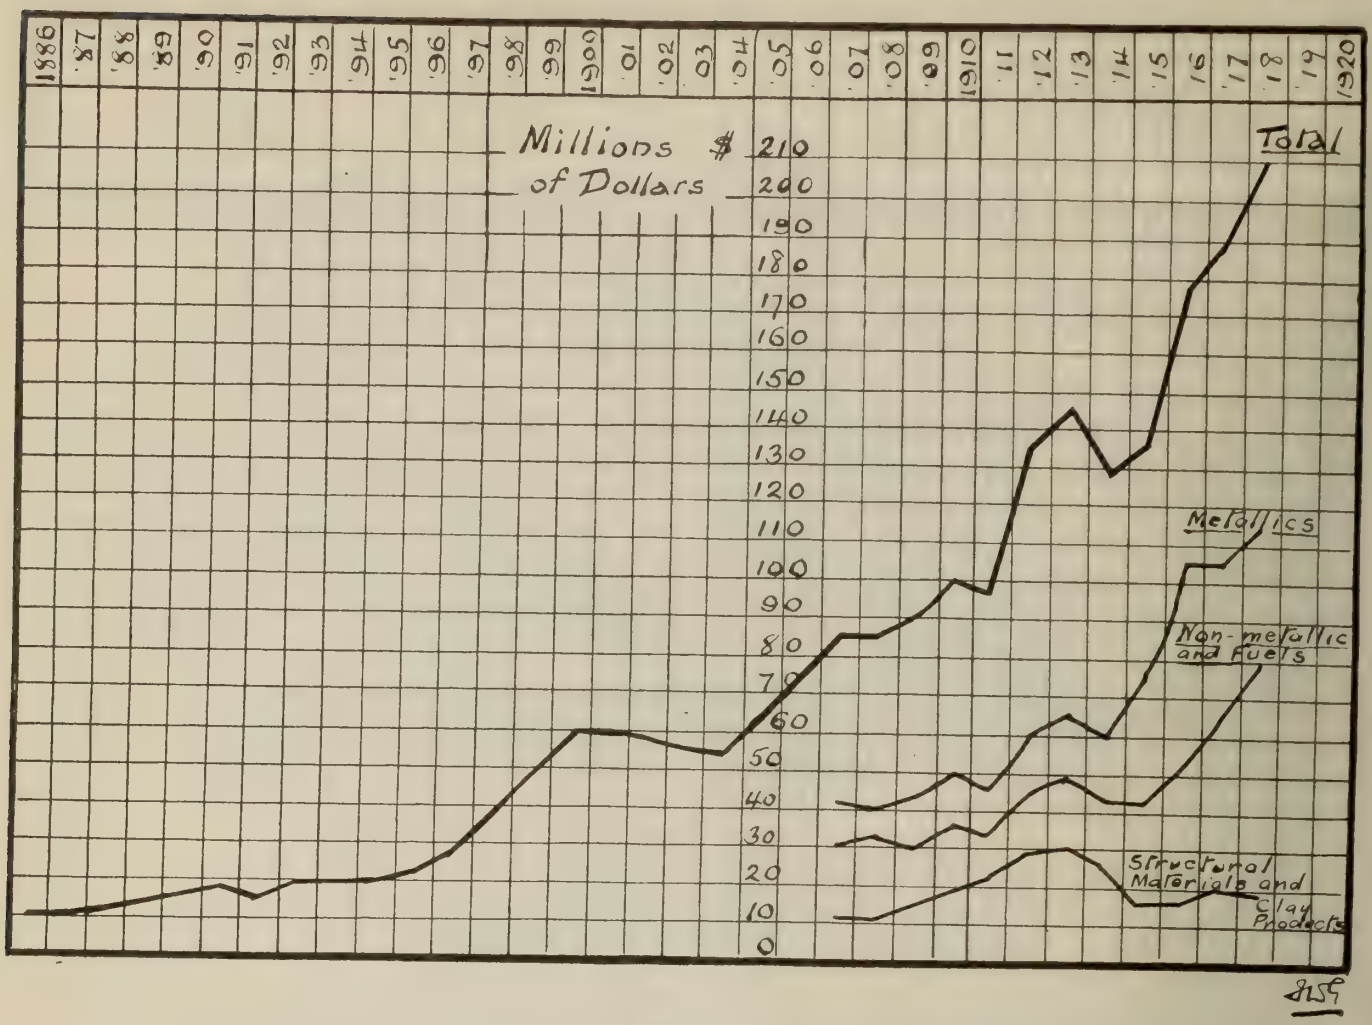

Fig. 2
Relative Value of Main Sub-divisions of Canadian Mineral Production.

opinion, the total annual production of coal from the Maritime Provinces is not likely ever to exceed ten million tons, which compares with an established maximum in 1913 of approximately 7½ million tons productive capacity.

Graph 2, shows the relative value of the main subdivisions of the mineral production of Canada employed in the Mines Branch statistics, which are only available in this form, in any completeness, since 1907.

The rising curve of the total value of mineral production is an impressive one, and visualises Canada's growth since the days of 1886, when Nova Scotia was the most important single contributor of mineral wealth, and that chiefly in the form of coal.

The effect of the war is well disclosed. The metallics—which include the bulk of the so-called "war minerals"—show the greatest advance from the low level of 1914, but, as will be observed from an inspection of Graph 3, the increase is more in monetary values than in weight of production.

In the non-metallics and fuels, the increase is also greatly due to the increased selling prices of coal, although it includes the effect of the increase in price in such war minerals as asbestos, chromite and magnesite.

The curve of the value of structural materials and clay products reflects the cessation in building activity which persisted right through the war period, and which still lingers in expectation of a coming decline in the costs of building materials—rather a vain hope we believe. Because of the high costs of building materials which have been manifest for a number of years past, the curve represents a smaller tonnage output than might at first sight appear to be indicated.

Graph 3 shows a selection of the more important minerals produced in Canada, the selection being purely arbitrary, and without significance, except as regards gross monetary values.

Coal shows up in its proper place as Canada's most important mineral asset, and a comparison between the curve of value, with its extraordinary jump since the year 1915, against the flat curve of actual tonnage production, will serve to emphasise, what is true of all the other minerals except gold, namely, a tremendous increase in unit values during the war period.

The curve of coal value has a far-reaching significance. There is no reasonable probability that coal will ever be mined more cheaply than it is today. That is to say, it may be mined at less apparent monetary cost when, and if, deflation should take place in gen-

eral commodity prices, but the expenditure in effort and the provision of the materials necessary to the extraction of coal, are outlays that must steadily increase, and the instrinsic value of coal will in the future become greater and greater from year to year as the available supply of the raw material is lessened, and as coal obtains a more and more extended use through the spread of the civilized arts to all quarters of the world.

Coal being the material on which all manufacturing costs are based, and a material which is moreover required to provide the power for the extraction of all other minerals, it follows that the curve of costs of most things must follow the curve of the cost, or market value of coal. As every indication forecasts a continuing increase in the selling price of coal, it seems fairly certain that a considerable proportion of the increased unit values of minerals is a permanent increase.

The high place occupied by nickel and copper production, and the declining curve of gold and silver values, will surprise a good many people who hear more of Cobalt and Porcupine than they do of Sudbury and Trail.

The curves display in an interesting way the chronology of Canadian mining. The Klondyke boom shows in the gold curve in the peak of 1900, four years after the discovery in 1896. The result of the discovery of the Cobalt silver veins in 1903 shows in the curve about 1905, rising rapidly to the large and sustained production of the period from 1910 to the outbreak of the war, when adverse influences affected both the market for silver and producing operations. The position of the silver curve in 1918 does not of course reflect the unpredented price of silver today, which in

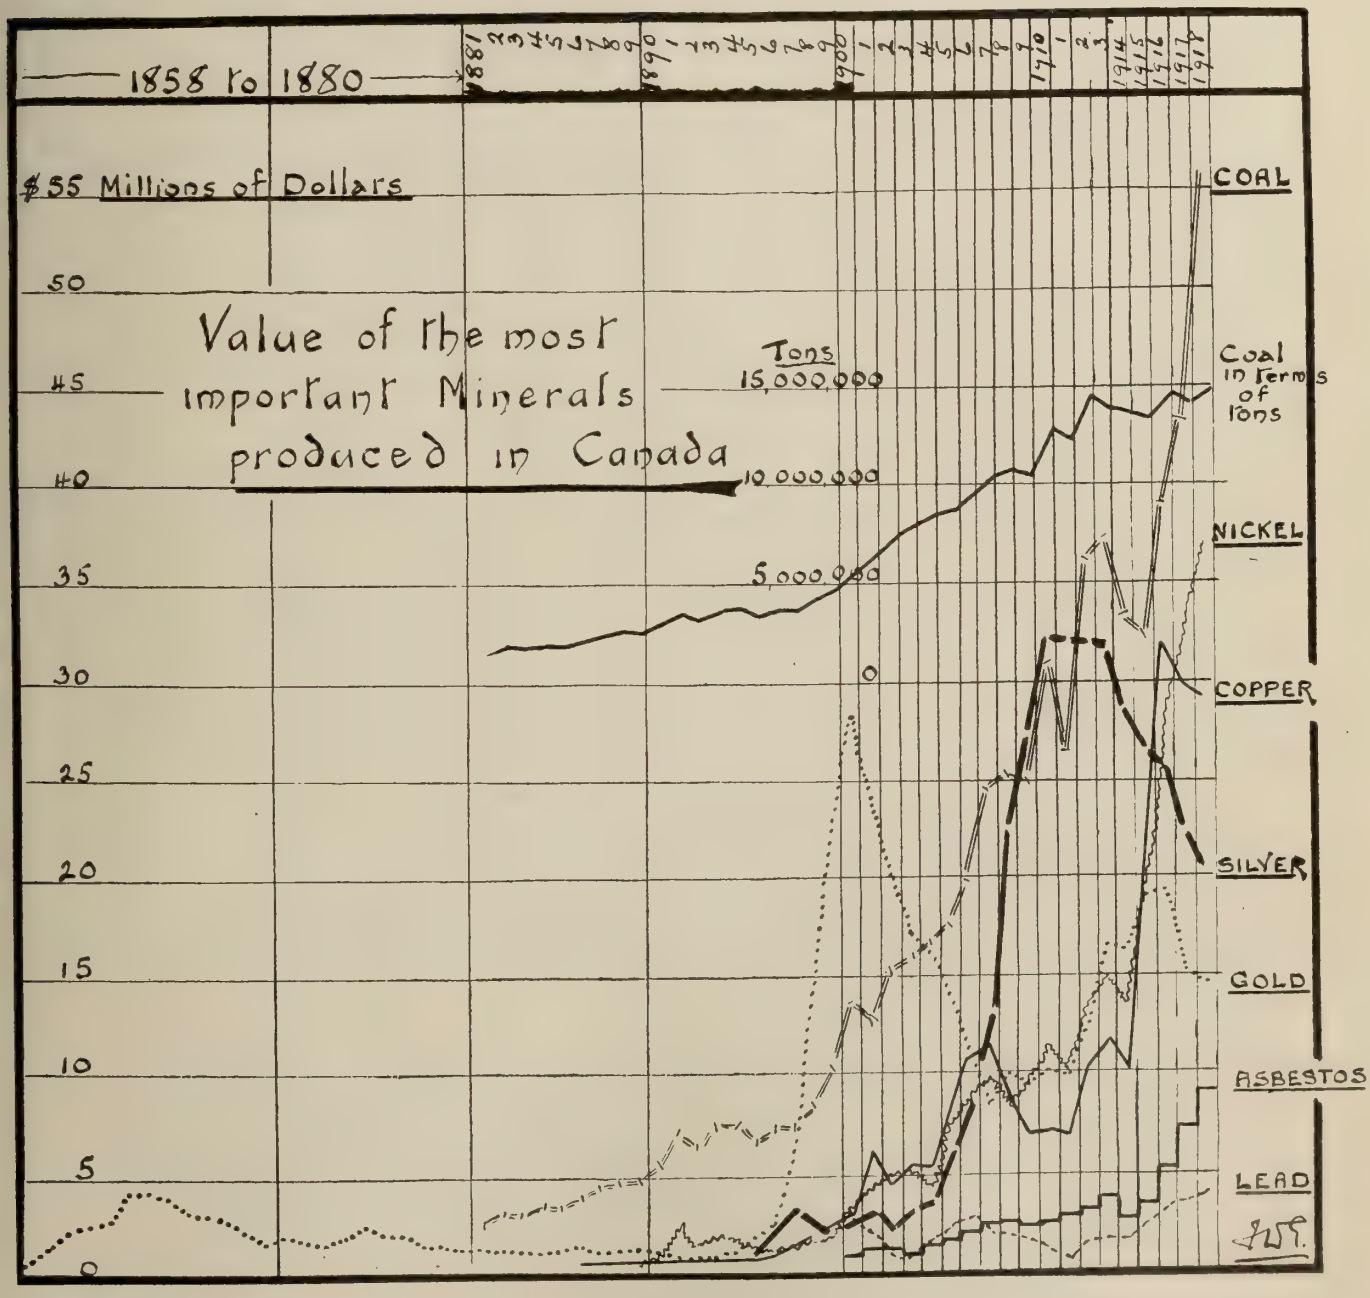

Fig. 3

the course of the year 1919, will to some extent offset the drawbacks to production that took place from various causes.

Copper, lead and asbestos all show the stimulus of war demand, while gold shows the effect of high costs of production and shortage of labor, combined with a fixed selling value for the product.

Iron ore is not shown in Graph 3, as its relative money value is small, and the production is stationary, or declining.

A previous article in the "Journal" (see page 606, issue of 13th August, 1919) contained graphs which showed in some detail the production and consumption in Canada, and the imports and exports into and from Canada, of iron-ore, iron and steel, coal and coke.

Those who are more familiar with the mining history of Canada than it is the writer's privilege to be, may recall many interesting things which the curves will suggest, which are not mentioned in this comment.

The graphs are published because they seem to form a convenient and easily comprehended summary of the chronology and unremitting progress of Canada's premier industry, and because they illustrate the value and wide scope of the work of compilation and recording which has been slowly built up in the Department of Mineral Resources and Statistics at Ottawa, without which the preparation of the accompanying graphs would have been a practical impossibility.

One general impression is conveyed by a study of the graphs, which it is not easy to express. It is perhaps a necessary concomitant of the early development of a highly mineralized continental area, not half prospected, that the curves suggest a certain fortuitousness in mineral discovery, or the chance uncovering of some of the mineral treasures of Canada. Possibly, Canada is now entering upon a period when mineral discovery will be of a more systematic and consistent nature, and when the curves will fluctuate only between small limits, but at high levels on the chart.

SAFETY WORK AT CALUMET AND ARIZONA MINES.

(By C. L. Colburn.)

The Calumet and Arizona Mining Company has established an efficient and progressive Department of Safety under the directions of Thomas Cowperthwaite, safety engineer. The Safety Department serves not only the Calumet and Arizona properties, but also associated companies; namely, the Calumet and Arizona smelter at Douglas, Arizona; New Cornelia Copper Co., at Ajo, Arizona; Warren-Bisbee railroad running between Warren and Bisbee; the Tucson-Cornelia and Gila Bend railroad running between Gila and Ajo. During November 1918, the Gadsden Copper Company at Jerome, Arizona, started development work and this also was taken in charge by the same safety department.

The Calumet and Arizona Mining Co., operates four large mines at Bisbee, employing about 1500 men underground and about 500 surface men during normal times. The smelter at Douglas employs about 800 men. The New Cornelia Copper Co., employs from 1000 to 1200 men during normal times and the Gadsden about 50

The safety system requires that all superintendents, foremen, shift bosses and others who have charge of men to be members of the safety committee. This is done for two reasons; first because the man who has charge of a piece of work should make observations regarding the conditions under which his men work, and should compel his men to exercise a reasonable amount of care, second it invites competition between those who have charge of men. The mines at Bisbee, the smelter at Douglas and the New Cornelia are always in competition with each other in safety matters. Their safety status is determined by figuring the yearly cost of accidents as compared to the pay roll. This method invites competition between the various superintendents who in turn require their foremen and shift bosses to use extra precautions to reduce their accidents to a minimum. At the New Cornelia copper mine, a committee composed of the heads of the various departments makes a trip around the plant and mine each month and reports the defects noted. This has proved very effective because each department head tries to find something wrong about his neighbor's department. All defects are reported to the Chief Inspector who investigates them and reports to the General Superintendent.

A bonus of $30 is paid to the boss whose gang works 2500 shifts without an accident requiring an employee to lay off. If a boss has 50 men he is credited with 50 shifts each day, therefore, it would take him 50 days to earn the bonus. A bonus of $100 is paid to the foreman who has the best yearly record. These bonuses have considerable influence in strengthening the competitive system. Each department head works to get better results than his colleagues. The Mining Department pays the following bonus to the men: any man employed who works one year without losing more than 30 days (except loss of time owing to serious sickness) receives a bonus of $100 for the first year. The second year he receives $110, the third year $120, and soon until the bonus amounts to $250. This is the largest amount paid.—Monthly Report of U. S. Bureau of Mines.

Mr. H. H. Sutherland, who has been critically ill in London, England, is reported to be much improved. A serious operation was necessary and there was doubt whether he would pull through, but he is now recovering rapidly. Mr. F. C. Sutherland is now with him.

Metachewan.

Diamond drilling is now in progress at the Matachewan gold mine and it is expected that vigorous development of the property will be carried on this winter. Plans are being made for the development of water power at Indian Chute on the Montreal River. It will probably be a year before this power is available for use. A very great reduction in power cost is expected and this should materially assist in the development of the Matachewan area.

Roof Control in Coal Mines

By JAMES ASHWORTH.

This subject is one of the most important of the large number of safety problems which have to be faced and vanquished by every colliery Engineer, Manager and official, and is moreover a most important matter of their daily work. On opening up a new coal mine the operators and engineers have to decide on what, in their opinion, will be the safest and most economical system for operating and extracting the largest per centage of the coal seam or seams. To arrive at this decision many things have to be taken into consideration, for instance, there may be a heavy overburden which means a huge pressure per superficial foot; (2), the overlying strata may be either very hard medium or very friable, particularly as regards the nether roof; (3) the floor also may be either favourable or unfavourable; (4), the seam may be abnormally thick; (5), its gaseous nature may be abnormal; (6), its faultings may require special attention, and lastly, it will be necessary to decide whether the coal shall be worked on the long-wall system or the pillar and stall or some modification of those systems.

In British Columbia the subject of Roof Control has not received as much notice as the subject deserves, and consequently great losses of valuable fuel have resulted. In some parts of the world careful records are kept of the tonnage of coal produced from any given area. Thus, supposing that an operator pays a royalty on the number of tons he extracts and sells, without any restrictions on his mode of extraction, he may through careless mining abandon large areas of pillars, but if on the other hand he is forced by the terms of his lease to pay for all the coal in the area under his holding at the rate of so much per foot thick per acre, then it will manifestly be to his advantage to extract every possible ton of saleable coal, and thus reduce his royalty charge to its lowest practicable amount.

"Roof Control" is a term which has been most generally used in connection with the long wall system of working coal, and in some districts especially in Great Britain has become so precise in its operation as to cause the roof to break with absolute regularity. Thus, the dirt and rock packs or walls in the goaves which mainly support the roof, also squeeze down with absolute regularity, and thus cause the roof pressure on the working coal face to be just sufficient to make the coal work and break down without any excessive crushing. In most of such cases the roadways are maintained by taking down part of the nether roof and using the material thus obtained to build pack walls which in time are crushed and become nearly as solid as the original strata.

Any system which is designed to produce this final result demands that as little as possible of the timber which has been used for the temporary support of the roof shall be allowed to remain in the goaves. Such systems therefore tend to save excessive costs in prop wood and chocks. Wherever any long wall system of working coal is put into operation for the first time, there is always a great tendency to leave timber in goaves to support the roof, whereas the real benefit to be derived from it is obtained by allowing the roof to break down or bend, and get into close contact with the floor in regular sequence. In a gaseous or fiery coal mine the long wall system of working will always give the safest results, because gas given off from the floor finds an easy escape over a large area, and avoids those dangerous localised outbreaks which are too frequently a feature of its escape in the limited area of the rooms of the pillar and stall system. The long wall system also assists in drawing gas out of the coal through the break in the roof which occur in advance of the working face. (see sketch Fig I).

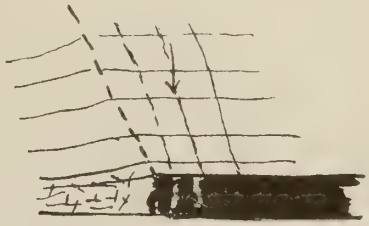

Fig. I

Roof Breaking in Advance of the Working Face.

Many carefully thought out papers have been written on the subject of roof control, and from at least one of these the writer proposes to make some apposite quotations.

"Quotations from authorities on Roof Control.

The author of most of the following quotations is Mr. H. W. G. Halbaum, who is well known through his connection with the Universal Mining School of Cardiff, Wales, and who in 1904 won the prize offered to the Institute of Mining Engineers by Mr. C. H. Claghorne. This paper was entitled "The Action, Influence and Control of the Roof in Longwall workings": and was published in Vol. xxvii. p. 205 1904. This was followed by a second paper on "The Great Planes of Strain in the Absolute Roof of Mines" (Vol. 30 p. 175-201), 1905-1906, from which the following notes have been taken.

"Have the forces which caused the thrust planes of Scotland absolutely ceased to exist? Have the forces which produced the cleavage plains in the coal seams of Northumberland and Durham left the strata in a state of high compression or not? Is resilence a property or not?.....The writer cannot but believe that the relief of high compression in mining strata provides a reservoir of horzontal force sufficient to impart the obliquity of the ascending line of strain.....

The case of "creep" is homely, but suggestive. If there is no real horizontal force, creep is an effect without a cause.....

The "creep" therefore is due to the true lateral extension of the strata beneath the under draw, Fig 2, and this lateral extension is due, evidently not so much to the vertical force transmitted through the coal stratum as to the pre-disposition (induced by super compression in situ), of the strata to extend themselves in the horizontal plane". You cannot break rock with a hammer whose head is formed with coal, neither

*Mining Engineer, Livingstone, Alberta.

can you transmit crushing stresses to rock through a coal medium enjoying lateral freedom..... To recognise a horizontal motive force, therefore is merely to recognise a difference of horizontal resistance.....

The relative draw extends from one eighth to two thirteenths of the depth of the surface.

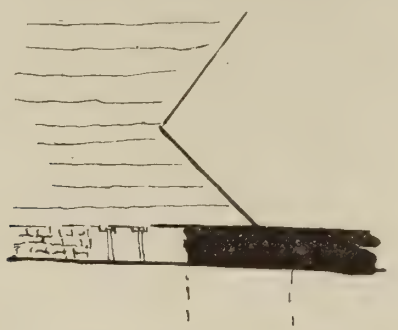

Fig. 2.
The "Under Draw".

Page 108 Vol. 30 Halbaum. Improbable Verticality of the Elementary Line.

"Consideration of the weight of strata overhead and of the strength of pit timber shows that mines must always be largely dependent on side thrust for the main support of the absolute roof, and this efficient side thrust can only be generated when the great lines of strain and principal fracture make an angle with the vertical. No one really believes that any wooden prop or any system of timbering can sustain either the dead or the live load—of the absolute roof. The office of the timber is merely to conserve the comparative integrity of the nether roof, and its efficiency is established when it performs this office successfully. The great lines of strain in the absolute roof are deflected from the vertical by angles which throw the bulk of the weight either back on the packs and dead strata or forward against the face of the prime strata. But if from any abnormal cause, they swing into the vertical line, the results are vertical slips of strata which may either smother the face of work, or superinduce those violent, though happily rare phenomena known as "bumps", outbursts of coal, liberation of large volumes of gas, with possible explosions of firedamp and wholesale destruction of life, limb and property. Such slips are strong presumptive evidence that the normal elementary line is not a vertical line. A vertical elementary line is an abnormal line, and produces abnormal phenomena.

Page 184,—mining engineers commonly say that the roof "arches itself". Fig. 3. An old road used as a return airway will arch itself, whether it runs in the direction of the working or at right angles thereto. Why? Because the roof of the road is a bridge across the road; a beam supported at both ends. Below the neutral surface, all the strains in the strata are tensile, above, all are in compression. When the bridge collapses, the roof arches itself.

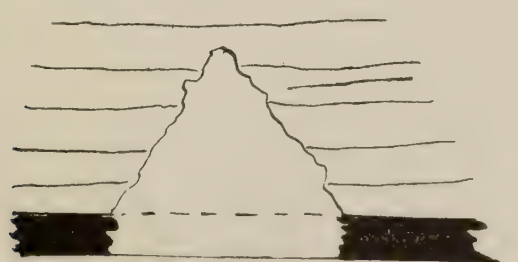

Fig. 3.
Roof Arching.

Page 185,—The arching of the nether roof is a very superficial process. The evidence for the great horizontal motive force which deflects the action of the absolute roof must be sought in the study of more massive phenomena.

Page 187,—And so the repetitive phenomena proceed to the very surface, each succeeding stratum, whether stable or unstable, propagating its strains further toward the solid than did the stratum below, and each, as it gives way, continually enlarging the area of subsidence. Thus the whole volume of subsided material finally assumes the approximate shape of an inverted conic frustrum, Fig. 4.

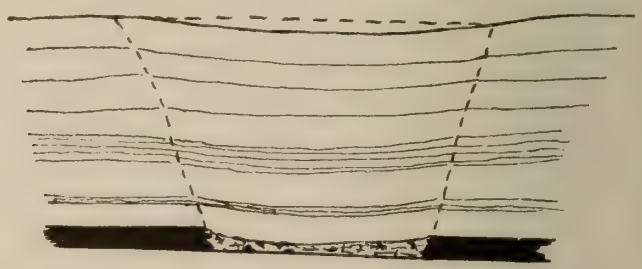

Fig. 4.
Showing upward propagation of subsidence strains.

Page 187,—The Cantilever Idea and its Corollary,—The conception of an ascending line of strain projecting over and towards the solid has been said to be incompatible with the idea of a cantilever action of the roof strata.....A cantilever possesses a neutral surface and above it all the stresses in the beam of strata are of the compressive order. The uppermost tensile stress and the lowermost compressive stress are the maxim of their respective orders; and both orders of stress regularly diminish as the planes on which they act approach nearer the neutral surface, at which plane both kinds of stress are reduced to zero."....When the roof of a road collapses, the roof arches itself and the wider parts of the arch occur where the tensile stresses are greatest.....The greater the stress is any given plane the greater will be the distance through which the resultant strain is propagated towards the solid." Thus in the cantilever of roof-strata, seeing that the maximum compressive stress obtains in the roof line, the strain in the immediate roof stratum must be propagated further towads the solid than the strain in the stratum next above will be propagated.... The compressive stress in the third stratum is again less than in the second, and the strain is propagated to a distance which falls short of that obtaining in the strata below; and so on until we arrive at the neutral surface where stress and strain vanish.

At the terrestrial surface we find the maximum probagation of tensile strain along the line of the draw and that the upper roof arches itself in obedience to the differential tensile stresses in the cantilever, but the arch is now an inverted one." Fig 5..

In all probability, the compressive component with its opposite obliquity is confined to the first few feet of, or above the roof stratum. The fact that it exists at all explains why careful timbering is requisite for

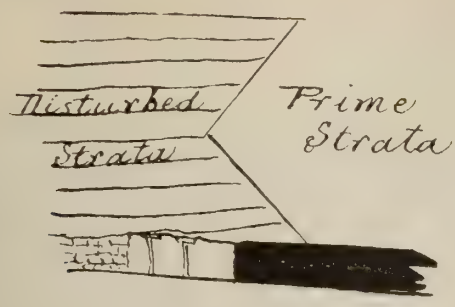

Fig. 5.

safety, and the exceeding superficiality of its extension explains why such timbering is sufficient to ensure safety."

Page 194,—So called good roofs, sandstones more than others perhaps, are peculiarly liable to those instantaneous reversals of stress which accompany any shift of the neutral surface; and this is so by reason of the peculiarly immense disparity of the respective resistances offered to tension and compression by any cantilever associated with an absolute roof the lower layers of which are chiefly furnished with a strong sandstone strata, or by other strata of similar nature.

Mr. Halbaum when writing the paper just referred to said that the first paper he wrote (his prize Paper), on The Action, Influence and Control of the Roof in Longwall Workings, (Inst.of Mining Engineers Vol. XXVII, 1904) would be better if read in the reverse order and therefore the quotations are in this order.

"The roof of a coal mine exerts two pressures. The first is a vertical pressure and due to gravity, and the second is a horizontal line of pressure due to the lateral compression of the rocks.

The influence of the roof on the coal to be gotten is to make the latter easier to be gotten.

In the bored and pillar system the action of the roof is more nearly allied to that of a simple weight,—in longwall it is more nearly allied to the action of a powerful lever,—we may bend the lever or we may snap it at its fulcrum.

Mysterious accidents due to falls of roof stratum sometimes occur under an apparently good roof. If we assume that the examination took place in the interval between the action of two stresses of opposite kinds the mystery disappears. We should therefore trust no roof whatever but carefully timber all.

In working to the dip the lateral thrust of strata beyond the face line is resisted by all the weight of the strata behind; whilst in working to the rise the lateral thrust of the strata beyond the face line is not merely unrestricted but is in a very positive sense facilitated by the weight, which naturally tends to slide down hill and thus accentuates the draw at the surface and exerts a mangling action on the coal head such as cannot be obtained in working to the dip. On the other hand, the roof is more liable to break off at the face line at rise workings, unless the packs be kept well up to the face.

Working to the rise also involves a larger expenditure of timber than does working to the dip.

Coal is more easily worked by the miner when the direction of the workings is at right angles with the direction of the cleavage.

In some cases it is necessary to change the direction of the line of working. The thrust which produces the draw at the surface and "mangles" the coal below is greater in magnitude and richest in power when the direction of working is at right angles to the line of cleavage. The compression of the coal itself is greatest in the line at right angles to the cleavage, and the coal is thus more likely (on its own account), to burst out from the face in such circumstances. The planes of cleavage divide the coal into a number of vertical slices, which run parallel with the face line.

Most long wall men prefer if possible to advance their longwall workings directly across the cleavage.

With a straight face roof action may be unduly violent and then the stepped longwall may be adopted and has often proved effective where a straight face was a practical impossibility.

We may find a weapon of roof control not only in the direction of working but also in the rate of working.

It is necessary to keep pack walls well up to the face of the coal.

The most successful working of longwall demands a roof only moderately strong.

Props tapered or chamfered at the ends ought to be used so that the ends will fuzz up instead of breaking when exposed to roof weight."

"Bumps" in coal mines of Crows Nest Pass District.

This question of roof control has been brought most prominently before the notice of coal mine owners, officials, miners and the public of Western Canada through several disasters at the Coal Creek mines of the Crows Nest Pass Coal Co. Ltd. A short resume of these will serve as an introduction to the subject, and possibly lead to practical solution of the problem of how to work these mines with greater safety, and with the least loss of coal. The frequency of what are locally termed "bumps", have made these mines notorious. Their cause being mainly attributed to movements of the roof strata, caused by insufficiency in the size of the pillars in the workings, but they were not seriously considered until after several fatal accidents had occurred.

The first recorded bump was in June 1906, on the south side of Coal Creek in No. 4 East level of No. 2 mine, when the floor was lifted. The 2nd and 3rd occurred in the month of August 1906, between Nos. 1 and 2 West levels, affecting the roof, and gas was given off. The 4th occurred on the 3rd of January 1907, in a room 18 feet wide, between Nos. 3 and 4 West levels, where the pillars were 25 feet wide. This bump caused an emission of gas, and displaced a piece of timber which fell on the miner and killed him. The 5th, occurred on the 22nd of July 1907, when a miner who was taking a skip off a pillar was killed by a fall of roof and side. Again on the 9th of October, a miner was suffocated by a sudden outburst of gas in a room off No. 4 West level. On the 19th of June, of the following year, three men were killed in a room off No. 6 West level, when the floor lifted to within two feet of the roof, and also gave off much gas.

Dept. of Mines directs new system of panels.

This accident caused in Minister of Mines to take action, and in June 1908, the Coal Co. were asked for a plan of a proposed new panel system of working, in which the rooms were to be 25 feet wide, and the

pillars 45 feet, but before it could be put into operation, another and more extensive bump occurred, viz, on the 31st of July 1908, somewhere between the 3rd and 4th West levels and westwardly of the main haulage road which was driven on a north and south line. At the time of the bump a skip was being taken off the side of the air road on the west side of the haulage road pillar. Three men were killed and one other who was rescued alive also died afterwards from shock. The bodies of one man and two horses were not recovered. It is known that the floor lifted and large volumes of gas were given off. To what extent the roof fell is not known, but some of it did fall. In all previous cases the lifting of the floor was the main feature of the disturbance, with an outburst of gas. In this latter case 24 men were involved, and twenty of them survived through making use of the air in the compressed air pipes which thus kept them alive for seven hours. The 9th and last bump in this area is said to have occurred on the 29th of September 1908 the effect of which was not known.

Provincial Mineralogist detailed to investigate and report.

After the bump of July 31st 1908, the B. C. Minister of Mines sent up his Provincial Mineralogist to make a special investigation and report, which was rendered on the 18th of November 1908. In this report very drastic recommendations were made but were however agreed to by the General Manager of the Company, although it entailed the entire closure of all the workings south of No. 1 West level. This area was outlined on the plan in red ink and comprised an area of over 50 acres. Further it was agreed that if the bumps continued this prescribed area might be enlarged. No roadways were to be driven through it, and it was also agreed to leave a barrier pillar between any new workings in the virgin coal and the prescribed area. It was also clearly explained that these definite conditions were laid down so as to prevent the company's officials changing this policy.

In additions to these restrictions a plan for the future development of the mine (No. 2), by a so called retreating long wall system of panels was agreed to, and development to carry out this plan was commenced, but on a change of management occurring it was found that the scheme was impracticable and later was entirely abandoned.

The new management then commenced to develop the same seam of coal from the main No. 3 slope, on the advancing long wall system, and this plan was followed for some years without any bump or gas outburst troubles, until another change in the management occurred, and it was decided to return to the pillar and stall system with larger pillars than had heretofore been customary. The main reason for this change appears to have been that the management thought that the pillar and stall system would produce cheaper coal than the long-wall system. This larger pillar and stall system has continued until the explosion in No. 3 mine in April 1917 brought the extraction of this coal seam to a temporary standstill.

Bumps were not however confined to No. 2 mine, and in 1916 there were bumps in No. 1 East mine, which are said to have exceeded in extent and destructiveness every other manifestation which had preceded them, though fortunately with a minimum loss of human life. These incidents are shortly reported by the Chief Inspector of mines in the annual report of the British Columbian Minister of Mines for 1916, as follows:—

Report of the Chief Inspector of Mines.

"On the 7th of November 1916, a series of bumps occurrel in No. 1 East mine of the Coal Creek colliery which completely wrecked the inner portion of the mine and caused the death of one man.

These bumps occurred during the early morning when the repairing shift was at work. A rescue party was quickly organised and on entering the mine found that all the men had escaped excepting one. Whilst attempting to reach the place where this man was supposed to be, another bump occurred about 5-20 a. m. Further rescue operations were then suspended for 24 hours, but were resumed and continued until Monday afternoon the 13th when, about 6 o'clock another severe bumps occurred and the rescue party was withdrawn.

It appears that a bump occurred during the afternoon shift of the 7th slightly injuring a miner in No. 9 room off No. 14 East level. The fire boss then removed the men, but owing to a cave in No. 8 room a horse was left inside.

The bumps of the 8th principally affected No. 14 East level though they also affected No. 12 West. The night repair shift of the 7th-8th finding the place "uneasy" retired back along the level, and here ten of them, with two firebosses, were blocked in by caves of roof on either side of them. After three hours work they managed to scramble out leaving one man and one horse unaccounted for.

The effect on the mine was, that all of it, to the south of No. 10 East and West levels was badly caved, in 65 working stalls all the stoppings being blown out, air doors destroyed, and fan air doors were forced open, the ventilation reversed, and the air concussion effects are said to have been felt five miles away.

Less than 25% of the coal had been taken out by the room workings and no pillaring had been done. Another bump on the 13th of November, again destroyed all the ventilating doors, and caused a great upheaval of the floor of the main haulage way for several hundred feet in the region of No. 12 levels. After this bump the Chief Inspector of Mines prohibited any further mining inside of No. 10 West level, i. e. southwards from the west side of the mine to Nos. 16 & 17 room on the East level."

Report of Mr. G. S. Rice of U.S.A. Bureau of Mines

Shortly afterwards the Hon. Lorne Campbell, Minister of Mines, called in Mr. G. S. Rice, of the U. S. A. Bureau of Mines, to report and advise as to the cause of the bumps, and the precautions which were necessary to prevent a recurrence This report has now been issued, and the present Minister of Mines, the Hon. Wm. Sloan, has also issued a pamphlet entitled "Summary of Principal Findings in the Crows Nest Field Investigation".

This summary was issued in December 1919. and has reference to the "bumps" in the workings of No. 1 East Mine on the south side of Coal Creek, Fernie, and is based on Mr. G. S. Rice's report.

(To be continued).

Sulphur in Coal*

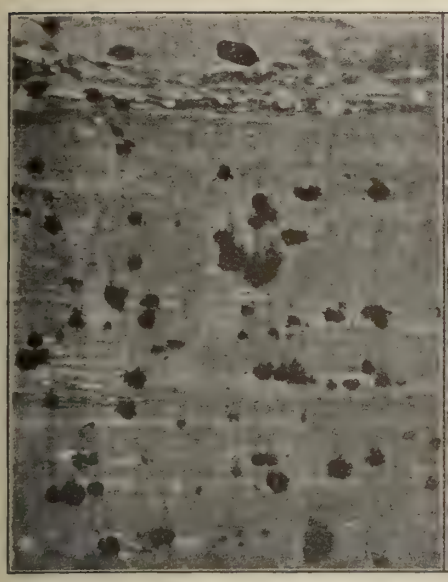

Fig. 1.

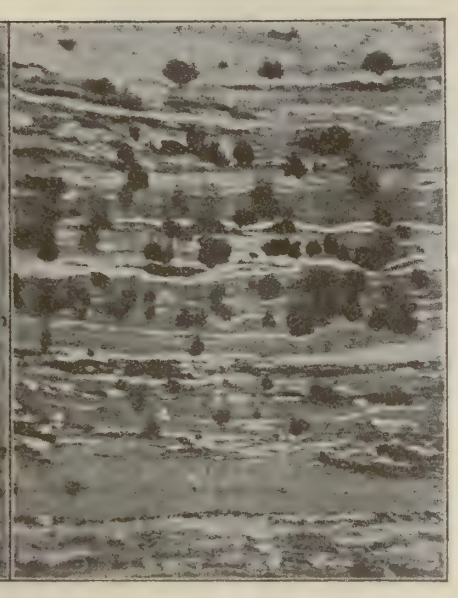

Fig. 2.

Fig. 1,—Thin cross section of coal from Vandalia mine No. 82, near Terre Haute, Ind., No. 5 bed, showing a thin layer of anthraxylous coal with numerous microscopic pyrite globules. Pyrite globules are shown black as irregular roughly rounded areas. Many have been partly broken and fragments, consisting of minute cubes, have been dragged to some distance over the section. Anthraxylon is that part of coal derived from parts of logs, stems, branches, or roots. × 100.

Fig. 2.—Thin cross-section of coal fromVandalia mine No. 82, near Terre Haute, Ind., from No. 5 bed, showing layer of dull coal containing numerous thin strips of anthraxylon embedded in an attritus or debris. Black, roughly round areas represent microscopic pyrite grains; white irregular strips represent cuticles; and short linear patches represent spores. Tendency of pyrite globules is to form rows along thin strips of anthraxylon. Attritus is that part of coal derived from all sorts of macerated plant parts and plant products. × 100.

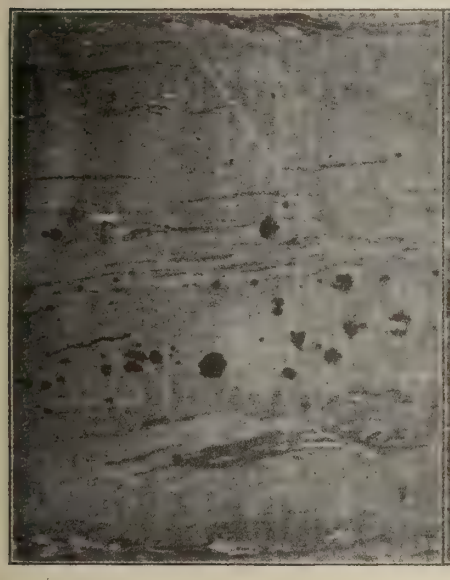

Fig. 3.

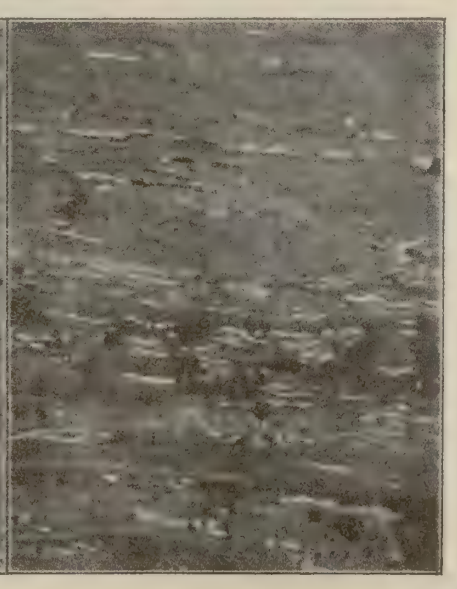

Fig. 4.

Fig. 3.—Thin cross-section of coal from La Salle, Ill., showing a layer of anthraxylous coal, including a number of pyrite globules. × 100.

Fig. 4.—Thin cross-section of coal from Sesser, Ill., No. 6 bed, showing pyrite globules in dull coal, which here is composed of thin strips of anthraxylon and attritus; the latter includes spores, shown white. × 100.

Reference was made in our editorial columns in the October issue to the very interesting symposium on sulphur in coal that took place at the Chicago meeting of the A. I. M. & M. E., and while a full reproduction of Dr. Reinhardt Thiessen's paper on this subject would probably not be desirable in a periodical that is prepared for persons who are more concerned in the uses of coal than with its origin or production, a condensation of Dr. Thiessen's treatise, with a reproduction of the microscopic sections on which his conclusions were mainly based, may be not improperly included.

Dr. Thiessen mentioned the better known, and grosser forms of sulphur occurrence in coal, in the form of balls, lenses, nodules, continuous layers, thin sheets and flakes occurring both in the horizontal planes and in the vertical cleavage fissures of coal as it lays in the seam. But pyrites also occur in very fine microscopic particles, disseminated or powdered throughout the compact coal. This form of pyrite occurrence has had little consideration.

All the coals examined by Dr. Thiessen contained a varying amount of sulphur in very small globules, or particles, of pyrite. Their minute size is best appreciated by comparing the illustrations accompanying, in which they are shown at a magnification of 100 diameters, which is equivalent to stating that the entire field covered by the individual slides represents actually a section of coal as large as the ordinary period used in print. The streaked appearance of the globules of pyrite is due to their breaking into innumerable cubical fragments in the process of cutting the section, which distorts the dots of pyrite to some extent.

The amount of pyrite in this form varies cconsiderably in different beds from which coals have been examined, and also in different samples from the same bed, or even in different parts of the same microscopic section. No coal section examined has been found did not contain pyrite particles, but no regularity of occurrence has been noticed.

The largest number of the pyrite globules is found in that part of the coal believed to be derived from the woody parts of plants.

Sulphur is an essential element in almost all proteins, which are essential to living organisms, and as coal is derived

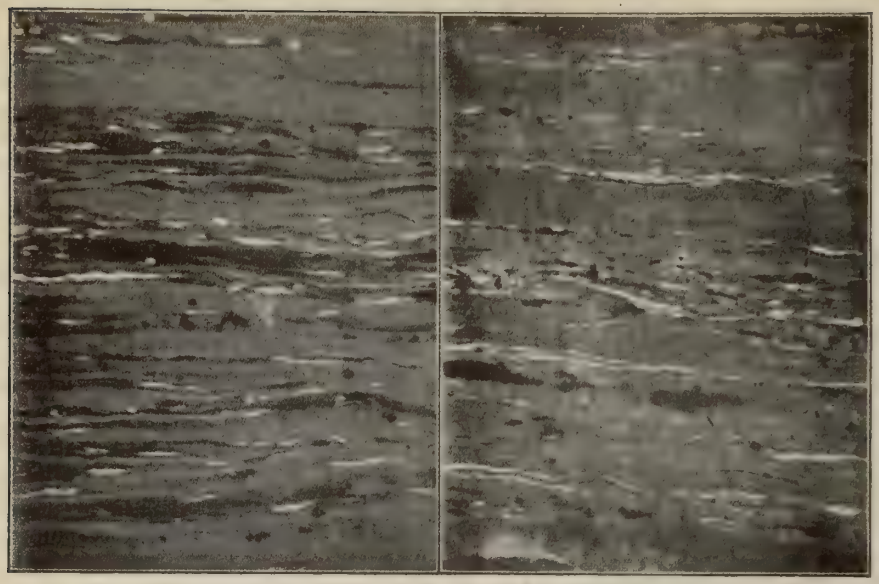

Fig. 5.

Fig. 6.

Fig. 5.—Thin cross-section of coal from Shelbyville, Shelby Co., Ill. Pyrite globules are distributed through whole section; here and there, several have joined and others have coalesced. Globules are somewhat smaller than in other sections shown. × 100.

Fig. 6.—Thin cross-section of coal from Sipsey mine of Black Creek bed, Ala. Some of pyrite globules have coalesced into lenticular masses, smaller globules are distributed through whole section. × 100.

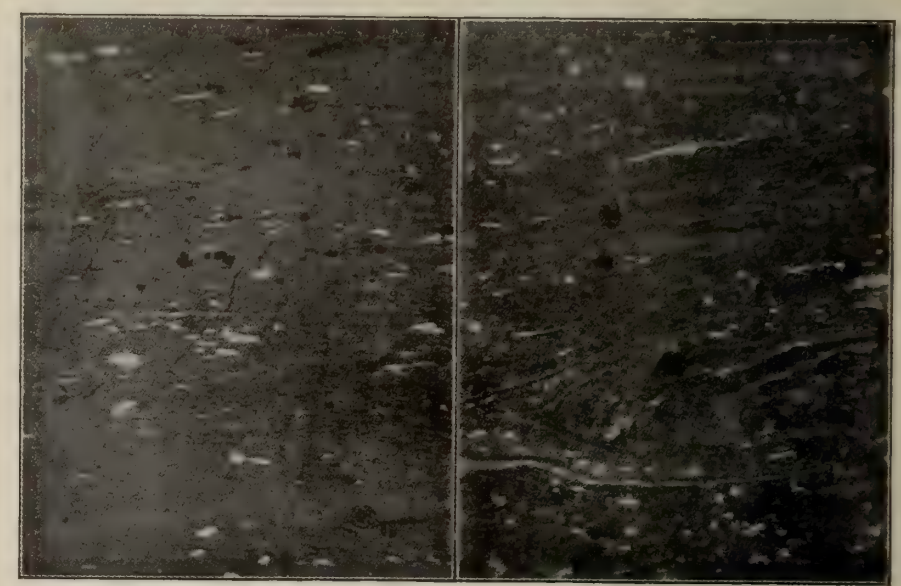

Fig. 7.

Fig. 8.

Fig. 7.—Thin cross-section of sub-bituminous coal from Stone Canyon, Contra Costa Co., Calif. Coal shown consists of rather finely macerated woody matter, including resinous particles and cuticles, besides pyrite globules, shown in black. × 100.

Fig. 8.—Thin cross-section of lignite from Montana. Section shown consists of macerated woody matter and other plant debris, including some spore and cuticular matter. Only two pyrite globules are shown. × 100.

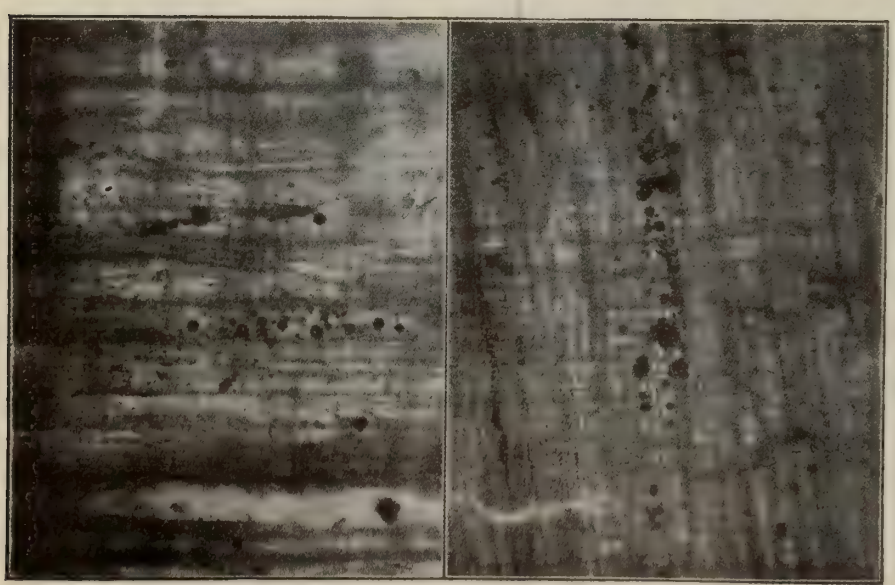

Fig. 9.

Fig. 10.

Fig. 9.—Thin section of woody peat, taken from peat bog near Hayton, Wis. Black dots represent pyrite globules lodged in wood fibers; several have been brokcn into minute cubical fragments. × 100.

from vegetation, it must contain at least as much sulphur as the substances from which it has been formed. This form of sulphur is not microscopically distinguishable, and is usually referred to as organically combined sulphur. Regarding this form of sulphur Dr. Thiessen says it has received much scientific attention but has not been sufficiently recognised on the economic side.

Non-protein sulphur exists in plants, and is particularly large in quantity in such odoriferous plants as onion, garlic and mustard, while in some wood ashes it is found up to 3.7 per cent in the case of white pine. Dr. Thiessen notes that the amount of sulphur in plant ashes is not a true index of the quantity present in the plant material, as a certain amount escapes in the burning.

Sulphur is found in all peats, and the process of growth of new and living organisms in the peat bog on top of the residue of plant growth that preceded them, causes a concentration of sulphur in the peat, which is found to contain by actual trial from 0.29 to 4.21 of sulphur. If therefore in the conversion of peat to coal a reduction to one-tenth of the original mass is assumed to have taken place, with no loss of sulphur, then the resultant coal would contain from 2.9 to 42.1 per cent of sulphur. There is therefore more than enough sulphur in peat to account for all the sulphur in coal.

Dr. Thiessen makes more interesting speculations on the part which is played by sulphur bacteria in reducing sulphur to a form in which it can be used by plants, but his remarks are in this respect extremely technical, and moreover the knowledge of the chemical reactions caused by these bacterial organisms is not exactly known today, so that no exact analogy can be drawn with what may have occurred in the age of coal deposition.

Dr. Thiessen's reasoning bears entirely on the form of disseminated sulphur shown in the slides, which he assumes, for the reasons mentioned, to have had a primary origin, and is found in coal today because it is a prime constitutent of the vegetation from which coal is formed.

The grosser forms of sulphur, such as balls, lenses and the large sheets of marcasite that occur in some coals, may have a secondary origin.

Dr. Thiessen's paper would appear to suggest that the "sink and float" test of the sulphur carrying elements in coal, preliminary to installing washing devices for the reduction of sulphur, might be usefully supplemented by microscopic examination of the coal.

F. W. G.

*Abstracted from a paper by Dr. Reinhardt Thiessen on "Occurrence and Origin of Finely Disseminated Sulphur Compounds in Coal", published by permission of Dirctor, U. S. Bureau of Mines, and read before the A. I. M. & M. E. Chicago, Sept. 1919.

COBALT.

Cobalt minerals are rather uncommon except in the Cobalt district, Ontario, Canada, where they occur in ores that are worked for their silver content, the cobalt produced being a by-product. The smelting and refining of this ore has recently been described by Sydney B. Wright (Mining and Scientific Press, Jan, 25, 1919, p. 125.) As these ores are brought to various smelters, according to changes in smelting contracts, the material comes on the market from different places at different times. In the main it is marketed as cobalt oxide, the metal is produced from the oxide by reduction. The principal use of the metal is in the patented alloy known as stellite (about 80 per cent cobalt) which is used as a high-speed cutting tool in place of steel (Transactions A.I.M.E. Vol. 44, p. 573). It is also used in a high-speed tool steel which contains 4 per cent cobalt and 16 per cent tungsten. It is also claimed that it can be used as a substitute for nickel in plating, the rate of deposition being faster than with nickel and a thinner coating giving equal protection. Other uses of cobalt compounds are in the making of insect poisons and also for coloring pottery and glass, to which it imports the shade known as Delft blue, and also certain purple shades.

Official statistics give the output in Canada in 1916 as 841,859 pounds; of which 215,215 lbs. was in the form of metal. The oxide produced amounted to 670,760 lb., and there were smaller quantities of sulphate, carbonate, and hydroxide of cobalt. Up to the present time the supply of cobalt available from the Canadian ores has been abundant to meet all demands.

There are only two sources of cobalt in the United States that are of any importance. A deposit at Blackbird, Idaho, is owned by the Haynes Stellite Co., which has erected a plant for the production of cobalt concentrates. Cobalt, nickel, and copper sulphides occur in association with lead ores at Fredericktown, Mo., and some cobalt oxide is now being produced by the Missouri Cobalt Co. The price of cobalt metal has averaged about $2.00 per pound in the United States.—From Monthly Report of U. S. Bureau of Mines.

Personals.

Mr. J. B. Tyrrell of Toronto expects to return to the district early in December to complete his examination of the Gold Pan property.

Mr. J. B. Tyrrell and Mr. Jas. McEvoy represented the Toronto branch of the Canadian Mining Institute at a meeting of engineers in Toronto on Nov. 25, to discuss proposed legislation with reference to the engineering profession.

The field geologists of the Ontario Bureau of Mines have all returned to Toronto. Mr. P. E. Hopkins is working on a report on the Shiningtree gold area which will be published soon. A detailed report on the geology of the Kirkland lake area is being prepared by A. G. Burrows and Mr. Hopkins who spent most of the summer in that area.

Mr. J. B. Tyrrell and Mr. R. E. Hore of Toronto will leave shortly to examine gold mines in the Rice Lake district, Manitoba. Mr. Tyrrell will complete his examination of the Gold Pan which he visited just before the freeze up. Mr. Hore will examine the Brooklyn mine.

Ontario's new Minister of Mines, Hon. Frank Mills, will leave Toronto this week to visit the Northern Ontario mining centres. It is probable that Premier Drury and the Minister of Lands and Forests will also make the trip.

Special Correspondence

NORTHERN ONTARIO.

The Silver Camps.

An outstanding feature in connection with the silver mining industry of Northern Ontario, inclusive of Cobalt and Gowganda, is the continued high quotations for silver at a time when the cost of producing is declining. A few of the operators, but not a majority, in spite of the contentions of metal authorities that the price would continue to rise, semed to be of opinion that a decline in the cost of producing would be attended with a more or less corresponding decline in quotations for silver. A few years ago, under normal conditions, it cost, roughly, an average of about 25 cents an ounce to produce silver. At that time 55 cents an ounce was considered to be a fair average price for silver, leaving a net profit of about 30 cents for each ounce produced. Now, with costs more than double, having risen to about 55 cents an ounce, and with silver qouted at upwards of $1.25 an ounce, a net profit of 70 cents is being realized on each ounce produced. The margin of net profit, therefore, is considerably more than double that of a few years ago.

From the foregoing, it would not be well to conclude that the mines are realizing aggregate net profits more than double that of a few years ago. The fact is, that production is recording a natural decline and at the present time is averaging only a little over one million ounces a month as against over two million ounces monthly in the camp's most productive days. Thus, one favorable factor, the high price of silver, and one unfavorable factor, the natural decline in output, serve to about balance one another in such a way as to leave the total net profit as a result of current operations about equal to that obtaining in the camp's most prosperous days.

The negotiations between the controlling interests of the Buffalo Mines and the Mining Corporation of Canada, which has been referred to in these columns as any notable progress was made, has terminated successfully. The deal is a private one insomuch as it was between Charles L. Denison, of New York and the Mining Corporation. For the time being the Buffalo company remains as it is, with the exception that a complete change is being made in the directorate and the management. The writer learns on good authority of the probability of the entire Buffalo company being ultimately taken over, now that control has actually passed to the Mining Corporation.

The Northern Customs Concentrator Company has opened negotiations with the Chambers-Ferland Company with the object in view of purchasing that part of the latter company's property lying adjacent to the La Rose Consolidated. At the time of writing, negotiations have reached an interesting stage and the outcome will probably be learned within the week.

During October the Kerr Lake mine produced approximately 112,000 ounces of silver, thus setting the highest record for some months. The value of the month's output amounted to close to $134,000, and is at the rate of around $1,608,800 a year, as compared with the last fiscal year's output of $1,637,143.

Net profits being realized by the Northern Customs Company as a result of operations being carried on in the old Silver Cliff mine is stated to approximate $25,500 a month, according to official advice to the writer. The property is being worked under lease which includes from surface down to 500 feet in depth. Below that depth, the Silver Cliff is involved in a special arrangement with the adjoining National Mines.

At a depth of 750 feet on the Beaver Consolidated, some exceedingly spectacular ore is being encountered, the richer shoots containing ore carrying from 5000 to 10,000 ounces of silver to the ton.

At a number of the mines, workmen's committees are being formed, along the lines of the agreement between the employes and the mining companies at the time the recent labor strike ended. This leaves the Cobalt Miners' Union without authority, in that the arrangement is one strictly between the various companies and their own employes. The Kerr Lake is among the first to carry out the scheme. A committee has now been formed, composed entirely of Kerr Lake employes. This committee is encouraged to present to the management any grievance which any of the employes may entertain. In this way it is expected that no difficulty will be experienced in relation to matters of welfare for the men. Already the plan is stated to give excellent promise of the desired success.

Arrangements are being made to carry out a diamond drilling programme on the Adanac, in that part of the property lying adjacent to the Gans property of the Temiskaming. It is proposed to drill from a cross-cut at the 310-ft. level. In this part of the property the formation is entirely diabase and the exploration of that area is *not* in accordance with the recommendations of geologists. The reason for adopting this course is due to the success which the Temiskaming Company has met with in exploring the Gans lot. The work will commence as soon as a drilling machine can be procured.

The plan to construct light railways to the outlying mining camps is making satisfactory progress, according to late information. A new company has been incorporated, to be known as the Canadian Light Railway Construction Company, Limited, with a capitalization of $500,000. J. Roebuck, C. J. Corless and W. B. Jones, Toronto, are the incorporators. It is planned to commence actual work next spring.

From the details now available, it is learned that equipment originally purchased by the United States government for use behind the fighting lines in France is being secured. It consists of 30-pound rails, 39-inch gage, the motive power being supplied by 12-ton oil-burning steam engines. The project is one which appears to be quite feasible and may reasonably offer a solution of the transportation problem peculiar to the various outlying districts. In this it is considered probable that the government will offer every reasonable encouragement to those at the head of the new enterprise. Incidentally it seems to open a field in which the various governments may be able to turn much of their transport equipment to continued national good. Also, another factor, and a big one in the North, the success of such a scheme would tend to relieve the government of the burdens of constructing many truck or macadam roads and the attendant costly upkeep.

Regarding the Bailey-Cobalt litigation and the question of whether or not the offer of the Northern Customs Company will be accepted, the case was heard before Mr. Justice Sutherland at Osgoode Hall, on Nov. 19th, decision being reserved.

The winding up of the affairs of the old Majestic-Cobalt is being concluded, according to advice just to hand.

Regarding the question of organizing the Northern part of the province of Ontario so as to gain increased governmental recognition, arrangements are being made to get in touch with all centres in the north. A monster convention is being planned for the next month or so, it being stated among a number of leaders in the movement that the question of secession from Southern Ontario will be considered "a proper subject for discussion."

Gold Mining Districts.

The Hollinger Consolidated dividend payable December 2nd will call for the disbursement of some $246,000. It is expected to be followed by a similar disbursement four weeks later. As to whether or not the New Year will be marked by an increase in the dividend rate, considerable speculation is heard. However, those in more or less close touch with the directorate do not appear to anticipate any increase for a few months longer.

The McIntyre-Porcupine intends to carry out the recently proposed experiments in connection with mechanical muckers. Should this method prove satisfactory it will solve to some extent the present difficulty of securing unskilled labor.

At the Dome Mines considerable attention is being devoted to the development of the Dome Extension. Facilities have been provided whereby it will now be possible to treat a substantial tonnage of ore from the 600-ft. level of the Dome Extension. Apart from this the week appears to have not been marked with anything of more than usual interest at the Dome.

According to official advice, the Porcupine-Keora will be developed to a depth of 250 feet, and a contract for sinking will be let. The management is now engaged in procuring a mining plant, during the installation of which it is proposed to carry on work by hand. The camp buildings are being put in habitable condition. Regarding reports that a mill was to be installed, the deport is decidedly premature to say the least, in that the management plans some actual development work before taking such a step. The Keora is situated in the north part of the township of Whitney, in the Porcupine district.

Satisfactory progress is being made in the development of the Clifton-Porcupine, a considerable tonnage of commercial ore having been opened up. Ore is said to occur on several faces throughout the underground workings.

In connection with the Gold Reef, relative to the recent increase in capital from $1,000,000 to $3,000,000 for the purpose of making possible more aggressive work, nothing of a definite nature appears to have been announced with the exception that the increase in capitalization was ratified. As to the plans of financing and the work proposed, no official statement has been made.

In the Kirkland Lake field satisfactory progress continues, and the result of the first month of operation following the ending of the labor strike is being awaited.

Activity is gradually extending in an easterly direction from the known productive area, and the township of Lebel is coming in for increased attention. The geological conditions in that direction are favorable, and encourages the belief that important developments may be expected. A number of small operations are under way, and the reward so far has been quite promising.

The districts of Boston Creek, Skead township and Larder Lake continue active and the result of work is steadily adding to the potential value of these districts. With the arrival of good sleighing which will make transportation less difficult, work will take on increased proportions. This is also true of the Fort Matachewan gold area. In regard to Fort Matachewan, the diamond drill will be employed again this winter in further exploring the Matachewan Gold Mines (formerly the Otisses) as well as exploring the Robb-Clemens claims which were recently optioned to Smith and Norrington, both of whom are interested in the Allied Gold Mines of Boston Creek. It is stated officially to the writer, however, that the Allied Gold Mines is not involved in the present option on the Robb-Clemens property.

In a general way, interest in gold mining is increasing, and capital, attracted by an opportunity to participate in the development of such a promising mining area, is coming in with increasing volume from the United States and from abroad.

Seven cases are listed for the sittings of Mining Commissioner T. E. Godson, K.C., to be held in Haileybury, on Wednesday, Nov. 26. Following is a summary:—

Thomas Burns vs. John Walsh, being an appeal from the decision of the Mining Recorder in refusing to accept applications for restaked claims L-8065, 8064, formerly L-2515 and 2516.

D. D. Chisholm vs. D. H. Gardner, being a dispute in respect of claims GG. 4144 and GG. 4146.

A. Koury (Thomas Boursk) vs. Robert Fereguson, being a dispute respecting claim L. 7405.

W. H. O'Connell vs. R. R. Campbell which is an application under section 81 of the Mining Act of Ontario in respect of mining claims L-6784 and L-6785 (now L.S. 84 and 85).

Robert Bruce vs. D. D. Chisholm (Donald McDougall), being a dispute in respect of mining claim GG. 4203 situate in Nicol township in the Gowganda Mining Division.

Sandy McIntyre vs. C. E. Pimelle, being a dispute in respect of mining claims L-6872 and L-7295 situate in Lebel township in the Larder Lake Mining Division.

John Y. Cole vs. Donald B. Menzies, being application in respect of mining claim L-3660, L-3663 and L-3664 situate in the Larder Lake Mining Division.

During the week ended Nov. 21st, four Cobalt companies shipped an aggregate of 369,560 pounds of ore. The week's shipments were considerably below normal. Following is a summary:

Ore Shipments.

Shippers.	Cars.	Pounds.
Buffalo	1	109,290
McKinley-Darragh	1	105,659
Mining Corp.	1	92,611
Dominion Reduction	1	62,000
Totals	4	369,560

Bullion Shipments.

While ore shipments were low during the week, the shipments of bullion were comparatively heavy, the Nipissing sending out two consignments and the Mining Corporation one, the whole amounting to close to one-quarter of a million ounces. Following is a summary:

Shipper.	Bars.	Ounces.
Nipissing	132	176,839.58
Mining Corporation	73	72,808.89
Totals.	205	249,648.47

The combined value of the silver at present quotations and the value of the ore amounted to upwards of $350,000.

BRITISH COLUMBIA.

Salmon River, B. C.

On the Forty-Nine Property development is being continued energetically and is expected to be maintained throughout the winter. Mr. H. Howson, who is in charge, states that both the Occidental and the Forty-Nine Tunnels are being driven ahead, the former in shipping ore and the latter in a good concentrating grade. The Forty Nine Tunnel was driven as a crosscut to tap the vein and when the ore body was reached was continued as a drift. It is heading towards the high grade ore which shows on the outcrop. Mr. Howson says that, if the transportation facilities were available, the property could be shipping now. The camp is as comfortable as circumstances will permit being laid out and built on modern plans, with baths, hot and cold water, oil heaters; the best of food and a good cook also being provided. Besides there is a completely equipped assay office. As the first man went on the ground as late as the first of July last it is thought that a record of accomplishment has been made.

A large motorsled ore truck has arrived at Stewart B. C. for the Premier Gold Mining Company. This is expected to be the forerunner of a battery of the same, it being confidently anticipated that the truck will do the work for which she was purchased, namely, carry the ore over the winter trail from the mine to tidewater. It is likely that the new hauling device will be tried out about the middle of December, as the heavy snow, as a rule, does not come until about that time. It is the intention to install compressor machinery at the Mine and to put in power drills. An electric light plant has been installed and the bunk house, cook house, compressor building, and ore sorting shed are to be lighted by electricity. The wires will be carried to the mine entrance.

Other properties which, according to a definite statement, will be active this winter are the Big Missouri Mineral Hill, and Bush, while it is considered likely that the New Alaska will be developed to some extent. On the property of the Bush Mines, Limited, which is situated just the northeast of the Premier, work is underway under the superintendency of Mr. H. Tanner. The result to date are said to be encouraging. O. B. Bush, of this Company, and head of the Company formerly operating the Premier, has returned to Stewarts and intimates that an extensive programme of development has been decided upon.

On the Mineral Hill development is in charge of Mr. Al. Harris, the work being done on the Joker Claim. The Joker has a good body of ore and promises to become a mine.

A tunnel is being driven on the New Alaska under contract by Angus McKenzie and partner. Mr. Charles F. Caldwell is the head of this Company.

The Hercules and the Indian are two claims which are expected to receive early attention. The Company holding the latter owns four claims on the west side of Cascade Creek, opposite the Bush Claims on the south end of the Missouri ridge, between the Salmon River glacier and the Cascade Creek. The claims are Portland No. 1, Portland No. 2, Big Dick, and Fritz. They are Crown-granted. They are at an elevation of 2400 feet and fourteen miles from Stewart. No work has been done on them since 1913.

Development consists of three open-cuts on the croppings and two tunnels. The open-cuts expose a vein from 12 to 20 ft. in width, which can be followed on the surface to the limit of the claims, about 2,000 feet. The vein is quartz and appears to follow a wide dioritic dyke which intrudes the greenstone-schists. The minerals of the quartz are galena, sphalerite, and pyrites. The first two open-cuts going up the hill show very little galena; the values are about $10 a ton in gold and silver for a width of 12 feet. The upper or main open-cut discloses the vein for a width of 20 feet, of which 5 to 8 feet in the centre is rich in galena, with zinc and galena on the hanging wall, while the balance of the vein on the foot-wall is of quartz and pyrites.

A tunnel has been driven on the vein for a little over 400 feet, showing each of the ore-shoots exposed on the surface. The No. 1 Shoot shows considerable galena at a depth of 150 feet with quartz pyrites predominating. The No. 2 Shoot is entirely of quartz and pyrites and will average about $10 a ton mainly in gold values. The No. 3, or main shoot, from the big cropping on the surface, was struck at about 400 feet in the tunnel and drifted on for 30 feet. The ore started from a seam on the foot-wall and has widened to 14 feet at the face, as exposed by two cross-cuts. Three sectional samples across the face averaged $2.40 in gold, 3.5 oz. siver, 10 per cent lead, and 16 per cent zinc. The hanging wall crosscut at the face is still in heavy zinc ore. Further work in driving this drift is considered important as the foot wall portion of the vein, carrying the galena, is widening and has all the appearance of developing into a good shoot.

The lower tunnel, 150 feet below No. 1, has been driven about 60 feet on the vein, in which there is from 1 to 3 feet of good ore on the hanging wall. On the upper end of the elaims there is a 6-inch seam of ore on the hanging wall assaying as high as $120 a ton in gold.

Adjoining the Indian Group on the North is the Boundary Group, owned by D. J. McIntominey and under bond to the Granby Consolidated Mining and Smelting Company. East of this Group and adjoining the Indian on the north is the Payroll Group, owned by W. Murphy, on which only assessment work has been done in recent years. This group is situated on the east bank of Silver Creek near its head. The vein has been exposed by three open-cuts showing about 8 inches of galena in a quartz vein which lies on a dip of 45 degrees. A tunnel has been driven forty feet on the vein from Silver Creek, 200 feet below the upper cut.

North and adjoining the Big Missouri Group is the property of the Hercules Mining Company, of Victoria, B. C., on which no work of importance has been done for some time. The Group consists of three claims, Yellowstone, Butte and Old Timer. It is under bond to C. F. Caldwell and associates. The formation is a continuation of the Big Missouri zone and the mineralization identical. Development work consists of seven open-cuts opening up a vein in places is 30 feet in width.

Mr. Bush has announced that a new company, the B. C. Silver Mines, Limited, has taken over the Lake and O'Leary Property between the Premier and the Bush Claims as well as the Mountain Group between the Premier and the International on Salmon River.

Late reports from Stewart and Hyder, the sister mining camps which, situated on the waterfront at the head of Portland Canal, the former on the Canadian side and the latter a few miles to the north and in

American territory, form the gateways to the Salmon River district indicate that both communities are humming. They are described—and this applies particularly to Hyder—as being typical old-time frontier mining towns. Hyder seems to be the centre of entertainment. Prospectors and miners from the mines in the interior to spend a holiday reach this town first and not infrequently return to the hills to earn the wherewithal for more indulgence without getting as far as Stewart. The town's buildings are built on piles. There is one main street, which runs in conformity with the sinuosities of the shore. It has its newspaper, as also has Stewart and both seem to flourish despite the compartive sparcity of population and what must be pretty keen competition.

An amusing phase of the life of Hyder is the activity of a character known as "Jack the Rescuer." A sharp twist in the main street, at a point where the sidewalk is without a protecting railing and where, below, is the cozy mud of the tide flats—sometimes covered with water to the depth of an average person's waist and at others with its slimy surface bared so that the spoutings of the sportive clams may be plainly seen—makes a veritable trap for the unwary. To say that absent minded, or temporarily befogged, pedestrians are frequently precipitated from the walk into the cold water and the mud is no exaggeration. In fact it happens so often that "Jack the Rescuer" earns a comfortable living, and a little over to have an occasional whirl on the roulette wheel, by standing at a post overlooking the critical spot, and, as they fall, pulling them back, wet, mud from head to feet and cussing most blasphemously, at a fee of $2.50 per rescue. Everybody knows the danger; everybody laughs at the other fellow's tumble; and yet; it would appear, Jack's business never grows slack. His rope was just as much in demand at last reports as it was at the beginning of Hyder's recently resuscitated and now hectic life. A few weeks ago the editor of Hyder's newspaper published a humorous story about some unfortunate's fall. The very next day, the writer, who had laughed, tripped and had need of the services of Jack the Rescuer. Never could there have been a more fitting illustration of the wisdom of the adage "he who laughs last laughs best."

But it must not be supposed that Hyder and Stewart are busy only in giving the workers some joy in life. Both look forward to becoming permanent communities of importance. That their future is bright is the opinion of mining men who have been into the Salmon River Country and of businessmen who have opened up in either one or the other of the towns. Not long ago it is reported that $50,000 worth of lots were sold in Hyder in one afternoon. When it is remembered that the town, for the most part has piles for its foundation, it must be admitted that this is "going some."

The High-Cost of Living, too, is an actuality in these camps, although it does not worry the miners much. All have plenty to eat because there are few without adequate funds and, for those who run short, there is work. Transportation of ore from the Premier Mine to the coast costs $121 a ton and the rate is the same for the transport of supplies the other way. The cost of hay is so high that those who have horses are shipping them to Porcher Island, situated at about the mouth of Portland Canal, for the winter. In the few months which must elapse before the spring opens and horses can be used, they would consume more than their value in feed. Hence the general exodus of horses to Porcher Islands. Forty head were brought down by the last outgoing boat.

Barkerville, B. C.

Robt. A. Bryce, a well-known Canadian engineer, who is in charge of the development work now underway at Proserpine Mountain, Cariboo District, visited the Coast recently. He called on Hon. Wm. Sloan, Minister of Mines, Victoria, B. C., to whom he spoke of the work being done by the Mining Corporation of Canada and referred optimistically to the prospects.

That the Armstrong and Dufferin Groups of Claims, which are situated on Grouse Creek, are to be thoroughly tested and that, if the results are what is expected, the exquipment necessary to the working of the properties on a large scale will be installed are statements made by Mr. Bryce. He says that he has assembled a good capable crew of men, that the veins are being systematically stripped, that considerable tunneling is to be done, and that, if progress continues at the present rate, the required definite knowledge of the properties should be obtained by the Spring.

The activity of Mr. Bryce and his associates in this district has attracted the attention of many prospectors. The hills are being thoroughly searched for mineral and many claims are being staked.

Among those who are trying their luck in the Cariboo are J. F. McConnell, a well-known newspaper writer of Vancouver, B. C., who has taken a lay on some promising placer ground. With him are associated "Tommy" Burns, former champion heavyweight pubilist; a sport writer, also of Vancouver, B. C.; and a civil engineer of the same City. Although they are somewhat new to the mining game with the exception of Mr. McConnell, who has had some experience in late years, they are reported to be working energetically. The results of their efforts are said to be satisfactory and it is not improbable that this partnership, odd as it may appears to many of their city friends, will reap a golden reward.

Cowichan, B. C.

The Manganese Property, known as Hill 60, has passed out of the prospect stage. It now is known to be a mine in its potentialities. Work has been suspended temporarily owing to the impassability of the roads, which condition is accounted for by recent heavy rains, and the Company is considering plans for the construction of an aerial tramway. This would materially reduce the cost and expedite transportation of ore from the mountain top. During the past two months eleven cars of the ore of this property have been shipped to the Bilrow Alloys Co., Tacoma, Wn., and the latter report that it is the best manganese ore they have handled. Sufficient development has been done to prove that a very large body of this high-grade manganese ore exists. The success of the enterprise, it is thought, may lead to the development of the manganese deposit of Shaw Creek, near Cowichan Lake, which received some attention during the latter days of the war, when the mineral was much in demand, but which has not as yet been systematically developed.

Nelson, B. C.

The Mountain Chief Copper Property at Renata, B. C., after much development with satisfactory results, is now in a position to commence regular shipments to the Trail Smelter at the rate of from 200 to 500 tons a week. Transportation facilities, however, permit no more at present than 200 tons a week and it is understood that this quantity will be forwarded as long as the Arrow Lakes are sufficiently free from ice

to permit passage of the lake barges. With the installation of a compressor and hoist, which is now taking place, and the provision of a motor truck to convey the ore from the lower terminal of the 3200-foot tram from the workings on Dog Creek to Renata, the mine is equipped for economical operation, and the next step will be in the direction of deep development by sinking.

Writing from the Slocan George Huston, a geologist who makes frequent visits to British Columbia and who now is engaged on examination work, describes impressions received as a result of a recent visit to the Noble Five Mine, in which James Dunsmuir, the wealthy coal operator of Victoria, B.C., is interested as follows:

"I was shown a sample of galena ore from the deep workings of the Noble Five Mine at Cody, near Sandon, which is a strong indication of durability with great depth in the Slocan Mines. This sample was taken from 20 inches of shipping ore out at a depth of 3,000 feet below the apex.

"Being familiar with the Coeur d'Alene mining and geodogical conditions, the point that impresses favorably is the almost entire absence of strong pressure in the sample, together with the unusual features that accompany ores taken at the same or greater depths in the Coeur d'Alene region.

Mining in the Coeur d'Alenes has not reached depths of from 3,000 to 4,000 feet below the apex, and a far different type of ore has been found to occur. There is a notable reduction in the size of the crystals, with a densifying of the structure and a greater intercrystallization between minerals. All this results in making a bad ore to mill, with greater losses in the operation and usually a lower grade of concentrate. Crushing and grinding are also more difficult, due to hardening and greater dissemination. The siderite usually found from the surface down changes to magnetite or coarse grained pyrite, or sometimes straight quartzose gangue. The features mentioned are the result of the enormous rock pressure exerted by great weight on the ore fissures.

"But the sample of the Noble Five, cut at 3,000 feet depth, shows a comparatively coarse crystal, brittle, loose structure, with the same minerals as gangue occurring near the surface. The sample has been but slightly affected by the pressure of rock weight, and is as easy to handle in a milling or sorting and crushing sense as ores near the surface. It is generally admitted that there is a lowering of the silver value to the unit of lead in the Coeur d'Alenes at great depth, but the Noble Five samples holds its usual percentage, and from other Slocan ores studied I found the same rule to prevail.

"A great deal of the silver ore in the United States is being treated by chemical processes, and escapes the smelter's handling.

"With lead ore decreasing in the silver content there now is a sharp demand for galenas carrying good silver values from the smelting plants to the south. This is bound to result in future competition in the effort to fatten up the bullion, and I look to see an influx of mining people to British Columbia during the next year from this feature alone."

C. F. Caldwell, prominent in British Columbia, where he has been engaged for years as a mine operator, has returned from a visit to Eastern Canada and the United States with the report that the East "is awake to the mining wealth of the British Columbia interior, to the riches of the coast mineral region and of the great northland." He says that a knowledge of the possibilities of these sections as an investment field is gaining ground, and there is no doubt that capital may be had for important development enterprises."

He warns the public men of the Province, however, that, if capital is to be secured, it must be reasonably sure of protection. "The richest zinc mines in the world lie in the Slocan," he continues, "and by lack of government protection are worthless because of market conditions and the smelting system. As a consequence of this system the Consolidated Mining & Smelting Co. of Canada is the only one that can buy a zinc mine."

Mr. Caldwell concludes:

"Having worked steadily for over two years for a royal commission on smelting, to consist of one member chosen by the mine owners, one by the smelter management and one by the government—a request I do not think ever will be granted unless the Associated Boards of Trade endorse it—I would ask all owners of zinc properties to urge this body to ask such a Commission of the Government. I would draw attention to the fact that the company is paying only 2 cts. a lb. for zinc, and only for the short time that the Sullivan Mine, by reason of the strike, is not producing. Considering the price in the United States market, recently 7 cents at New York, I believe the shipper ought to receive all excess over four cents."

Hon. J. W. de B. Farris, Attorney General of British Columbia, in an address delivered recently at Nelson, B.C., referred to the extensive development of the mineral resources of the Provinces in recent years and enumerated some of the enterprises either under way or planned. In the latter connection he said: "We are told by the manager of the Consolidated Mining & Smelting Co. of Canada that they are about to erect a $1,000,000 concentrator at Rossland or Trail and an even larger one at the Sullivan Mine, Kimberley. We also are told that the West Kootenay Power & Light Company will have to double its capacity immediately almost to carry on. These are only some of the expansions and developments we are hearing about."

Smithers, B.C.

Work has been resumed on the long tunnel at the Babine Bonanza. This will have to be carried 1,000 feet before the vein is struck. It now is in some 300 feet. James Cronin, the owner has been engaged recently in preparing for the continuance of the work engaging men and forwarding the necessary supplies. When the men reached the camp they found it in a chaotic condition. The cook house had been forced by bears, presumably one or more grizzlies, and about one hundred pounds of butter, a similar quantity of bacon and ham had been consumed. Stoves, tables, dishes, and most of the furniture had been thrown about and much damaged. The destructive visitors, however, had decamped. This is not the first time that the camp has been visited during the absence of the owner and his men with the same results.

Lillooet, B.C.

The purchase of the Pioneer Mine situated on Cadwallader Creek, Lillooet, B.C., near the line of the Pacific Great Eastern Ry., for $100,000 by the Mining

Corporation of Canada is announced by W. R. P. Parker, vice-president of that company. The former owners of the property were Adolphus Williams, K.C., of Vancouver, B.C., and the Ferguson Brothers, the latter being the active members of the partnership. The latter have developed the mine and in the course of their operations in the past three years have taken out considerable gold which has been sent to the Dominion Assay Office, Vancouver. With enlarged equipment and the development of new ore bodies the Mining Corporation expects to substantially increase the output.

Mr. Parker intimates that it is not unlikely that his company will extend its operations in this Province, having a profit and loss account of $2,500,000 set apart for the acquisition and the development of new holdings. It is at present assisting in the development of properties in the Barkerville District, Cariboo, B.C., to which reference already has been made

"We have engineers," states Mr Parker, "in South America, Mexico, Manchuria, and other parts of the world and my only regret is that we did not turn our attention to British Columbia earlier."

Princess Royal Island, B.C.

The Belmont Surf Inlet Mines, Ltd., operating one of the largest gold producing properties in British Columbia is reported to be improving working conditions at their camp. A model little town is being built, homes and public buildings, all being equipped with electric light, steam heating, and running water. There is a fine modern club hotel, as well as churches, post office and school. The mine output is shipped to the Tacoma Smelter. Surf Inlet is one of the most prosperous and wealthy mining camps of the north.

Grand Forks, B.C.

An issue developed recently between the Great Northern Ry. Co. and the Granby Consolidated Mining & Smelting Co., Ltd., when the former commenced the removal of steel rails laid between the Granby Company's smelter at Grand Forks and the railway company's main line. It appears that the mining company maintains that as these sidings were constructed at its expense the steel cannot be taken away without its consent. At any rate the work was stopped when the matter was taken up with the authorities. It is understood that the removal of much of the trackage would not materially affect the Granby Company, the smelter being also served by the C.P.R., but one of the sidings which circled the plant and was the shipping outlet for both transportation lines is of first importance, as over these rails, should the smelter not be operated again, the machinery would be carried for use elsewhere. The Great Northern Company is dismantling its branch line to the former mining town of Phoenix. This work was interrupted by a recent heavy snowfall, and it was after this that workmen turned their attention to the smelter sidings.

The International Diamond Drill Company, Spokane, Wn., has a diamond drill outfit in storage at Grand Forks, B.C., the intention being, it is understood, to start drilling on some properties at Franklin Camp in the spring This plant came from the Snowstorm Group, Highland Valley, where the company has been engaged in drilling for the Mine Department of the Provincial Government.

Trail, B.C.

Ore receipts in gross tons for the week from November 7th to the 14th, inclusive, at the Trail Smelter of the Consolidated Mining & Smelting Company of Canada aggregated 5,596, making the total for the year 285,268 tons. The chief independent shippers were as follows: Blue Bell, Riondell, 92 tons; Echo, Silverton, 206; Iron Mask, Kamloops, 160; Josie (Le Roi) Rossland, 266; Mandy, Le Pas, Manitoba, 153; Mountain Chief, Renata, 145; North Star, Kimberley, 467; Providence, Greenwood, 29; Rambler-Cariboo, Rambler, 194; Ruth, Cedar Creek, 167; Standard, Silverton, 558; and Whitewater, Ratallack, 63. Of the company's properties the largest shippers were the Centre Star, Rossland, with 1,336 tons and the Emma, Eholt, with 1,307 tons. The Sullivan Mine still nis not producing.

Vancouver, B.C.

H. E. Bodine, well known in this province as a mining engineer and prospector, has returned from a trip into Alaska with the United States Geological Survey. He reports that one of the principal members of the party, S. R. Crapps, feel over a cliff and broke both arms and both legs. He was carried out to Anchorage and is recovering. The party were inland on July 23rd and were out for 56 days, on 48 of which it rained.

"The most remarkable feature of the landscape is the magnificent peak of Mount McKinley, said Mr. Bodine. "The story of Dr. Cook, the Arctic explorer, that he had climbed it is undoubtedly a fake, and it is at least 30 miles from the foot of the range to the top of the peak, and it is all more or less like the side of a house.

"From a geological standpoint the extraordinary 'Blue Lead' on the western slope of the Alaska range is the outstanding feature. It is a narrow fissure from three feet to thirty feet wide, extending for over 30 miles. Beneath are a few feet of glacial drift of a character not found anywhere else in the world. It is a conglomerate rock which disintegrates on exposure to the air. This mixture is made up not only of the round pebbles usually found, but of sharp-edged pieces which apparently have never been exposed to the action of water or to contact with each other.

"Along this 'Blue Lead' at various points hydraulic plants have been installed."

Mr. Bodine is leaving shortly for the Lardo District, British Columbia, to undertake the superintendence of the Beatrice, a silver lead mine owned by the New Era Mines, Ltd.

Talc and Soapstone

By Raymond B. Ladoo, U.S. Bureau of Mines, by Permission of the Director.

Word Resources of Talc and Soapstone.

Talc and soapstone together with pyrophyllite (usually sold as talc) are very widely distributed over the earth. Deposits are known in nearly every country but the production on a commercial scale has largely been confined to the countries of highest industrial development. Thus the United States produces about 65 per cent, France, 13.4 per cent; Italy, 7.4 per cent; Germany and Austria, 5.4 per cent, and Canada 4.7 per cent. Since soapstone, used in slabs and fabricated articles, such as sinks and tubs, is produced in important quantities only in this country, this discussion will be largely confined to various grades of ground and massive talc. It should be noted, however, that the aborigines in this country and the natives of many other countries, such as India, and Brazil, made use of, and still make use of massive soapstone in the manufacture of pots and kettles.

While the most valuable grade of ground talc is that used for toilet purposes, by far the largest production is of the lower grades, used in the manufacture of paper, rubber, paint, prepared roofing, and other industrial uses. Since the lower grades of talc will not stand high transportation charges, it follows that the greatest production will come from the countries and districts which have best developed the industrial uses. In the United States, Germany, and Austria, many uses have been found for the lower grades of talc. In France and Italy the principal product shipped is high grade talc for toilet purposes and massive tale for the manufacture of lava, but some use is made of the lower grades. In most of the other producing countries there is little or no market for anything but the highest grades. Thus India, Brazil, Japan and Spain, with many known deposits, produce only small quantities. The accompanying table indicates the approximate distribution of production:

World's Production of Talc and Soapstone.

(In 2000 lb. tons.)

Country	1911	1912	1913	1916	1917	Per cent of total
U.S. (a)	143,551	159,270	175,883	212,961	218,848	65.0
France (b) ...	44,092	60,629	66,332	.....	45,000*	13.4
Italy (c)	15,600	15,800	23,530	28,586	25,000*	7.4
Canada (c) ..	7,300	8,270	12,250	13,104	15,803	4.7
Austria (c) ..	15,212	.....	.....	.....	15,000*	4.4
Norway (c) ..	.....	885	1,653	6,063	6,000*	1.8
Spain (d) ...	6,226	.....	.....	1,062	5,000*	1.5

India (c)	689	882	1,350	1,010	1,900	0.6
British So. Africa (c) ...	.....	.....	.....	132	785	0.2
Totals					336,836	100.0

* Statistics unavailable. Figures represent producing capacity estimated for obtaining approximate world production.

(a) Talc and soapstone.

(b) Talc, soapstone and asbestos.

(c) Talc.

(d) Soapstone.

The United States.

The production of talc in the United States in 1917 was divided as follows:*

State.	Short tons.	Value.	Average price per ton.
Vermont	93,960	$625,150	$6.65
New York	74,671	881,462	11.80
Virginia	6,432	85,856	13.35
California	4,152	74,000	17.82
Georgia	3,819	94,314	24.70
North Carolina	2,175	41,766	19.20
Maryland, Mass., New Jersey, and Pa.....	13,404	87,124	6.50
Totals	198,613	1,889,672	$9.51

The entire production of soapstone in 1917, 20,235 tons, came from Virginia.

Detailed descriptions of the deposits in the different States have been given by J. S. Diller in Mineral Resources, U.S. Geological Survey, 1917, and previous years and need not be repeated here. It is of interest to note, however, that the greatest production is centered in New York and Vermont, and that California is becoming an important producer of high grade talc. Vermont has the largest reserves, clearly blocked out, of all producing States.

France.

The most important producing properties in France are in the Department of Ariège. Important deposits are at Montferrier, in the Pyrénées, about 12 miles from the Spanish line, and at Luzech. Another producing district is at Luzenac, near the port of Cette. Eighty-five per cent of the production comes from the Department of Ariège. French or tailors' chalk is produced principally in the Dept. of Gard. Other districts in which talc and soapstone are mined are in the following departments, named in order of importance: Pyrénées-Orientales, Isère, Ande, Savoie, Loire (Haute), and the Island of Corsica. Immediately before the war the production of talc was rapidly increasing, but the scarcity of labor during the war made the production almost negligible. It is probable that the mining will soon be resumed on its former scale.

Italy.

The highest grade talcs in the world are mined in Italy. Their superior color, freedom from grit and impurities and fineness of grain make them especially suited for toilet and medicinal uses and for lava blanks. The main producing district is in the Italian Alps in the neighborhood of Perosa, south of Turin, in the Vallee di Chisone. It is also mined near Pinerolo and in the valleys of San Murtino, Susa and Lanzo.

Canada.

Canadian talcs generally command a slightly higher price than those of the eastern United States, some being suitable for certain grades of toilet powder, but most are used in the industries which demand a medium high grade talc. The principal production comes from a group of mines near Madoc, Hastings Co., Ontario. Several small mines have been operated in

* U.S. Geological Survey, Mineral Resources, 1917.

Brome, Megantic, Montmorency, and Wolfe Counties, Quebec, and in Cariboo Co., and a few other localities in British Columbia. The production of the Madoc district has been rapidly increasing and probably will be an increasingly important factor.

Austria-Hungary.

Austria before the war produced a tonnage equivalent to about 4.4 per cent of the present world production of talc and soapstone. The principal deposits of talc in Austria are in the Province of Styria in the communes of Mautern, Aflenz, Anger, Pollau, St. Kathrein, and Floing. Other producing districts are in Salzburg, Grusserhof and Rohonez, Hungary. The talc is of a high grade but not equal to that from Italy. Much of the Austrian talc was used in Germany for paper making. Austrian producers before the war were keenly alive to the possibilities of utilization of talc and formed an association which published results of research and notes on many new uses.

Spain.

Talc production of Spain is small and comes principally from the Province of Gerona in the Pyrénées, but one mine is reported in the Province of Malaga.

Germany.

Important talc deposits are reported at Gopfersgrun, near Wunsiedel, in the Fichtelgebirge, Bavaria, from which most of the German production came before the war.

India.

Massive talc of excellent quality has been mined in India for years, the natives making use of it for pots and kettles, but export trade has become of importance due to the particular suitability of Indian talc for lava manufacture. The largest production at present comes from the Jabalpur district in the Central Provinces. Other producing districts are in the Provinces of Madras, Rajputna, Mysore, Bengal, Burma, Bombay, and Central India. Veins are usually thin but of high grade. Resources are said to be large.

British South Africa.

Talc is found in Natal and Rhodesia, but the most important production comes from the Barberton district in the Transvaal. Large bodies of more or less pure talc occur both in Rhodesia and Transvaal. In the Barberton district pencils, tailors' chalk, billiard chalk, and ground talc are produced. An important industry sprung up during the war and practically all local needs were supplied. It is stated that a large export trade is looked for when shipping becomes normal.

Brazil.

While no export trade in talc or soapstone is reported, Brazil promises to be a future source of importance. A very pure white talc is reported at Rezende, State of Rio de Janeiro. Deposits at Lorena and Santo Amaro, both in the State of Sao Paulo are also being worked. Good grades of massive talc, at present worked only by natives for local uses, occur near Itaberaba, Bahia; Municipio de Ouro Preto; Varzea near Dores de Boa Esperanca; near Jacuhy in western Minas Geraes; and in the State of Ceara, and Goyaz.

China.

Massive talc or high grade soapstone has been mined for years in China, for the manufacture of carved utensils, images and ornaments. Much of the material, while ideal for carving, is too highly colored for ground talc. The principal district has been the Tsintien region, Chekiang province, about 42 miles from Wenchow. It is also found in the Provinces of Chihli and Fukien.

Norway.

Talc and soapstone both occur in Norway. Soapstone from Gudbrandsdal is used in the Cathedral of Trondhjems. Mills for the grinding of local talcs have been erected at the Songefjord, north of Bergen and in Cistesto, Vikor, south of Bergen. In 1912-14 the entire production came from Froastad, Isteso, and Hardanger in the S. Bergenhus province, and in 1916 from N. Bergenhus.

Japan.

Both talc and pyrophyllite are found in Japan in the Provinces of Hitachi, Kozuke, Musachi, Omi, Bizen, Suo, Hizen, Higo, Harima, Bingo and Aki. Small imports of Japanese talc have been received in this country, and it is probable that Japan is a potential source of some importance.

British Isles.

While the mining of talc and soapstone is not of importance today in the British Isles, several deposits are known and have been worked. Among these may be mentioned the Lizard district in Cornwall; Crohy Head and Gartan near Letterkenny in County Donegal, Ireland; the Shetland Isles, the Hebridges (Harris), and Shiness in Sutherland.

Philippines.

Several deposits of high grade fibrous talc are known in Illocos Norte. From tests and analyses this talc seems to be of excellent quality for paper filling and may become an important source in the future.

Talc of a grade suitable for paper, etc., is reported as occuring near Heathcote, Australia. Deposits of talc of various grades occur in French South Africa, Jamaica, Sweden, the Netherlands, and Belgium from which countries small imports into the United States have been received. Talc of excellent quality but in small quantities comes from Syria, Mexico, New Zealand, and in fact almost every country possesses some resources of talc or soapstone.

Accurate data upon reserves is very difficult to obtain, but it is probable, from the wide distribution of known, but at present unworked deposits, that there are ample supplies for years to come. Probably the United States will continue to lead in production, but the western States will doubtless become of increasing importance. Deposits are now being worked in California and Washington and many other occurences have been noted in the Coast Range, the Sierra Nevadas and in the Rockies. Our position in this field thus seems secure.

A Summer Road to Rice Lake.

It is said that the Manitoba government is favorably disposed towards the proposals to build a summer road to Rice Lake and that surveyors will soon be at work looking over the various routes. There is considerable difference of opinion as to the most suitable route. The present winter road from Fort Alexander crosses much muskeg and would not be suitable in summer. Alternative routes are up the river from Black River settlement or along the sand ridges from Manigotogan. Another route would be from Lac du Bonnet to Long Lake and thence to Rice Lake.

MANITOBA CORRESPONDENCE.

Pan Extension.

Plans for the development of the Pan Extension property, which adjoins the Gold Pan mine, call for the erection this winter of bunk house, boiler house, cook house and smaller buildings. There will be purchased a small hoist, a 3 drill air compressor, boiler engines and pumps.

In 1917 some work was done on property under the superintendence of Mr. Reahill. A shaft was sunk to a depth of 50 feet. The vein is 4½ to 5 feet wide and Mr. Reahill says that good ore was encountered to the bottom of the shaft. This shaft is about 300 feet from the 260 ft. shaft on the Gold Pan. The company owns two claims, one adjoining Gold Pan on the west is known as the Gold Pan Fraction. The second claim, known as the Sunlight, is a short distance east of the Gold Pan. Mr. John Beckman is secretary of the company.

Prospectors' Classes at University of Manitoba.

Instruction in mineralogy is now being given two evenings each week at the University of Manitoba by Professor J. S. DeLury. These classes are open to anyone who wishes to obtain an elementary knowledge of the science of ore deposits.

Bruce Consolidated.

The Bruce Consolidated mining company, which will develop properties in the Rice Lake district this winter, owns the September Morn, Bruce, Brucehor, Bruce Fraction, Mina and Canada claims. These were located by J. J. Papineau, who located the Moose claim. The properties have been reported upon favorably by Professor J. S. DeLury.

Steel Map of Rice Lake Gold Districts.

The accompanying sketch map shows the location of a number of gold properties in the vicinity of Gold Lake and Long Lake. Chief activity during the past summer has been at the Brooklyn mine at Gold Lake. Other properties in the immediate vicinity of the Brooklyn will be developed this winter.

The map shows the routes to the camp from Lake Winnipeg. The summer route is up the Manigotogan river and across Clearwater lake to the Gold Pan property. The winter road from Fort Alexander is shown in dotted line. At the 23 mile post where it crosses Black River, there is a claim used as a stopping place. The winter road from Manigotogan is also shown. This is shorter, but to use it necessitates the crossing of Lake Winnipeg. Fort Alexander can be reached by a 14 mile winter road from the Canadian National railroad. The all land route is however not yet in good shape for travel, as there is little frost in the ground and the snow is already deep. Those who have travelled from the mine during the past few weeks have used dog teams. One party came down the Fort Alexander road to the Black river, then down the river to Lake Winnipeg and crossed on the ice to mile 69—near Victoria Beach on the C. N. R. Another party from the Brooklyn followed the Hole river down to the lake and then walked down the shore of lake Winnipeg. It is expected that the winter road will be soon in condition for travelling by horses from the railway via Fort Alexander.

Eastern Mining and Milling Co.

Good results are being obtained at the copper mine of the Eastern Mining and Milling Co., at Eastman. Quebec. Preparations are being made to mine the ore at the 80, 130, and 260 feet. levels. The new plant for the mill is now on the property and two of the three Hardinge mills are now installed. When the three mills are in operation the capacity of the plant will be about 250 tons per day.

The company uses the oil flotation process and ships the concentrate to the United States. Investigations are under way which it is hoped will result in the refining of the concentrates on the property. The preliminary experiments indicate that an economical process of refining will be found and it is not unlikely that an electrolytic copper refinery will be built at the mine. Mr. F. M. Connell of Toronto is president and general manager of the company which is operating the mine at Eastman, Quebec.

FORWARD TENDENCY IN ENGINEERING.

General Mitchell addresses first meeting of season of American Society of Mechanical Engineers, Ontario Section, at Toronto.

The American Society of Mechanical Engineers, Ontario Section, held their first meeting for the season on the evening of Nov. 14th in Toronto. The gathering took the form of a dinner at the Engineers' Club, following which General C. H. Mitchell, C.B., C.M.G., D.S.O., spoke on some phases of mechanical engineering in the war, which had come under his observation in France and Italy. General Mitchell, who went over with the First Contingent in 1914 as Intelligence Officer, served with great distinction, first in France and then as Intelligence Officer on the general staff of the British expedition sent to the aid of the Italians on the Piave. His address covered transportation matters and mobile shops and other engineering features of the advanced areas in France. He made some very interesting observations on the Italian Hydro Electric developments as he found them at the end of the war in comparison with their condition and size at the time of a previous trip in 1906. He gave a vivid description of the Italian engineering feats in the construction of the "Teleferrica", or wire cable-ways, which transported men and munitions in hanging carriers over mountain peaks and across great chasms, even when subject to a great hazard due to shell fire.

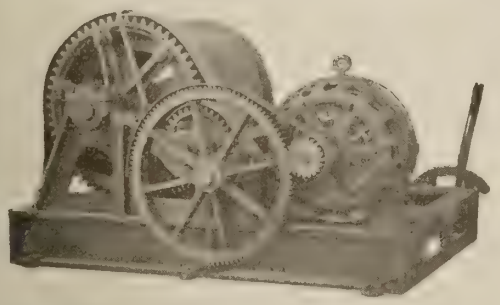
General Mitchell, who is the new Dean of Engineering, as well as an old graduate of the Faculty of Applied Science, University of Toronto, closed with a description of after-the-war conditions at the University and drew some deductions as to the trend of engineering opportunities in different channels, as indicated by the tendency of certain branches, notably mechanical engineering and engineering chemistry, to push ahead at the present time.

After the General's address the meeting proceeded to discuss plans for the season's work and the program of one meeting per month, alternately with a dinner with an address and a technical session, was decided upon. A large number of prospective members were present and all mechanical engineers of the district are invited to participate in these meetings, with the hope that they will ultimately join. It is felt that when members come from as far away as Chatham, London and Belleville to attend, there is little excuse for local engineers failing to identify themselves with the parent organization of this branch of engineering.

Mr. James McEvoy who recently returned from a trip to the Belcher Islands, where he examined iron ore deposits, has taken office quarters in Yonge Street Arcade, Toronto.

A MARSH HOIST

INSTALLED AT YOUR MINE WILL MEAN—



ELECTRIC HOISTS—Made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears and extended base to receive the motor.

Safety for your men.

Speed and Economy in the movement of your ores.

Continuous Operation, through freedom from premature repairs or breakdowns.

Satisfied Labor, in so far as a safe and dependable Hoist can add to their satisfaction, through the feeling of security it engenders.

Would you like a copy of our new Catalogue of Mine Hoists, Cars, Cages and Buckets?

Either Steam or Electric Mine Hoists made in 7 sizes, from 10 to 50 horse power

MARSH ENGINEERING WORKS, Limited

BUYERS OF CANADIAN MINERALS, METALS, ALLOYS, METALLIC RESIDUES
COBALT ORE, OXIDE, RESIDUES, NICKEL ORE, OXIDE, ETC.
MOLYBDENITE, WOLFRAM, SCHEELITE, MANGANESE ORE, CHROME ORE, CORUNDUM, GRAPHITE
METALS & ALLOYS
COBALT, TUNGSTEN, MOLYBDENUM, NICKEL, ALUMINIUM, FERRO - SILICON, FERRO - CHROME, ETC
ASBESTOS—CRUDE, FIBRES, SHINGLE STOCK.

MINING EQUIPMENT

For Immediate Delivery

"Sullivan" Rock Drills.
"Sullivan" Column Bar Drills.
"Sullivan" Tripods.
"Sullivan" Spare Parts.
"Ward" Drill Sharpener (takes 20 ft. steels).
"Hardy" Drills (Simplex Type).
Hexagon Hollow Drill Steel, 1 inch x 14 feet (48 lengths).
Hexagon Hollow Drill Steel, 1 inch x 20 feet (124 lengths).
Hexagon Hollow Drill Steel, 1 inch x 8 feet 6 inches (51 lengths).
"Cameron" Pumps, 24 various sizes (No. 1A, 4A, 9, 5B).
Also Steam Hoists, Derricks, 10-ton Chain Blocks, etc.

This equipment has been in use in connection with construction at Mount Royal Tunnel, and is offered for sale cheap.

For full particulars and detailed list apply to

411 Dorchester St. West
MONTREAL

Let Us Send You A Sample

We might tell you about I.T.P. Lamps for ten years without convincing you of their good qualities—proof has to come in your own mind by actual use, and to make this proof—without risk to you—let us send you a lamp,—with the understanding that it must give you 30 days of entire satisfaction before you pay for it.

TRY THIS LAMP FOR A FULL MONTH AT OUR EXPENSE

Dewar Mfg. Co., Inc.
Dew-ar
190 Wellington St. West
TORONTO, Ontario

WANTED—A competent man with experience covering the principal departments of electrolytic copper refining. Must be prepared to go to Europe if necessary. State terms in application, also experience in design construction and operation, giving references. Mark envelope "Application" and address to W. J. Forrester, Imperial Bank Chambers, Leader Lane, Toronto.

WANTED.

CHEMIST, American, desires position. Several years experience in blast-furnace work, besides steel, ores, electrolytical processes, food products, etc. Best of references. Box 3, Canadian Mining Journal, Garden City Press, Ste. Anne de Bellevue, P.Q.

WANTED
Oil Geologist for Work in Trinidad
Apply:
J. B. TYRRELL, 534 Confederation Life Building
TORONTO

:-: EDITORIAL :-:

AN UNJUSTIFIED ASSUMPTION.

One of the Toronto dailies has made a surprising discovery, to wit, that the article by Mr. Burns which recently appeared in the "Journal" advocating the electrification of the Canadian National Railway in the Maritime Provinces was inspired by the "coal barons" of Nova Scotia, and makes this statement: "The mine-"owners have inspired a campaign for the electrifica-"tion of the National Railways between Sydney, Hali-"fax, and Montreal, with the Halifax-Moncton mileage "for first choice." Torontonian perspicuity could scarcely go further. In detecting in Mr. Burns the spokesman of the "coal barons" of Nova Scotia, and in an editorial discussion of the merits of railway electrification a covert proposal to "nationalize Joggins," this Toronto paper achieves the feat of seeing something that is not there, and, moreover, betrays much ignorance of many things.

This same newspaper indulges in much laudation of Mr. Hanna, the President of the C. N. Railways, because of the manner in which he treated the coal operators of Nova Scotia, intimating that they were asking profiteering prices for their coal. As a proof of the proficiency of the C. N. R. Board in handling coal operators as they should be handled, it is said Mr. Hanna, sent down expert accountants to Nova Scotia to inspect the books of the coal companies, a procedure which this Toronto paper elegantly explains "got the goat" of the coal operators. It is not stated, however, that these same accountants found the statements of the coal operators to be accurate and in no way overstated.

It appears also to be believed in Toronto, if the newspaper referred to correctly expresses itself, that the high price of coal in Nova Scotia is an act of the coal companies, who are unduly profiting thereby. This assumption is as incorrect and as fantastical as the suggested aim of "nationalizing Joggins."

The causes of the high cost of coal in Nova Scotia are well known. They include a one hundred per cent increase in wages to the mineworkers, a forty per cent decrease in production, and increases in the costs of mine supplies such as pit-timber, brattice cloth, rails, metals, explosives, oils, horse-feed, wire-ropes, electrical supplies, and taxation which are a matter of common knowledge and widespread application.

The rivalry between Toronto and Montreal has many entertaining facets, but it is not good for Canada that the President of its national railways, or a thoughtful article such as that of our contributor, written, as we know, without ulterior motive, and the well being of a national industry, should be dragged into a purposeless discussion which has its real origin in the railway strategy of rival cities.

It may also be pointed out that the gravamen of our argument was that the Maritime Provinces were undeveloped because of the inadequate transportation facilities on land; that "the coal mined in Nova Scotia has "for generations gone to provide the driving power for "the industries of New England, Quebec and Ontario, "and has, in large part, been followed by the youth and "energy of the Province." The remedy proposed was the generation of moderately-priced electrical energy at the coal-pit mouth, and the associated development of transportation lines and local manufacturing industries based on relatively cheap power costs.

These reasons are admitted to be good, but, states this Toronto paper, "we are a little suspicious of advice that comes from the 'barons' ' quarter." No one, we imagine, will be more amused at this sapient conjecture than the aforesaid "barons."

The irresponsible nature of the Toronto comment referred to is clearly shown by a later editorial in the same newspaper, which states: "The steam locomotive "is a wasteful machine. In hauling a train of coal "across the continent it consumes one-third of the cargo "in making a round trip. We must as far as possible electrify our national railway system." Precisely so.

THE C.M.I. INSTITUTE MEETING AT VANCOUVER.

The Vancouver Meeting was well attended. The papers read were excellent, inasmuch as they told of new mineral discoveries, new and immensely improved coal mining plants and colliery housing, new processes in metallurgy, new movements amongst technical men, and potential industries in what is yet but a new country. Reasoned optimism characterized all the papers and enlivened the discussions.

Are not these things all outward signs of the inherent strength of the western branches of the Canadian Mining Institute, and the vigor of the industry the western members direct?

The "Journal" especially desires to congratulate the Vancouver newspapers on the accurate and understanding publicity given to the proceedings of the meeting, which is in favorable contract to the scant space devoted to the proceedings of the Institute on the occasion of its annual meetings in the cities of the East.

The Canadian Mining Institute in Annual Meeting at Vancouver, B.C.

26th to 29th November 1919.

Three hundred members of the Canadian Mining Institute assembled at the Vancouver Hotel on the 26th November to take part in an unusual event, a meeting of Institute members in annual general gathering in British Columbia. The meeting was as unqualifiedly successful as it was unusual, and promised that future Western Annual General Meetings of the Institute will be equally as successful as they will become usual.

The members in attendance were naturally chiefly from British Columbia points—which does not necessarily imply that they did not travel far to attend the meeting—but there was a fair representation from the Alberta branches, and several from Quebec. More would have been present from Alberta, but for the more or less permanent condition of labour trouble in that province. The State of Washington was well represented, following a pleasant custom of western mining gatherings.

The City of Vancouver had previous to the meeting sent out to all members of the Institute an invitation to come to Vancouver, and the formal opening of the business of the meeting was preceded by an address of welcome from Mr. R. H. Gale, the Mayor of Vancouver, who felicitously and correctly welcomed the Institute to a city which was "the industrial capital of one of the richest mining districts in the world."

The chair was taken by Mr. S. S. Fowler of Nelson, in the unavoidable absence of the President of the Institute, who had intended to be present, but was unable to sail from England until the 25th.

Much interest was added to the proceedings by the presence of members of the faculty of the Universities of Washington and British Columbia and by past and present members of the Canadian Geological Survey.

MORNING SESSION, WEDNESDAY, 26 NOV.

The first subject discussed at the morning session of Wednesday was how best to extend the fields of the Institute's usefulness in the West.

Mr. Fowler, the Chairman, deplored the fact that the mining industry of British Columbia was not represented in the manner in which it had been hoped for. He stated that he and two others formed the entire representation of British Columbia mining men from the interior. He appealed for greater interest to be displayed by mining men in their own organization and a more active part to be taken in the conduct of its affairs and the contributions to the proceedings at the branch and general meetings.

Professor Hodges, who is acting secretary of the meeting, said that Canada was entering upon a new era as regards the relationships between the government and the mining industry, between the employer and the employd and between the professional and business interests that direct mining matters. The day had passed he said, when the institute could confine its interests to the technical side of mining. If it is going to continue to be a worth-while organization, it must take a more active part in all public matters as far as they relate to mining. To do this the institute must be representative; it must include employers and employed, the professional man, the miner and the prospector, and all connected in any way with the industry. The institute should enter politics, not as a political party, but as a party representing the mining industry.

It should give its endorsation or express its disapproval of every legislative proposal that affects mining. It must tell the government what the industry wants or does not want, and must be strong enough to speak on behalf of the whole industry. He pointed to conditions in the past when a few of the big mining companies presented their points of view at Ottawa with the result that no consistent representation of the industry as a whole was given. The viewpoint of the industry as a whole should be given by the institute, he contended, and he expressed the opinion that it would be very regrettable if the present meeting adjourned without taking some steps to make this possible.

Considerable discussion ensued, among those taking part being Dean R. W. Brock of the University of B.C., Messrs. Drummond, Lamb, and several others, but resolutions dealing with the matter were deferred for submission to the resolutions committee for consideration at a later session.

Free Importation of Machinery.

The resolution to be submitted to the meeting regarding the free importation of mining machinery was framed by a special committee appointed some time ago by the Institute to consider the matter. Mr. Louis Simpson of Ottawa prepared a paper on the subject, giving the reasons for the resolution which had been prepared, which calls for the importation into Canada of all machinery used in a basic industry, imported by the user, free from duty or war tax unless such machinery be placed on a list to be compiled by the Minister of Finance after hearing evidence on the matter and given free opportunity for representations from interested parties, this list not to include any machinery not made in Canada of the capacity stated, or equal quality to that hitherto imported and being offered for sale in this country at reasonable cost.

The resolution was presented by Mr. E. E. Campbell of Anyox, a member of the special committee, who stated that Mr. Simpson has informed him that the resolution would be endorsed by the tariff committee of the Manufacturers' Association of Canada. The resolution will come up for discussion at a later session of the meeting after passing through the hands of the resolution committee.

Returned Soldier Inspectors.

Mr. S. S. Fowler in introducing the subject of the employment of returned soldiers by the government in prospecting certain areas of the Dominion, said that the proposal was one of the greatest importance for the future of the mining industry in Canada and would be of peculiar value as regards certain areas such as the northeastern portion of this province. He pointed out that the race of prospectors was disappearing owing to the decreasing speculation in mining claims, which made the prospector's reward so precarious that he was not content to engage in an arduous occupation in the hope of little return beyond the grub stake, and

that there were fewer who would now speculate to the extent necessary to outfit prospectors.

He described the action that had already been taken. A plan whereby bodies of prospectors, all returned soldiers, would be sent out under the guidance of experienced geologists, the men to be paid by the government and to be given in addition a share of the proceeds from any finds which they may make in the areas to be approved by the department of mines, had been proposed to the government. On the grounds that it savored of class legislation the government had turned down the proposal, although it had been supported by a number of other influential bodies and had been endorsed by the Institute of Civil Engineers and the G. W. V. A., besides a number of boards of trade. It was intended now to re-introduce the proposal by way of approaching individual members of parliament in order to secure its appearance in concrete shape at the next session of parliament.

Professor Wallace introduced a resolution expressing the renewed endorsation of the plan by the Canadian Mining Institute and the opinion that immediate steps should be taken in order that the plan may be put in force early next year. The speaker pointed out that in view of the government's contention that this was class legislation the question of the land settlement scheme immediately arose. Mining was the next greatest industry in the Dominion to agriculture.

Mr. Fleet Robertson of Victoria said that he had been in communication with Gen. Leckie, who was very anxious to see the scheme again put forward, both on behalf of the returned men and on behalf of the mining development of the Dominion.

Mr. Sloan Will Help Scheme.

Mr. Nicol Thompson, chairman of the Mining Bureau of the Vancouver Board of Trade, said that that body had approached both the Provincial and Dominion governments on the matter. The Federal Government had informed them that they had already refused to take up the matter, but the Hon. Mr. Sloan had promised that the scheme should be taken up at the coming session of the provincial legislature with a view to adopting some portion of it for British Columbia.

Dean Brock was of opinion that the instruction suitable for prospectors should form part of the curriculum adopted by the department of Soldiers' Civil Re-Establishment for the education of returned men.

The remainder of the opening session of the convention was concerned with matters of membership and organization of the institute, a general desire being expressed for changes which will enlarge the basis of the institute and result in greater interest being taken in its meetings and deliberations.

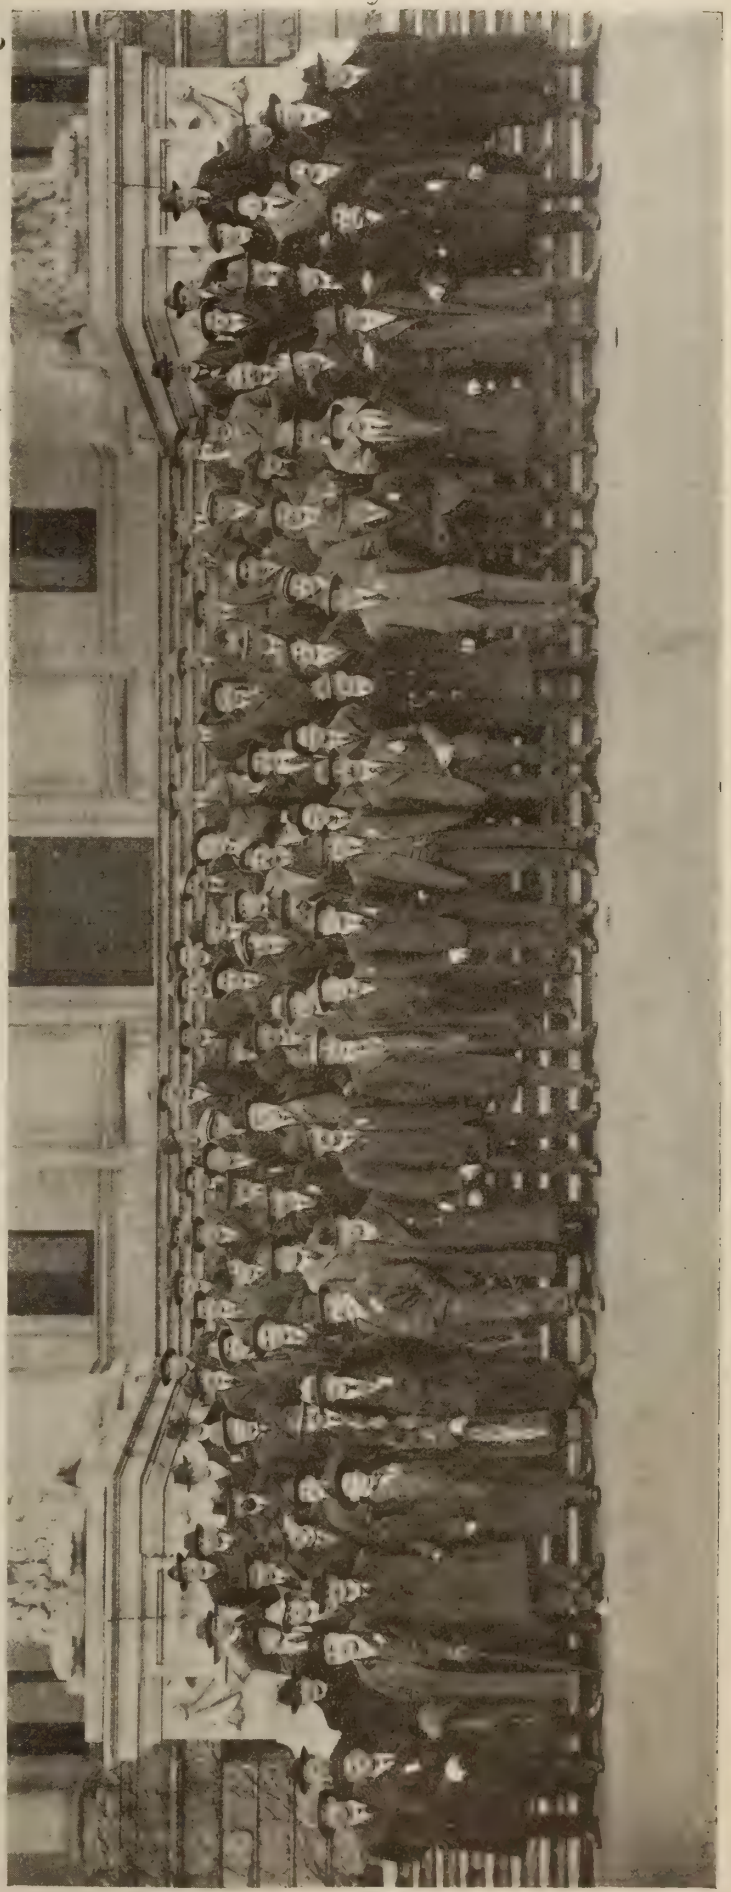
AFTERNOON SESSION, WEDNESDAY, 26th

Mr. O. E. S. Whiteside's paper on "The Future of Coal in Alberta" was not presented, much to the regret of the members, Mr. Whiteside having been prevented from attendance by labor matters.

It is to be hoped that Mr. Whiteside's paper will find its way into the Transactions as the future of coal in Alberta is to a large extent synonymous with the future of Canadian industries.

THE CASSIDY COLLIERY.

Mr. E. G. Wilson, superintendent of the Cassidy Colliery of the Granby Consolidated Mining & Smelting



Members of the Canadian Mining Institute, in attendance at the Vancouver Meeting, 26th-28th November, 1919, photographed on the steps of the Court House.

Company read a paper describing the newly completed plant which is situated inland on the Nanaimo River about eight miles from Nanaimo on Vancouver Island.

A brief description of this remarkable colliery has already appeared in the "Journal" and in a later issue it is hoped to include a detailed description, and photographs of a colliery layout unique in Canada.

Mr. Wilson, it may be here incidentally remarked, represents a third generation of coal miners in Canada. His grandfather sunk the shafts of the "New Winning" of the General Mining Association at Sydney Mines in 1867 and his father, Mr. W. R. Wilson, is General Manager of the Crow's Nest Pass Coal Co.

The notable feature of the Cassidy Colliery is the unusual provision for the comfort of the mine employees. Art has been used to beautify a site that is in itself beautiful and desirable, and after seeing Cassidy Mine, the average colliery official is divided in his mind between admiration at what has been achieved and regret that like provision has not been—and in some places unfortunately cannot be—made.

The Chairman believed that the care for its employees shown by the Granby Co. would, if generally adopted, markedly lower the cost of assessment for workmen's compensation.

Mr. Thomas Graham, General Superintendent of the Canadian Collieries (Dunsmuir) Ltd., said the Granby Company had set a pace for the East that would be hard to follow, a pace that only their large resources had made possible.

Mr. F. W. Gray said that to one coming from the collieries of Nova Scotia—where the mines were very far from being things of beauty—Mr. Wilson's paper had sounded like the Apocalyptic description of the City Beautiful. If, as Mr. Wilson had stated, the Cassidy Mine was the conception of Mr. F. M. Sylvester, the General Manager of the Cassidy plant, that gentleman was to be most heartily congratulated on the manner in which he had created such a practical exemplification of his theory that the mental and physical well-being of workmen is the secret of harmony between employer and employee.

COAL IN THE STATE OF WASHINGTON.

A paper on the "Future of Coal in Washington State" prepared by Mr. H. N. Freeman of Black Diamond, was read by Mr. H. H. Sanderson, of the Mines Safety Appliances Co. The title of this paper would appear to be a misnomer, it being chiefly descriptive of accepted methods used in mining and prospecting coal seams.

The Chairman asked Prof. Joseph Daniels of the University of Washington, to speak on the coal occurrences of that State, and at very short notice Mr. Daniels gave an incisive but quite comprehensive account of the known coal resources of Washington and of the unusually difficult and costly conditions attendant upon coal mining there.

The coal deposits extend from the International Boundary to the Cascade Mountains of Oregon, and are of Eocene age. The coal varies from sub-bituminous to anthracite. The term lignite as applied to Washington coals is probably erroneous. They contain a low percentage of moisture and do not disintegrate rapidly. They are not strictly to be classed with the lignites of the plains and the western provinces. The coal becomes more anthracitic as it approaches the Cascades. Its coking properties are apparently the result of metamorphism, and the anthracitic characteristics are presumably the result of extreme metamorphism.

Prospecting is difficult. The seams are hidden under a mantle of glacial drift and thick forest cover. Steep dips and faults and igneous intrusions make difficult problems in mining and development.

Most properties have been so far opened from water-level drifts where the seams have been exposed by watercourses, and there are but two shaft mines in the State. So far no deep mining has been carried on.

Retreating longwall has been used successfully, but in the main longwall has not been successful, because of the disturbed character of the seams. For the same reason the introduction of coal-cutting machinery has not made progress. Hand mining and shooting out of the solid are usual practice. Costs are naturally high—the highest of any State in the Union—because of the combination of physical difficulties and initial high wages.

The coal seams are dirty and the coal must be cleaned outside the mine. Practically all coal mined must be wasted. The percentage of wasted coal is larger than anywhere else. The lump coal percentage is small, and fines predominate. Annual output of the State is about 3¼ million tons.

B. C. Coal a Favourite Fuel.

Prof. Daniels referred to the appearance of head lines in the Seattle papers when announcing the arrival of Vancouver Island coal cargoes, and said the success of B.C. coal in the Washington market was due to its fine physical appearance.

Use of Pulverized Coal.

The meeting was especially interested in Prof. Daniel's remarks on the use of pulverized coal in Washington because of its bearing upon the similar problem of the use of pulverized lignites in the prairie provinces of Canada.

The Pacific Coast Coal Company of Seattle is now delivering pulverized coal in truck-load lots to consumers, which solves the problem of the user of pulverized coal who does not wish (or cannot afford) to install a pulverizing plant.

Automatic Under-Feed Stoker for Domestic Heating.

Another interesting statement made by Prof. Daniels was that under-feed stokers, with electrically-operated automatic feed—controlled by thermostat device—were being successfully tried out on the Pacific Coast for heating houses and buildings.

OIL POSSIBILITIES IN THE WEST.

Mr. D. B. Dowling, the Director of the Geological Survey, was listed on the programme to speak regarding "Oil Possibilities in Western Canada," but his address was much more comprehensive in its scope than the title promised, being, in fact, a lucid explanation of the geological history and present condition of the oil-bearing rocks of North America, which he said occurred in two well-defined horizons, one in the older rocks and one in rocks of Tertiary age. Mr. Dowling illustrated his remarks by lantern slides, which included some fine reproductions of relief maps.

"Crystalline rocks and sediments older than the oil formations constitute a large part of the sub-surface of Canada," said Mr. Dowling. He pointed out that the promising areas may be defined as including the less distributed strata lying between the Cordilleras and the Apallachians in the United States while beds not affected by ancient folding are found in the Tertiary beds in California. In the fractured zone of

the Atlantic Coast small areas of intense deformation are found that give a small measure of promise as possible oil fields but also suggest that the possibility of porous beds may have been lost.

"In New Brunswick and Nova Scotia oil shales and cannel coals occur that give promise of great value as oil producers," said the speaker, as he illustrated the territory by means of lantern slides. The Western Peninsula of Ontario has long been the principal producing oil field of Canada, but while the production is slowly decreasing, a close study of the underlying strata has suggested an expansion of the field. The region west of the lakes contains the most potential oil fields and is divided into two areas, the Central basin and the Northern basin.

In the Peace River district heavy oil has been obtained by boring, and in possibly the same measures out-cropping in the Athabaska river, where sands up to 200 feet in thickness are saturated with heavy asphaltic oil. There is also a small area in the southern part of Satkatchewan in which the oil horizon may be reached at elevations approaching or above sea levels. This area is suggested from the discovery in a deep boring in the vicinity of this anticline of heavy oil or asphalt in sands at the same horizon as in the northern field.

Most Promising Oil Reserve is Peace River District.

The most promising oil reserve in Canada was in this part of the Dominion, he said. It might be many years before those northern reserves were utilized, but it was a good thing to know that they were there. When the world's fuel supply began to decrease, Canada would be glad to know that this supply existed, even if it was "in cold storage." As for the problem of transporting it, Mr. Dowling declared this would be solved when the necessity arose.

Speaking of the Calgary field, Mr. Dowling said this area had produced 13,000 barrels of oil last year, which was of a high grade and was valued $100,000.

Oil Occurrences in Rocky Mountains Foothills.

In the distributed foothills confronting the Rocky Mountains narrow folds are frequently found, and these areas are small, but from one that has been prospected by boring, small flows of a very high grade oil have been obtained. Gas, which is derived from the same beds, is found to contain vapors of gasoline, and it is supposed that the accompanying oil is the condensation product.

There was no proof of the existence of strata on the coast here favoring the retention of oil, he said. He doubted if there was anything more than a few seepages. He told of a diamond drill hole having been made near here which went through a formation which would not hold oil. It would be a strange thing if oil was found here in commercial quantities, as there was no indication of there being an oil field here. Men who were trying to raise money for drilling had much to say about it but they kept away from the members of the geological department. That is where they made a mistake, because the members of this department were anxious to help everybody. "Tertiary beds are being examined in the Flathead Valley and at the mouth of the Fraser River. In the southern part of the Rocky Mountains bordering on Alberta seeps of oil, apparently from sediments of the Cambrian age, are being studied with a view to tracing the origin of the oil. Oil shales are found in the Queen Charlotte Islands, but their extent and value has not yet received much consideration. They are suggested as the origin of the oil found in basalts, which cut them."

DEAN BROCK ON THE PALESTINE EXPEDITION.

R. W. Brock, now Dean of the University of British Columbia, and attached to General Allenby's staff as a geologist with the rank of Major, described "Palestine and the Last Crusade" to a large audience in the ballroom of the Hotel Vancouver, in the evening of Wednesday.

Dean Brock was attached to the forces under General Allenby in the capacity of geological adviser. The Germans early in the war recognized the value of expert geological advice to their armies and in the west they employed forty geologists to the two that the English provided. Starting from a slide showing a cross section of Palestine from the coast across the trench of the Jordan Valley to the plateau of Moab, the speaker proceeded by means of a relief map of the country and a number of slides showing the character of the land in its different parts to give his audience an idea of the country over which Allenby had outwitted the German generals opposed to him, while the British forces had outfought the Turkish and German soldiers and brought about the crushing defeat of the enemy in September, 1918, that forced Turkey to her knees.

The lecture consisted of little more than brief explanatory remarks accompanying a remarkable series of photographic slides. These showed the country from the south of Jericho to the extreme north at Damascus. They included the scenes of the big battle when Allenby's cavalry out-flanked the enemy while the infantry, owing partly to the effect of the successful concealment of the plans and preliminary preparations for the advance but chiefly to the endurance and quality of the men who pushed forward eagerly during the intensest days of the hot weather, made the frontal attack that did not flag until Allenby was able to enter Jerusalem in triumph, with the Turkish army completely in his possession, men, transport, artillery and baggage, while another army with its communications cut, menaced by the Arabs in rear and the British on the flank, was endeavoring to extricate what it could from the disaster.

The Valley of Death.

Among the pictures was one of the famous "valley of death" where the retreating Turkish artillery and transport caught in the steeply banked Nablus road was shelled by our airmen until the cutting, which formed the only line of retreat left open, became one hideous shambles of wrecked guns, waggons and lorries, dead and dying men and horses; the spot where the greatest amount of carnage in the whole history of the war is believed to have taken place.

Speaking of the German occupation of Jerusalem, Major Brock told of the use by the Germans of the monastery on Mount Carmel as a fort. There was a monument on the mount in memory of some of Napoleon's soldiers which the Germans destroyed.

A clock tower had been erected at Jerusalem to commemorate the visit of the ex-kaiser. This, he believed, was not there now.

Early in the war the Germans had geologists working in Palestine and archeologists were working at a number of points. One of these Germans, a professor, made complete topographical maps of the entire country. The British had to get along with an old reconnaissance survey made by the late Lord (then Lieut.) Kitchener in 1879.

Searchlight on Tower.

The Germans had a hospice on the Mount of Olives. There was a tower on this in which there was a searchlight. The Germans had hospices at every strategical point in the country, each one similarly equipped, and one of which could contain more tourists than visited Palestine in a year.

Some of the German sisters at the Mount of Olives hospice offered to keep house for the British officers. This was done for some weeks, but the general had found it easier to keep his plans secret by moving.

The Egyptian native troops disappointed the Turks by their attitude. While they not be persuaded to fight the Turks they would not join them, keeping a neutral attitude.

When the enemy evacuated Jerusalem they gave out that they would soon be back. But the populace put more faith in certain prophecies that had been made. One of them was that Jerusalem would not be captured until a prophet came. As the population pronounced the name of Gen. Allenby, it meant, in their tongue "The Prophet." Another prophecy was that the city would not fail until Nile water flowed into it. Nile water flowed in through a British pipe line. The other prophecy was that a wealthy man would be appointed governor. The British appointed General Money governor.

MORNING SESSION, THURSDAY, 27th NOV

On Thursday morning the Chair was taken by Major Angus Davis, of the Dolly Varden Mine.

POSSIBILITIES FOR PLATINUM IN WESTERN CANADA.

Professor W. L. Uglow of the University of British Columbia spoke to the above-mentioned title.

"Platinum still continues to be a very scarce article, and has advanced from the fixed war price to the present one of about $130 per Troy ounce," said Professor Uglow. The largest producer of this precious metal was Russia, where in the Ural mountains the pre-war supply, had been about 300,-

600 ounces a year, but since the war this had greatly decreased. The United States is the second largest producer of this metal, and in 1917 the total output was 32,000 ounces, while Canada was running a close third, but this country had lost a lot of the credit on account of the fact that when the metal is discovered in the blistered copper from the Sudbury mines it is sent to the States, where it is refined.

"Native platinum has been found in various parts of Western Canada, chiefly in the Tulameen district of the Similkameen Mining Division, from which, during the year 1887-1891, an average annual output of 1500 ounces was recorded. It seems, therefore," said Professor Uglow, "on account of the present conditions of the platinum market, on account of our past production and because of the fairly wide distribution of platinum minerals in the west, that increased emphasis should be given to the possibilities of augmenting the Canadian output."

In dealing with the different metals in which platinum was found, the speaker told of a large number, mostly in Russia, Spain and Tasmania and on this continent. He stated that over 99 per cent of the world's supply of the metal was derived from placer deposits, and that all present information pointed to the increase of deposits in this way in the future. He related several instances in British Columbia where platinum had been found associated with dunite, which occurs in gravel and in river beds. In some other cases the presence of platinum has been located in quartz veins around Burnt Basin, B. C. Another method of getting platinum has been discovered recently by treating blistered copper sulphite ores and yet, in spite of the fact that the largest portion of the world's production is derived from placers and of the fact that Western Canada is noted for the occurrences of platiniferous gravels, it is worthy to note that the Canadian production of the metal is at present very largely derived from ores of the lode type.

In conclusion Professor Uglow that in view of the great possibilities there were three lines of attack to develop them. First, attention should be directed to those localities whose geology is similar to that in producing districts; second, the ground should be accurately tested in accordance with approved methods, and third, progress must be made in the matter of facilitating the recovery of platinum from lode ores and auriferous gravels.

He gave at some length the reports of many prominent mining engineers of the province regarding the possibilities, along with a number of figures to show the percentage of platinum that existed in the various ores.

Mr. Charles Camsell mentioned that a considerable platinum content in Sudbury ores was recovered in treatment in the United States which was not fully credited to Canada, and that the figures quoted by Prof. Uglow should actually be greater.

Mr. E. A. Haggen, Editor of the B.C. Mining and Engineering Record spoke of some possibility of recovery of platinum from placer black sands, and on occurrences of palladium.

Mr. Wm. E. Greenawalt's paper on the "Hydrometallurgy of Copper Sulphides" was read in the absence of the author.

Mr. E. P. Mathewson's paper on "Concentration of Copper Ores" was taken as read.

IMPROVEMENTS IN ORE CONCENTRATION AT THE TRAIL SMELTER.

Mr. A. W. Diamond, of the Canadian Consolidated Mining & Smelting Company, read a paper on "Recent Ore-Concentration Developments at Trail":

"The great advancement in the science of ore concentration by the oil flotation process in recent years naturally revives hopes in many cases for the successful treatment of ores by flotation which had formerly proved too refractory to the older gravity concentration methods and to the early undeveloped flotation process," said Mr. Diamond.

As examples of this process he told of the work of his company in developing low-grade gold ores of Rossland and the complex lead-zinc iron ore of Kimberley, B. C.

"During the first year efforts were directed chiefly towards the solution for gold ore and an experimental mill of 250 tons daily capacity was built and equipped with concentration machines which it was known would effect some separation and which it was hoped would successfully solve the treatment," continued the speaker.

Sullivan Ore.

In referring to the Sullivan ore, he explained that it was a finely crystalline complex mixture of lead, iron and zinc sulphides, carrying only three to six per cent insolubles. From a preliminary series of laboratory tests it was discovered that a good separation of zinc could be made from the lead and iron by flotation of the ground ore after it had been roasted at such a temperature as to almost completely oxidize the lead and iron sulphides, but to oxidize only a small percentage of the zinc sulphide. He pointed out that this roasting operation was commercially practicable and had been tested and proved a very valuable asset.

In dealing with the Rossland ores he pointed out that the concentration of the low grade ores had been given a great deal of attention and that they had been converted lately from an oil process into a simple gravity-table mill.

The flotation of the Rossland ores was again investigated by Mr. John Bray at Trail in 1917 with the results indicating that both flotation and cyanidation were necessary similar to those previously obtained at Rossland.

When the Sullivan concentration problem was fairly well solved, concentration of Rossland ores was investigated by the speaker and it was found from laboratory tests that good recoveries were obtained by a combination of flotation and tabling. The ratio of concentration, however, was such as to make the advisability of this treatment questionable.

"It is doubtful," he concluded, "whether this work would have to be continued had it not been for the fact that the original Sullivan experimental flotation mill was available and could fairly easily be adapted to the concentration of these ores. The mill was accordingly arranged with tables and flotation machines so that both, or flotation only, could be used. Before the completion in the changes in the table installation in this plant, operation was commenced with flotation only and from the outset as a high recovery was obtained thus as was obtained with both tables and flotation in the laboratory tests, and at the same time a much higher ratio of concentration was secured than if tables had been used.

"On completion of the table installation tests were made for periods of a few days each, using both treatment, but with no additional recovery and with a much lower concentration radio. Careful study of the flotation condition since that time has resulted in the securing of a still higher ratio of concentration by flotation alone, still maintaining as good or better recovery. Fortunately a mill installation for this treatment will be cheaper and more simple in operation. Plans are now being completed for a 1500-ton concentrator.

At a complimentary luncheon given by the Kiwanis Club to the members of the Institute, address were given by the Chinese Consul and Dr. McCallum of the Advisory Council.

AFTERNOON SESSION, THURS., 27th NOV.

Thursday afternoon's session, with Mr. Chas. Camsell in the chair, was notable for the very large attendance, the novelty and importance of the papers presented, and the keenness with which those present entered into the discussions. It would be hard to improve upon the "snappiness" of this meeting, and this was no fortuitous accident, but the result of much patient organization before the meetings.

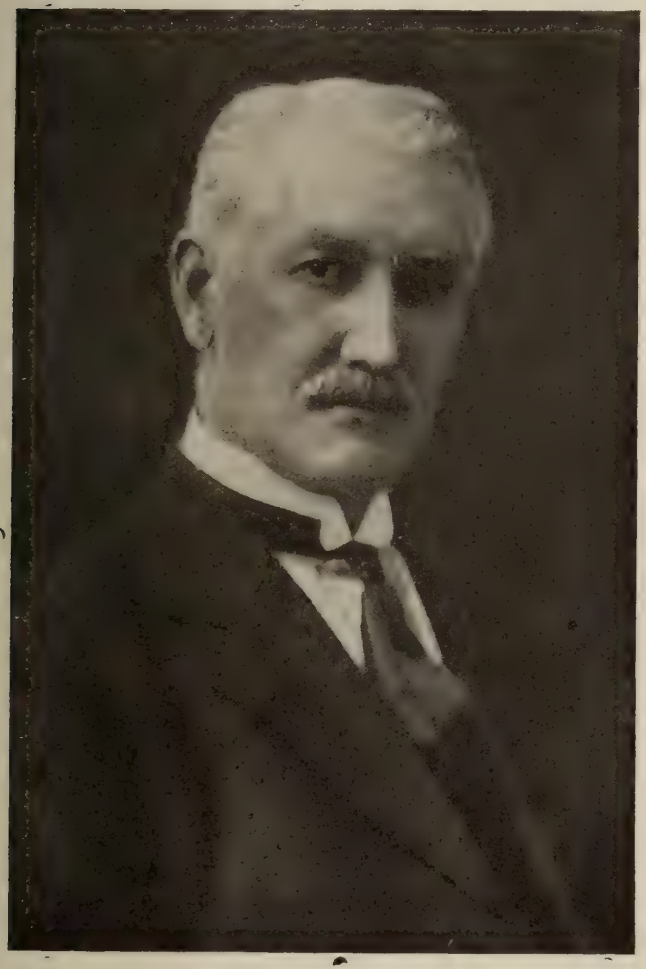
BY-PRODUCT COKE-OVENS AT ANYOX.

Mr. W. A. Williams' paper described the by-product coking plant of the Granby Company at Anyox, a description of which has already appeared in the "Journal." Mr. E. J. Conway read Mr. Williams' paper in his absence.

Mr. F. W. Gray said the Anyox plant was of unusual importance because it was the first large by-product installation on the Pacific slope. The bee-hive oven was rapidly falling into well-advised obsolence, and of much significance was the fact that in 1919, for the first time, the tonnage of by-product oven coke pro-

duced in the United States had exceeded the tonnage of beehive coke. The tendency of coke-oven practice in the East was to reduce the coking time and to lessen the width of the oven-chamber. Typical modern practice was 17 hour coking time and oven-chambers 17 inches or 18 inches wide.

Mr. W. R. Wilson of the Crow's Nest Pass Company, said the Anoyx plant had, of course, lessened the demand for coke from the Crow's Nest Mines. Mr. Wilson did not, however, dilate further on this point, turning his remarks much to the amusement of the meeting upon the beautiful colors of the Indian motive decorations of the "Totem Room" of the Hotel, and the general excellence of the climate and minerals of British Columbia.



MR. D. B. DOWLING.

THE DOLLY VARDEN MINE.

Major Angus Davis described the recent operation of the Dolly Varden Mine, which is located at Kitsault River, 17 miles above the point where it enters Alice Arm. Total shipments of ore from the mine, he said, amounted to about 6,500 tons of ore while the total silver production for this year to November 15 was 340,000 ounces. Shipments started last August and were the first to be made from this district.

The ore bodies were almost certainly of secondary origin. Owing to repeated faulting and cross-fissuring, mining operations had to be carried on with great care. The greatest depth obtained at present was under 300 feet. A lower tunnel was being driven this winter which would give an additional 230 feet. At or near the surface native silver occurred, in some places in extremely rich streaks, and lower down native silver, ruby silver, argentite and stephanite occur. About 270 feet from the surface ruby silver was the principal silver-bearing mineral. Fine-grain pyrites, carrying good silver values, also occurred in ore from the present bottom level up to the surface. Only higher grade ore was being shipped this year, the poorer ore being left always available when milling operations are possible.

THE STEWART DISTRICT.

Mr. E. E. Campbell, Mine Superintendent for the Granby Company at Anyox, gave a description of the Stewart District in Northern British Columbia. Mr. Campbell said in part:

For the past year no part of British Columbia has demanded more interest from a prospective mineral producing standpoint than that tributary to Stewart. About 10 years ago this place was the centre of a noted mining boom, and although at that time several properties of decided merit were found the district was more or less discredited by the foolish exploitation of a few properties of questionable value.

The interest now being taken in mine development in the Stewart district is based on many valuable discoveries of high-grade ore, and these cover such a wide area that the district as a whole cannot fail to be one of first importance.

Only that portion of the Stewart mineral area situated on the Salmon River will be discussed in this paper as it is in this part that many of the recent finds of rich ore have been made.

It has always been the opinion of geologists and engineers that the successful tenure of the mining industry in Northern British Columbia depend upon the development of primary ores of comparatively low metal tenure.

Due to heavy glaciation most of the oxidized portions of the outcropping ore bodies have been removed; the same

MR. THOMAS GRAHAM.

can be said of the surface-enriched zones, as few ore bodies on the north coast, on development, show definite evidence of surface enrichment.

Extensive Ore Bodies of Secondary Origin.

The recent discovery of extensive ore bodies carrying minerals that are unquestionably of secondary origin, establishes a reversal of the conditions thought to exist, as well as a change in the opinion of mining engineers regarding the types of ore to be encountered in the district.

Prospecting for minerals in northern latitudes has never been carried on as enthusiastically as in the districts further south, such as in California, Arizona and Mexico, due to the lack of rich surface ores. In these southern climates no glacial erosion occurred at the time the northern portion of the hemisphere was enveloped in ice which left that area free to the processes of oxidation and subsequent enrichment. This produced many rich surface ores which were eagerly sought for by the prospector, and when found could easily be turned to his credit.

The northern prospector generally had low-grade ore to deal with, the development of which usually entailed much capital, unless specially favored by location or other physical advantages.

The discovery of rich surface ores in the Stewart district has so stimulated prospecting that the final results to the prospector, mine operator, and the province should be manifold, and such discoveries should be an incentive to the further examination of other districts and the uncovering of new ore bodies

Edge of the Batholith Offers Greatest Promise.

A large part of the Coast range of British Columbia and the adjacent portion of Southeastern Alaska, is made up of granitoid rocks. These vast bodies of granite enclose, or are adjacent to, many scattered areas of sedimentary and numerous types of igneous rocks, and it is these areas flanking the granite mass that afford the greatest promise of reward to systematic prospecting. The Stewart mineral showings occur in one of these areas adjacent to the granite.

For the first five miles up the Salmon River from where it empties into the Portland Canal the country rock consists of granite. In contact with this is highly altered schist of apparently sedimentary origin. Beyond this is a vast area underloin by greenstone and tuffs, and it is in these rocks that the recent ore discoveries have been made. The greenstone, which is essentially a quartz porphyry, has been sheared and silicified in places, and it is in such zones that the ore occurs.

The greenstone in places is overlain by a volcanic brecchia, varying in texture from fine to coarse grained. This rock is generally grayish to green in color, and shows the same alterations as those found in the quartz porphyry. Where it is fine-grained and changed to the color of the greenstone it is almost impossible to classify accurately in the field.

The greenstones, or altered quartz porphyry containing the ore are part of a series of rocks, called by Mr. McConnell the Bear River formation. These greenstones vary widely in appearance, ranging from light green and almost normal quartz porphyry to a dark green and highly altered product.

Mineralization is confined largely to the greenstones, and is only present to a minor degree in the brecchia. On the Province claim of the big Missouri group an enormous development of the primary ore replacing the greenstone is exposed. On the Yellowstone group the ore occurs altogether withinin the breccia.

The Province outcrop covers an area on the surface of approximately 1,500 feet by 1,000 feet. The Yellowstone does not show such an area of mineralization as the breccia is not shattered or silicified to the same extent as the greenstone, and mineralization is confined to shear zones and fissures with much higher values, It is possible that this breccia layer is shallow, and that more extensive mineralization, with probable high-grade ore, is present in the underlying greenstone.

The primary ore in the district consists of disseminated sulphides in a schist gangue; sphalerite, galena, chalcopyrite and pyrite, carrying gold and silver.

Provided a substantial tonnage of ore is developed, the district offers no obstruction to successful mine equipment and development. The mineral area is from 12 to 20 miles from tidewater, and no great difficulties to railway construction exist. For an elevation up to 2,000 feet the hills are densely wooded with a good quantity of spruce, hemlock and cedar. Many thousand horse-power, continuous throughout the year, could be developed in Cascade Creek, which flows across the mineral area.

The district should prove of great attraction to the engineer. The ore is complex, and will require skill in its treatment. The rich ore can be smelted direct, but the low-grade offers a broad field for the exercise of the greatest ingenuity that the engineering profession affords.

Are the "Bonanza" Ores of Secondary Origin?

Following the papers read by Major Davis and Mr. Campbell, both of whom expressed a belief that the high- grade or bonanza ores of Northern British Columbia were of secondary origin, came an animated discussion, the question being evidently one of much interest to the British Columbia members.

It was mentioned that the Premier Mine was developed to a depth of 200 ft. in what was considered to be a zone of secondary enrichment and showed no lessening in values.

Prof. Turnbull agreed with Mr. Campbell that the rich ores were secondary, and that below there would be found primary ores of sufficient though lesser richness to give permanence to the district.

Mr. C. Camsell said geologists had always advised prospecting on the edge of the Coast Range batholith, which, in the Portland Canal District, is unusually exposed by the fiord. Remnants of stratified rocks exist within the batholith, which is by no means the solid and uninterrupted mass of granite that some maps would indicate.

Dr. Hodges said, evidently there were areas of rich secondary ores that had escaped the general glacial erosion. He believed that bonanza areas which had so escaped glaciation would be found in Northern British Columbia, in the Yukon and in Alaska.

The Chairman mentioned that some time ago a special investigation of the question of secondary ores had been undertaken by a committee of which Dr. Brock and Dr. Dolmage had been members, and as Dr. Dolmage was present he was asked to take part in the discussion.

Mr. Dolmage disagreed with the previous opinions expressed, and believed that British Columbia ores were of primary origin. They may be later in deposition, but this did not prove that their high values resulted from the processes of oxidation and surface enrichment. The presence of ruby silver, mentioned by Major Davis, was the strongest evidence of the probability of secondary enrichment that had transpired in the discussion, but a number of minerals formerly regarded as secondary are not now so classed. Bornite is an example. This mineral had been found at 1,700 feet below sea-level, and in the belief of the speaker, was a primary mineral.

Dr. Dolmage asked Mr. Campbell if he would elucidate his theory of how the rich ore-bearing areas escaped glacial erosion.

Mr. Campbell believed that the rich ore-bearing areas under discussion had—after undergoing a secondary enrichment—had been covered by breccia deposits of later age of deposition, which had been removed by glacial erosion that ceased before the underlying strata had been attacked, or at least, so attacked as to effect their total removal.

Mr. R. C. Wallace, Commissioner for Northern Manitoba said that in the undoubtedly primary rocks of that district, which had, as was well known, suffered extreme glaciation, the mineral calcocite had been encoun-

tered, a mineral that until recently had been generally accepted as a secondary mineral. This was one proof that the presence of certain minerals did not necessarily indicate secondary origin.

Mr. Fleet Rrobertson, the Provincial Mineralogist, said calcocite had been found at Aspen Grove, B.C., under conditions indicating primary origin.

NEW METHODS IN HYDROMETALLURGY OF GOLD AND SILVER.

The most notable announcement made at the Vancouver meeting was unquestionably contained in Mr. H. N. Freeman's address, who described a method by which, in the final processes of the recovery of gold and silver by cyaniding, metallic sodium was substituted for metallic zinc, thereby enabling the regeneration of the cyanide solution and preventing the losses occurring through the use of zinc precipitation.

Mr. Freeman said:

"The research work, leading up to the development of this process, about 1890, was carried out with the use of potassium cyanide, but in mining operations sodium cyanide now is used to the total exclusion of potash, which is far too costly and possesses no advantage whatever over sodium cyanide. One is inclined to believe that the present custom of cyanide mill operators to express the strength of their solutions in terms of potassium cyanide, when they are actually using sodium cyanide, is the result of propaganda to create a demand for German potash. Even sodium cyanide has been a costly chemical and many attemps have been made since the inception of the process to cheapen and facilitate its production in response to the demand from the mining industry."

"The most important constituent in cyanide is nitrogen, which occurs in limitless quantities in the atmosphere, but which is very difficult to bring into the combined state. The next important constituent in cyanide is the element, sodium, a metal somewhat costly to prepare.

"At the outbreak of the war, the major portion of the world's cyanide was obtained from Germany and it was there prepared by using metallic sodium, and nitrogen in the expensive form of an hydrous ammonia. Numerous attempts have been made in Germany to produce cyanide direct from atmospheric nitrogen but without producing a commercially successful product. However, much success had been realized there in manufacturing a commercial fertilizer from atmospheric nitrogen. This product, known as calcium cyanamid, was at the outbreak of war, produced on a large manufacturing scale in Canada. In Germany, several attempts had not been successful.

"The blockade of Germany and the consequent heavy demand of the South African mines upon the British source of supply, gave me a greater incentive to research upon this line. I may say that the research work, loading up to the manufacturing development of cyanide from calcium cyanamid, was carried out in Vancouver, in collaboration with the American Cyanamid Company of New York," added Mr. Freeman.

Canadian Plant Leads.

The Canadian plant of the American Cyanamid Company at Niagara is the first to produce cyanide commercially from atmospheric nitrogen by this process.

The greater part of the production of the plant at Niagara Falls, Ontario, has been used for the extraction of ore in Mexico, Canada and the western United States and for the fumigation of the citrus trees in California, notwithstanding the high cost of all-rail shipments from Canada.

The use of Sodium Lead Alloys in the Recovery of Gold and Silver from Cyanide Solutions.

In the second part of his address the speaker referred to the process of recovery of gold and silver from cyanide solutions in mills. There were two distinct steps: First, the bringing of the precious metals into solution, whereby they were reparated from the matrix, and second, the recovery of the metal from this solution. After reviewing the chemical process involved. Mr. Freeman, in conclusion, said that several methods had been developed for the production of the sodium-lead alloys requiring only ordinary salt as raw material.. For this purpose it was fused with lead in a small electric furnace. evolving bleaching powder as a by-product.

"Alloys of sodium and lead are very remarkable," he said. "Sodium is a much softer metal than lead, yet the addition of one or two per cent of sodium to lead results in an alloy hard enough for bearing metal. An alloy of lead and sodium containing ten per cent of sodium, is so brittle that it may readily be ground to a fine powder by hand with an ordinary mortar and pestle.

"In studying the chemistry of the gold cyanide solutions, it would seem that in order to recover the cyanide in the form which it would again be available for dissolving gold, the obvious thing would be to replace the gold with metallic sodium instead of metallic zinc. The objection to metallic sodium is that it decomposes water with explosive force and obviously it is impossible to use it as such for precipitating gold, but the employment of a sodium-lead alloy with only three per cent of sodium overcomes this difficulty.

Mr. Freeman explained that cyanide made in Canada contains a certain percentage of calcium chloride which acts as a colloidal congelant and gives a clear solution. It also contains a certain amount of caustic lime which adds a necessary alkalinity and is advantageous in treating ores containing small quantities of copper.

Mr. Fowler, in moving a vote of thanks to Mr. Freeman, said it was a long time since such a radical advance in metallurgical practice had been announced. Mr. Freeman's explanation of an intricate process had been very lucid. Mr. Hedley seconded the motion, which was carried with much applause.

In putting the motion, the Chairman said Mr. Freeman seemed to bring comfort to the distracted gold miner, and Mr. J. A. M. Dawson said Vancouver chemists thought a great deal of Mr. Freeman, taking great pride in the fact that he was a citizen of this city. Mr. Freeman had done work of great importance in discovering the new cyanide process, when the mines were cut off from the original source of supply. Local chemists were looking forward with a great deal of hope in connection with the work Mr. Freeman was carrying on.

THE SMOKER

One of the Vancouver newspapers said, not unkindly, and rather wittily, that the members of the Institute at the smoker on the Thursday evening, which, by the courtesy of the Terminal City Club, was held in its dining room, froliced "on the lower level," from which it would appear that the newspaperman was also an initiate.

The feature of the evening was the trial of Andy Larsen for a grave offence against a Canadian law which members of the Institute believe is honored more in its breach than by its observance. The verdict was that the defendant Mr. Larsen was not guilty, as "six bottles did not make a case," and in the opinion of the jury and the judge—a thirsty mortal—Mr. Larsen verged on becoming a public benefactor. The time-honored rendition of "Drill ye tarriers" was undertaken with disastrous effects. The fooling was excellent, but the fun was not quite so furious as on the night when a certain distinguished gentleman suggested two annual meetings before the general drought.

FRIDAY MORNING, NOVEMBER 28th

With Mr. E. E. Campbell in the chair, Mr. Paul Billingsley of Seattle spoke on—

GEOLOGICAL METHODS AS APPLIED AT BUTTE, MONT.

The speaker said that the Anaconda Company had developed its geological department into a very important branch of its organization, and this had resulted in a number of important factors. "The Butte ores are contained in rather narrow veins in granite. The common widths range from two to twenty feet," the speaker added.

In speaking of the early development, Mr. Billingsly said

that the first geological department was organized in 1900. Since then the work has advanced very rapidly, and has now reached a highly perfected state. The main object for the department has been to help the mine foreman and superintendents through a knowledge of the structure of the ground. As a result of 20 years' experiment it has come to regard the following points as essential: First, friendly cooperation and mutual respect between the mine foreman and geologists; second, prompt geological examination of all new workings in order that suggestions may be made without loss of time; third, accuracy in underground observation; fourth, immediate platting of notes and particularly of structural features upon general geologic maps and sections in order that new evidence may be studied in its proper relation to that already accumulated; fifth and last, a smooth working system whereby conclusions reached by a study of geologic data and translated properly into terms of mine operation.

"At present the members of the department cover about 6,000 feet of working each month," added the speaker. "Underground notes are taken on loose-leaf sheets on a scale suitable to the amount of detail desired. Generally, either 30 or 50 feet to the inch. Colored pencils are used."

Mr. Billingsley showed in coloured chalks upon the blackboard how the notes of the geologists were made intelligible, even after long lapse of time, and he emphasised, what was evidently very true, that the working out of these conventional markings had been carefully done, and was in fact most fundamental.

Dr. Hodge said geologists were very proud of the pioneer work at Butte, which had been a great vindication of their contentions. In answer to Dr. Hodge, Mr. Billingsley said that perhaps 85 per cent of the geological deductions prove to be correct in actual test by development work, and that they nearly always were able to find veins temporarily lost by faulting.

Mr. R. W. Brock said that geologists were themselves to blame for the small regard in which they had been held. They had made geology a high-brow subject, and had considered the application of their science to be derogatory. The Latin motto, which might be rendered "by thought and dint of hammer," contained excellet advice. Geology consisted largely in the careful accumulation of observations.

Mr. Brock regretted that so little attention had been found possible to paleontology and stratigraphy in Canada, particularly in reference to the coalfields. He said that the application of these two branches of geological science had added more to the economic value of the minerals of the United States than any other work undertaken by the U.S. Geological Survey.

Mr. F. W. Gray believed that geological writings were often unnecessarily technical and written so as not to be understandable by the ordinary person. Mr. Brock was a joint author of one of the few works in Canada on Economic Geology that could be read without a headache. The lack of application of paleontology and stratigraphy was noticeable in Nova Scotia, where, probably owing to the inadequate appropriations at the disposal of the Geological Survey, very little more was known regarding the paleontology, the correct horizon, or the correlation of the seams in the Sydney coalfield than was known in Richard Brown's time, about 1870. The application of geology to coal-mining in Canada had been greatly neglected. Mr. Billingsley's paper exemplified the saying that success lay in an infinite capacity for taking pains.

TAXATION OF GOLD MINES

Mr. Holler introduced this much debated subject by stating that the production of gold now was only 60 per cent of what it had been before the war, but that the use of gold now was ten million dollars more, as the jewellers were using great quantities of it. The question was mainly this, "How can men operate a gold mine at a narrow profit or even a loss when they are selling the gold to the arts profession at $20 an ounce, the same price as it has been for years?" asked Mr. Holler.

The only way to get relief, he said, was to get lower taxation and then many more mines could operate. In view of the fact that the arts were using so much gold why could they not be made to pay a tax on this gold and the money put into a fund to be used as a bonus for gold mines. Most of the gold was now shipped to the assay offices or the mint, where it was given to the manufacturers, and thus the collecting of the tax would be very simple. He then introduced the following resolution:

"That a committee be appointed to take up the matter with the provincial and Dominion authorities, and that the council of the Canadian Mining Institute appoint a live secretary and that all the finances be provided by the gold companies. Also that the committee consider the matter of a gold excise tax for all the gold used by the arts whereby they would have to pay $22, $23 or $24, or whatever amount was decided upon for each ounce of gold."

The necessity for some relief of gold mining from the present onerous conditions was generally voiced by the discussion which followed.

Mr. E. A. Haggen said that gold had depreciated 25 per cent per annum and that this question was purely an economic one and should be dealt with by statesmen. "The federal reserve board of the United States have taken steps to rectify this and have withdrawn a large amount of the money used in gambling on the stock exchange. During the war all the countries have been kite-flying and now they are trying to remedy the inflation of currency," he said. In speaking of the Victory Loan, he said that it had been done with patriotic intentions, but that the government had taken every dollar the people were willing to give and he thought this was not right. Lately the government had legislated that the banks could do all the kite-flying they wanted to and had issued a great deal more currency than they were supposed to.

Mr. James White, of the Commission of Conservation, pointed out that the suggestion made in the resolution submitted was economically unsound, and that to place a higher value upon gold—not matter what purpose it was used for—than the standard of gold value would have the result of taking all gold out of circulation and that precisely the same situation would be created that now faced the great powers through the advance of the price of silver to a point greater than the value of silver currency.

At the suggestion of the Chairman, the resolution was laid over for the consideration of the Resolutions Committee, who would frame a suitable formula for the consideration of the afternoon meetings.

Mr. H. N. Thompson of Vancouver read a paper on "Making the Hearth of a Matte Smelter Reverberatory Furnace," which drew an interesting talk from Mr. W. H. Jepp, an eminent Australian engineer, on methods in vogue in his country.

This concluded the morning session.

COMPLIMENTARY LUNCH FROM VANCOUVER BOARD OF TRADE

Mr. Chris Spencer took the chair at the luncheon tendered to Institute members by the Board of Trade,

Dean Milner Roberts of the College of Mines of the University of Washington, dealt at length with the conditions favouring the commencement of iron smelting in British Columbia. He was of the opinion that the Province contained sufficient iron ore, combined with fluxes, fireclays, and coal to make such a venture a success. Dean Roberts also pointed out how great was the preponderance of the produce of the mine in British Columbia revenues. He also said that the manufacture of iron and steel in the West would greatly assist the permanence of the shipbuilding industry there.

CONCLUDING SESSION, FRI. AFTERNOON.

Mr. R. C. Wallace, the Commissioner of Northern Manitoba, occupied the chair.

IRON AND STEEL INDUSTRY IN WESTERN CANADA

Mr. F. W. Gray, Secretary of the Iron & Steel Section of the Institute, and editor of the Canadian Mining Journal and Iron & Steel of Canada, explained that he had been asked to join in a discussion on the possibility of an iron and steel industry on the Coast and had not undertaken to speak to the title on the programme, which was hardly correct, inasmuch as there was as yet no iron and steel industry in the Canadian West, as the term is generally understood.

The speaker stated that all he could do was to review the evolution of the iron and steel plant in the East, and ask B. C. members to apply their own analogies.

The genesis of a successful iron and steel industry in Cape Breton Island came about through the presence of large deposits of coal, suitable for the manufacture of metallurgical coke, close to an excellent harbour, favourably situated with regard to world's markets, near large deposits of limestone and dolomite, and within easy transportation distance of the unique iron-ore deposit of Wabana, Newfoundland. It may here be remarked that even the people of the East have not quite grasped the valuable and illimitable character of the Wabana deposit.

Coal had been mined in Cape Breton for seventy years, but the industry was backward. Winters of idleness, and Summers of rush and hurry to obtain the largest possible outputs, made for unsatisfactory labour conditions, general instability and lack of progress. The resources of Cape Breton lay dormant until a man of vision in the person of Mr. B. F. Pearson collected facts and figures and presented them so convincingly as to interest Mr. H. M. Whitney, with whose advent into Cape Breton there commenced those consolidations of scattered coal properties and the influx of capital which made possible the coal and steel industry of Cape Breton as it exists to-day. Many undesirable happenings mark the Sydney "boom," but, whatever may have been the shortcomings of those days, the result has proved there is a legitimate place for the "entrepreneur," for the promoter of industrial enterprises who has vision and faith—but—before the promoter must come the careful compiler of commercial facts, who must demonstrate from the results of painful research and the slow accumulation of uninteresting but essential facts and figures that a sound basis exists upon which to found the projected industry. That the reward of the man who digs the foundation is often less than the reward of those who come after him seems to be one of life's ironies that must be accepted.

Steel Industry an Outgrowth of Coal.

The lesson taught by events in Cape Breton, and elsewhere, is that a steel industry is an outgrowth of the presence of coal.

The founders of the Cape Breton coal and steel industries appreciated the vital importance of transportation, and they provided large fleets of modern freighters.

Events have also showed that neither the steel companies nor the coal companies of Cape Breton are entirely self-supporting. One is the complement of the other. The underlying stability of the coal companies has enabled the steel companies to take advantage of periods of prosperity in the steel industry, the monetary results of which, in their turn, have greatly helped the coal companies.

"From the Ore to the Finished Ship."

The lesson that appears to be deducible from these gradual developments is that the most successful and permanent combination of industry is that of a associated industry of iron and steel manufacture, with steel-ship building, both based on large reserves of coal, iron ore and fluxes, having a suitable maritime location.

If actual events in the East seem to be foreshadowing the completion of such an evolution it should not be any matter for surprise, as such combinations have proved successful elsewhere.

In the application of this conclusion to British Columbian conditions, it is worthy of note that the technical conditions existing in Cape Breton were always most favourable, and such as might be expected to bring about cheap costs of operation. Nevertheless, the problems of the iron and steel industry have always been those of competitive markets and relative wages.

British Columbia has imperfectly known iron ore deposits, but sufficient is ascertained concerning these deposits to show that they are large and valuable. The maritime and strategic location exists on either the mainland coast or on Vancouver Island, but most important of all considerarions is the existence of coking coal on Vancouver Island.

The analogy between the relative position of the iron ore deposit of Wabana and Cape Breton Island, and the position of Vancouver Island to the known iron-ore deposits of British Columbia is very exact, even to the existence of large deposits of undersea coal on the ertxeme east and west coasts of Canada.

Fuel costs are basic in the iron and steel industries. The problem of iron smelting and steel manufacture is chiefly that of providing great heat heat supply at a low cost.

The possession of large deposits of coking coal of metallurgical grade is British Columbia's chief industrial asset.

Canada's Fuel Reserve Concentrated in the West.

It is questionable whether the people of the West realize the tremendous concentration of the fuel resources of Canada in the two western provinces of Alberta and British Columbia. The map which is attached to the Final Report of the Fuel Controller shows that Alberta alone contains more coal than all the rest of Canada put together, and also more coal than any single State in the American Union. The West also contains the greatest potential oil-reserve of North America.

Empire and national growth follow the possession (and the utilization) of coal, and where coal and iron exists by the side of the sea, wherever true British stock is to be found they must fulfil the maritime destiny of our associated Britisn peoples. It is the way of the race. The future of coal, iron and shipbuilding on the British Columbia coast is not a purely local question. It is far wider in its implications and impartial in its scope.

The considerations affecting a future iron and steel industry are primarily two, viz.,

a. Technical questions.

b. Economic and social questions.

Economic problems come first in importance. If a real necessity exists for the manufacture of iron and steel in British Columbia, the technical problems present no insuperable obstacle.

Dr. Stansfield's Report on the manufacture of pig-iron from B. C. magnetites by use of the electric furnace is full, complete and authoritative, but it must be borne in mind that Dr. Stansfield reported as a professor of metallurgy, on certain set questions, and not as a promoter, and that since his report was made the knowledge of B. C. iron ore resources has been enlarged. Dr. Stansfield's report is the document which will most interest capitalists with serious intentions.

The iron industry of British Columbia—which the future is quite likely to see—should not require aid from new and untried processes. It can, as Dr. Stansfield pointed out, be operated with complete technical success by using the ordinary and accepted methods of metallurgy which have been profitable employed elsewhere.

There is no necessity, and it would be a grave mistake, to be misled by unconfirmed reports of secret processes by which magnetite ore can be converted into steel by the electric furnace.

The economic problems resolve themselves into the question of a market. This should be made the subject of a careful statistical survey of local consumption of iron and steel, and the consumption in that territory over which a British Columbia plant could compete, which should include Alberta, the Yukon, Alaska, and the North-western States.

As to an export market, there would appear to be a good opening on the coast of South America, and while China will some day become the world's greatest producer of coal and iron, yet for the life of this generation, and maybe for fifty years, she should provide a market for pig-iron and steel products.

All these things will require to be compiled with exactness, and made ready for presentation to investors in a form suitable for study.

The social problems include the availability of suitable labour. An iron and steel industry requires a large number of unskilled labourers, and a smaller number of expert workmen, and there will be associated with the provision of these necessary workmen, large questions of transportation and housing.

There is another feature. Capital to-day is very timid, and it has reason to be. Before investors will find large sums of money for an iron or steel plant in British Columbia, substantial guarantees of safe investment must be given, and the social evolution of the province must include the fostering and protection of invested capital.

MR. F. M. SYLVESTER.

Things to be Avoided.

From the experience in the East the things which should be avoided in commencing an iron or steel industry include the following:

a. An unnecessarily large initial capital expenditure.

b. The establishment of a plant of a character too greatly in advance of local markets.

c. A plant of an unbalanced character, requiring orders representing a large tonnage of one product in order to keep running.

d. Too great reliance on subsidies. Subsidies while necessary perhaps in the initial stages of a new industry, should not be regarded as part of the permanent income of any enterprise.

These may seem elementary statements, but in the East they have been taught by painfully acquired experience.

In the discussion which followed, it was suggested that magnetite ores could not be smelted in a blast furnace, as a sufficiently high temperature could not be reached. The speaker said he knew of no difficulty in smelting magnetite ores in the blast furnace except increased cost and a greater expenditure of fuel when compared with more kindly ores. Prof. Daniels confirmed this statement.

Mr. Nicol Thompson intimated that British capitalists have satisfied themselves that the time is ripe for the establishment of a steel industry on the Pacific Coast, and thought it would be in British Columbia.

Mr. A. C. Gardie drew attention to the Copper River district in the North as it contained both ore and coal. If they could get a branch from the G.T.P. to bring out the material, a smelting plant might easily be established near Prince Rupert.

Mr. A. E. Haggen said if they wanted an industry established they should allow those interested to choose the most economical place to carry it on, no matter where it was in the province. Wilmot in his report had selected Union Bay, on Vancouver Island, as the most suitable place for all conditions, but failing that, he considered the vicinity of Vancouver as the next best location.

THE UNIONIZATION OF TECHNICAL MEN

Dr. William Turnbull described the formation and the objects of a number of societies in Britain and in the United States which had for their object the raising of the status of technical men, and the education of the general public to the claims of the technical men for consideration. He held that under present conditions technical experts were not rewarded by any means in proportion to the usefulness of their labors. Still, their first object was service, and they did not want to adopt the trade union method of forcing concessions if they could be obtained in other ways. Between service to others and self-interest, he believed they could find some medium if they could all come together. Speaking of criticism of the B.C. Technical Association, he said: "If it does not suit you, come in and make it suit you."

Dr. Turnbull's remarks were heartily endorsed by Mr. Matheson, the local chairman of the Engineering Institute of Canada.

RESOLUTIONS

The following resolutions, submitted by the Resolutions Committee, were carried, after each one had been thoroughly discussed.

With regard to the resolution of appreciation of the services of Mr. H. Mortimer Lamb, for fifteen years Secretary of the Institute, it should be mentioned that Mr. Lamb made a most fitting reply. It was evident that he felt most acutely the necessity to sever his active carrying out of the secretarial duties, which is enforced by ill-health. Mr. Lamb's best testimonial is the status of the Institute today, which is in large measure a monument to his assiduous work and careful guidance.

In passing this resolution, the Institute did itself no less honour than it gave to Mr. Lamb.

Resolution Regarding Returned Soldiers as Prospectors

"That the Canadian Mining Institute again urge that some suitable plan be provided by the government for aid in prospecting by returned soldiers and that the council take such steps as may be necessary to place the plan before the government in order that it may become operative during the summer of 1920."

Formation of Canadian Association of Engineers Favored

"That the formation of a Canadian Association of Engineers for purposes of social service, mutual protection and legislation is desirable and in the last interests of the public and the profession."

Taxation of Gold Mines and Platinum

"That the council of the Canadian Mining Institute appoint a committee of five to act in conjunction with a committee appointed by the B. C. Chamber of Mines and other committees which may be oppointed by other interested bodies for the purpose of collecting and arranging of data on the taxation of gold mines, and the presentation of this data along with recommendations regarding gold mine taxation to the British Columbia legislative assembly at the next session."

Unification of Mining Laws

"A further motion favored the unification of the mining laws of the various provinces of the Dominion, particularly insofar as they relate to the tenure of mining properties. This was carried unanimously."

Appreciation of Government's Policy in Forming Western Branches of the Geological Survey

"That the meeting place on record its appreciation of the policy of the Minister of Mines at Ottawa in organizing branches of the geological survey in British Columbia under Mr. Chas. Camsell, and in Alberta under Mr. Stewart, and expresses the conviction that this policy has been most beneficial to the development of the mineral resources of this province. That copies of this resolution be sent to the minister and officers in charge of the branches referred to.

Committee on Mining Machinery Tariffs to Confer with Minister of Finance

"A motion was carried favoring the importation of mining machinery free of duty, unless it could be shown that such machinery was made in Canada of a capacity and quality equal to that hitherto imported. A list of such machinery should be made in the presence of partise interested. so that they might have an opportunity of taking up the matter with any commission the Minister of Finance might appoint to deal with it.

Resolution of Appreciation of the Secretary

"That this meeting expresses its appreciation of the policy of the Council of the Canadian Mining Institute in arranging an annual meeting of members in Western Canada and takes advantage of this occasion to place on record its appreciation of the service which the secretary, Mr. Mortimer Lamb, during his fifteen years ... service, has rendered not only to the institute but to the mining industry of Canada as a whole.

Various resolutions of thanks to those who had organized the meeting, and to those public bodies and the Vancouver Hotel, which had afforded hospitality to the visiting members, were passed. Special mention should be made of Dr. Hodges, who was Managing Secretary of the Meeting, to whose energetic organizing is largely due the unqualified success of the meeting.

Especial appreciation was recorded of the manner in which the Vancouver newspapers had reported the proceedings of the meeting. No more accurate and generous account of the proceedings of a technical society have ever been given by metropolitan papers in Canada, and the thanks of the meeting to the newspapermen was in every way deserved.

With the passing of the foreging resolutions the meeting finished its proceedings.

THE BANQUET

Notable as the guests of the Canadian Mining Institute at its annual dinners have been in the past, the Institute never was more signally honored than by the presence at the Vancouver dinner of General Sir Arthur Currie, who was accurately introduced to the members by Mr. Fowler, the Chairman as "Canada's greatest soldier."

General Currie said he felt at home at a dinner of the Institute, and the he was reminded of a dinner held

MR. R. C. WALLACE.

by Institute members in France, presided over by Col John Penhale, and which was ended, as the custom called for, by the singing of "Drill ye tarriers" led by "Foghorn" Macdonald.

The General paid a remarkable tribute to Major Angus Davis, and spoke at length regarding the work of the tunnelling companies in France. He honored the assembled guests by relating some of the less well-known phases of the war.

During his remarks General Currie said the he had been quoted as being in favor of compulsory training, but he said that he was rather in favor of universal training. "The lesson taught by the war was the folly of unpreparedness, and if the policy had been right in the first place I don't believe the war would have taken place. The men who have come back would not have the

same cause for their dissatisfaction, for they went away at the call of the country when she was in danger, and they returned to find men who did not go and who had paid off their mortgages by means of the prosperity they acquired and are now going about in automobiles and with the soldiers' girls. They have good reason to be dissatisfied," said the speaker amid applause. "If the proper steps had been taken at the start of the war we would not have the present unrest and the lack of preparation is directly attributable to this dissatisfaction. I am one who believe in the League of Nations as a help to the peace of the world. I would like to see the lesons of the war carried out and a system by which people would get the worth of their money and enable them to play a part in the British Empire adopted. If Canada is to remain a part of the Empire she must play her part, and if she is not prepared to do this she had better drop out," added Sir Arthur.

Other speeches were made by the Minister of Mines, the Hon. William Sloan, by Senator Bostock, Mr. H. B. Stevens, M.P., and Major Brock.

this had not ben taken advantages of, it would mean that on a 300-ton plant approximately $675 a day, or about $213,975 a year.

On the report of Dr. A. Stansfield, of McGill University it was found that the manufacture of high-class pig iron from the magnetites of the province by the electro-thermic method was in every way possible. Following the publication of this report, there had been many enquiries and the speaker said that New York investors were now considering the launching of an iron and steel industry. If water power could be secured at a reduced rate from that quoted in Mr. Stansfield's report, he had no doubt but that something would be done and done soon.

Mr. Sloan declared that personally he believed that there was room for a 250 to 300-ton plant in British Columbia now, the local market, apart from British Columbia's unrivalled position on the Coast, giving an uninterrupted and direct water connection.

In his closing, remarks the minister dealt with the employment of aliens in the mines, saying that the large mining companies of the province had shown a disposition to view the position from the proper angle. He said in part:

Returned Men First.

"They recognize that, for the most part, the natural wealth of the province must be developed for the benefit of the country and this can not be realized if British subjects, our Canadian boys who fought so nobly in Europe and have returned, are to be discriminated against in favor of Oriental or other alien labor. I feel, very strongly on this question. I feel that the time has come when we must take a definite stand, when we must formulate a policy that will forbid this kind of thing and from which we shall not deviate. We would be failing our returned men, on a question the right and wrong of which is clearly marked, if we permitted the employment of aliens in places that can and must be filled by men of our own race?"

Hon. WM. SLOAN, Minister of Mines for British Columbia.
Getting into touch with his constituency.

SPEECH OF THE MINISTER OF MINES

The Chairman introduced Mr. Sloan as "a real Minister of Mines," a dictum in which the guests appear to quite concur. Mr. Sloan spoke at length and with much grasp of the mining problems of the Province, which he has inspected at first hand during his term of office.

The Iron Ore Resources.

Speaking of the iron and steel industry in this province, Mr. Sloan informed his audience that the iron ores of the province were not confined entirely to the magnetites of the Coast, as this had been disproved by the discovery of a large deposit of hematite and limonite in the Whitewater basin, Bridge River, of the Lillooet district. The ore in this section consisted at a rough estimate according to the Provincial Government engineer, Mr. Brewer, of 50,000,000 tons of high-class quality. As soon as weather permitted the Dominion Government would send in Mr. Scholfield of the Dominion Government geological survey to determine the available ore in the new field.

Action Taken by B. C. Government to Encourage an Iron and Steel Industry.

The first step taken by the Provincial Government, the speaker said to develop the iron and steel industry was on his recommendation, the offering of a bonus of $3 per pound on all pig-iron manufactured in the province from local ore. While

Demand for Silver.

Pointing out that the more valuable the mineral or metal, the smaller in proportion became the freight as the case of gold and, in a lesser degree, silver, Mr. Sloan drew attention to the unprecedented demand for silver and the great opportunity that this situation presented to British Columbia. This province contained large, rich, undeveloped silver deposits which, with the metal at its present price, say $1.20 an ounce, would pay good returns on capital invested.

"Among the many strange changes brought about by the war has been the wonderful increase in the value of silver," he said, "until to-day it has almost reached the sixteen-to-one parity with gold, and prominent economists assure us that the parity of $1.30 an ounce is about assured for about at least five years to come, based on the inexorable law of supply and demand. Thus, what was refused by the law of nations have been effected by the war of nations, and what the silver producer hoped for in 1875 has been handed him in

1919, and this applies particularly to the present silver miners of British Columbia. I would advice them to produce to the limit."

The general opinion that British Columbia silver was almost exclusively produced from the galena (silver lead) ores was characterized by the speaker as incorrect, as the statistics of his department for 1918, showed that about 26 per cent of British Columbia silver was derived from copper areas carrying silver, so that his appeal was directed not only to the operator in galena, but as well to the copper operator.

"Just one more glance at figures before passing from this subject," said Mr. Sloan. "Records show that British Columbia's silver production in 1918 was 3,498,172 ounces. Now this proves that we have a long way to go if we get the share which this province should have of that 463,000,000 ounces for which the world will be looking for every year for some time and which, at the present rate of output is unobtainable. Now mark you the silver producers of the world are going after that market. The deficit must be made up from new fields which have been little developed, and where can there be found a country with greater potentialities in this respect than British Columbia."

Provincial Output.

He pointed out that Canada's silver production in 1918 was 21,284,607 ounces, so that despite the riches of the province, it contributed a comparatively small proportion to the total. So that he could not be accused of being unappreciative of what was being done in development work in the province, Mr. Sloan pointed out the work that was under way in East and West Kootenay, in the Boundary country, in the Salmon River section of the Portland Canal district, as well as at Alice Arm. The development at the Premier mine he predicted would mean much for British Columbia. The Canadian Consolidated Mining and Smelting Company had announced its intention to establish a large concentration fill, probably at Rossland, and at Copper Mountain the Canada Copper Company was completing an exceedingly large development programme.

Silent Toast to the Late Capt. LeRoy

Major Brock, addressing his remarks to General Currie, paid an eloquent tribute to the late Capt. LeRoy, a devoted member of the C. M. Institute, who was, said Major Brock, "the finest company leader I have ever known." At Major Brock's request, the assembled company rose and drank a silent toast to Capt. LeRoy's memory, and the memory of those members of the Institute who also will not return from the Great War.

The dinner ended by some excellent fooling. Major Brock introduced himself as the President of the Pacific Coast Maritime Gold Recovery Company, Limited, explaining that he and his associates had discovered that the sodium atom contained 1,002 molecules, and by knocking off three molecules, they obtained gold — which the speaker gravely informed the meeting, had 999 molecules. By utilising the illimitable sodium content of the oceans the shareholders might hope for large financial returns. And so forth. The guests were duly impressed, and some of them are not yet quite sure whether there was not really something in the scheme. It would not be surprising to find that the reported discovery of the transmutation of metals by Dr. Rutherford is a rumor reflected from this little "stunt" of the grave and reverend seignors of the C. M. I.

Major Brock did his best to emulate "Foghorn" in leading the singing of the C. M. I. anthem, and his rendition of the word "perspoire" was worthy of County Cork. In view of the presence of ladies, Major Brock, with his well-know versatility, fittingly modified the reference to—well—shall we say, the protuberances of Hades!

So ended a gathering that was, as its promoters intended it should, successful and worth while in every way.—F. W. G.

Roof Control in Coal Mines

By JAMES ASHWORTH.

(Continued from page 904, issue 3 Dec. 1919.)

Mr. Rice has apparently concluded that "bump phenomena" are not related to gas outbursts, but result from the rigidity of the overlying rocks and the great weight of cover, and because the whole of the coal has not been taken out all the way from the outcrop, so as to allow the rocks to break down in successive slices". He has also "assumed" that the latest bumps were the result of "improper mining in 1907-1908 of the lower mine, viz., No. 2. In regard to Mr. Rice's report, the author of these notes would comment as follows. At the time of the "bumps" in No. 2, these were attributed to too small pillars having been left to support the roof and therefore it is probably correct to infer, that this is the IMPROPER mining referred to by Mr. Rice. Now if, as has been stated, the roof in No. 2 mine had in 1908 forced the small PILLARS into the pavement, and filled with fallen rock the spaces from which the coal had been extracted, the assumption of improper mining does not appear to have been proved (see Mr. Shanks paper on Bumps, C. Mining Institute Bulletin.) The great object of safe coal mining is, after extracting the coal, to make the roof fall and to bring it into close contact with the floor. The area in question was worked out earlier than 1908, and therefore it is not apparent or proved that the overlying strata up to No. 1 East of say 90 feet or less had not settled and compacted the roof in nine years, and if it had not, the fact would have been demonstrated in No. 1 East mine as soon as that area was reached. It has moreover been observed, that wherever No. 2 mine has been worked on the longwall system there have been no serious bumps, whereas under M. Rice's agument as to "improper" mining the results ought to have been worse than with so called pillars.

Mr. Rice's suggested "cure" for the bump malady is to drive six parallel roadways into the mine, three for the intake air and three for the return airways, and when these have been driven and only one fifteenth of the coal extracted, (only one fourth was extracted before), then the real getting of coal is to commence per haps five miles perhaps ten miles inbye. There is no statement as to where this extraction is to commence nor is there any descripion as to how this extraction is to be safely accomplished.

The erection of very large ventilating fans, watering the roadways, double burned flue dust explosion barriers, electric safety lamps, etc. are in the category of prevention against firedamp explosions, which have never yet occurred from any recorded bump.

The question of profitable working is not directly taken into account, and therefore in view of the restrictions, it is possible that the working of the coal may incur a loss possibly in excess of its sale value, especially when a further cost is added for 100 feet bore holes in the face of every heading, seismographs etc., etc. The reason why such long bore holes should be suggested is not apparent, as high gas pressure is not given as one of the factors in the production of bumps, neither have bore holes been found to be an effective protection to mines which have produced notable outbursts of gas, excepting in one case known to the writer, where the outbursts were from the floor and the floor was drilled to an underlying coal.

The special difficulties to be overcome in the Crows Nest Pass coalfield are in the summary stated to be,— "Unusual natural difficulties; coal is under heavy load; coal beds very gaseous; "bumps" not related to gas outbursts; overlying rocks are very rigid and there is a great weight of cover; too much coal extracted in advance mining; or not taken out completely from the outcrop; which would break the overlying rock in slices and prevent "bumps".

"Bumps" are believed to be caused by subsidence of roof in certain areas under rigid rocks, leaving a great unsupported span of rock stratum. Fig 6.

When one of these has given way it means the hammer like blow of thousands of tons of rock striking on the immediate roof or flexible stratum overlying the mine, which in its turn imparts the blow downwards, breaking timber, causing extensive falls in the mine and sending rock tremors through the strata."

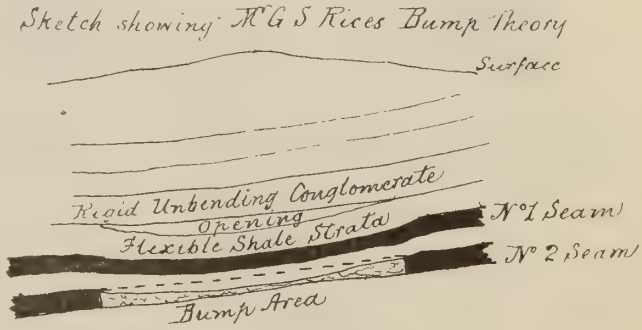

Fig. 6.

Mr. G. S. Rice's "Summary" was accompanied by "An Outline of Policy Adopted to Date by the Department of Mines",—in which it was announced that seismographs would be established to give warning of possible earth tremors. In reference to experimental methods of mining the coal the following method was to be adopted in No. 1 mine East, "A large pillar of solid ground will be left to support the bump area. Main entries will be driven through the temporary prohibited area, and driven on until a selected boundary is reached, when retreat will begin.....Under this plan less than 15% of the coal would be extracted in the advance."

To increase the safety of the mine as now at work and also in the future, the "rash" and "top coal" on the haulage and air ways is to be stripped down to "remove the danger of men being smothered by falls of this material simultaneously with bumps".

"In the gathering of samples of gas—the analyses have proved that the Crows Nest Pass Coal Field is the most gaseous field in the world."

The Gas Yield,—"—The gas flow in the mines is not so much from the breaking of the coal at the face but is largely governed by the area of the face exposed, so that it may be expected that the larger these mines

are made and numerous pillars standing, even though the tonnage actually produced daily may be small, yet large quantities of gas may be generated".

Gas Testing Machines,—the Department selected the Burrell Gas Detector which will detect from one tenth of one per cent up to three per cent.

It has since been discovered and accepted by the Department that a one quarter inch cap shown by the Wolf safety lamp represents 2½ per cent of Methane and indicates the point of danger at which the miners must be withdrawn. The necessity for this important decision of the Department of Mines for British Columbia has often been referred to by the present writer in his reports, because in past time the firebosses have had no rule to guide them, and have either reported "a little gas" or "small cap of gas" and infrequently "explosive gas," but there was no statutory "danger point".

Other points are also referred to but they do not affect the question of "Roof Control" to the same extent as do emissions of explosive gases, and need not therefore be discussed here.

Outstanding conclusions in Mr. Rice's report.

After reading the quotations, which are a little condensed as above, we find certain outstanding points, (1), that "Bumps" are not related to outbursts of explosive gases; (2), that "Bumps" are believed to be caused by the subsidence of roof under rigid rocks; which later break down in great masses; (3) that improper mining in No. 2 mine caused the bumps in No. 1 mine, why improper not explained; (4) bumps may recur over the same area; (5), new operations will take out not more than 15% of the whole seam in No. I East mine; (6) bore holes to be made to give warning of impending outbursts of gas; (7), well kept airways and powerful fans to be added; (8), a permanent commission to further investigate and review, —the following points (a), topographical survey, including surface cracks; (b), Seismographs, to give warning of earth movements; (c), carry on experimental work on methods of mining coal especially No. I bed; (d), to gather samples of gas, ascertain amount of and now held; (e), to continue to take samples of mine air for chemical test; (f), to drill long bore holes the practical effect of which would be to determine the rate at which it would be wise to allow the entries to advance, (g), the question of methane flow and pressure which is going to be of an increasingly serious nature in all the mines; (h), appointment of a Commissioner to determine how the collieries are to be laid out; (i), tunnels may be required six, eight, or ten miles in length. (G. S. Rice up to this point.

Recommendations in the Rice Report adopted by Dept. of Mines.

The Department of Mines agrees to (a), (b), (c), and states how this is to be carried out; but "when the seams are adapted to longwall mining, it is contemplated using this method of mining". (d), have proved that, the gas flow "is largely governed by the area of face exposed".....the larger these mines are made and numerous pillars standing, even though the tonnage may be small, yet large quantities of gas may be generated"; (j), have adopted a gas testing machine to detect small per centages of methane; (k), Edison Electric safety lamps, larger fans, intakes and returns for each mine; (i), double burned ashes and watering to be applied to neutralize explosive conditions of the dust;—also rock dust barriers;—(m), has fixed a standard gas cap as the withdrawal point for miners; (n), that an interval of four hours should elapse between shifts; (this is now in force).

The "nether roof" not mentioned in departmental reports.

In summing up the foregoing notes on roof control, and the present position of the most important detail of the safe working of coal mines in the Fernie district of British Columbia, it is necessary to call attention to the fact that in no case has the "nether" roof been referred to, and it has apparently been assumed that the "roof" to be considered extends from the coal seam to the surface. If it were so, then the timbering in the mine must be assumed to be strong enough to resist the pressure of the whole thickness of the strata up to the surface, and not up to the "nether" roof only. In this connection it would appear that it is not definitely known to what height the roof movements extended when the workings were carried out on the longwall method of extraction. It is however necessary to ascertain the height at which this nether roof is operative especially in the No. 1 mine east at Coal Creek, when deciding on the size of the pillars to be left in the first working. As the matter now stands we are told that 85 per cent. of the whole coal seam is left in pillars to provide against "bumps". This again would lead us to conclude that the height of the nether roof is calculated to reach up to the ground surface.

In the case of No. 2 mine, and the so called "improper working of this mine (see Mr. Rice's report) has a pronounced effect on the No. 1 East mine above, it seems fair to assume that No. 1 East mine formed the nether roof for No. 2 mine, and therefore as the long wall method of working the latter mine has never produced any serious bumps, nor in any way injured the No. 1 East mine above, it would seem to be proved that it is a better and safer method of extracting the coal than any pillar and stall method of extraction depending on the size of the pillars.

Both mines have at times suffered from serious bumps, but only when worked on the pillar and stall system, consequently as shown by past experience No. 1 mine East would be less subject to bumps if it were worked on a modified long wall system by which 85 per cent of the coal might be extracted in the first working, and 15 per cent lost in small abandoned pillars which would easily crush and let down the roof.

Influence of Faults in causing "Bumps".

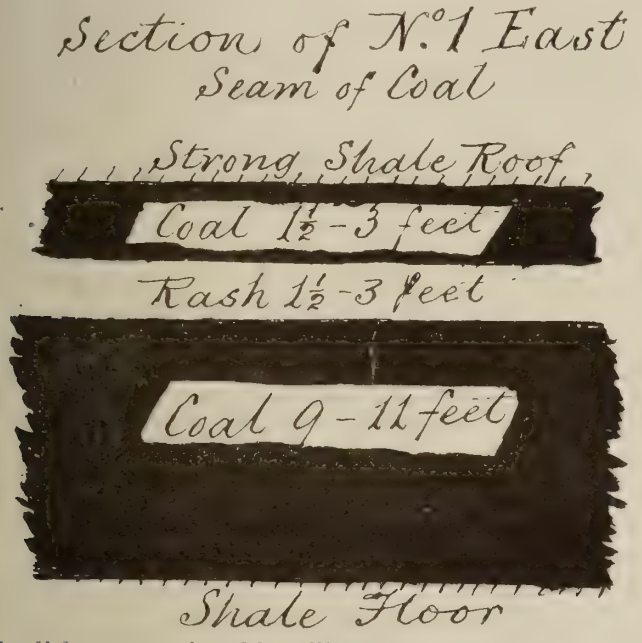
There is moreover another factor which has received no attention whatever, and which has probably more influence on bumps than any other factor in the problem, and that is faults. Thus, in No. 1 East mine there is a fault with a south west to east north east direction and crossing the creek is also found in old No. 1 mine. On the south side of the creek this faulting brings up the No. 2 mine to the level of No. 1 East; and in Nos. 2 and 3 mines, which are really the same seam, there is a fault about a mile inbye which runs in a northwesterly direction and joins the first fault referred to. Part of this fault line appears on the plan exhibit No. 4 marked "crumpled area", see Minister of Mines Report for 1917.

The influence of this faulting was more clearly demonstrated on the north side of the creek in old No. 1 mine, which corresponds with No. 1 East, here the

east north east fault was on the eastern side of the workings, a crumpled zone was on the north side, the outcrop of the same seam on the west side and an open side to the Creek on the south side of its workings. It is not surprising therefore to find that a break in the mountain took place from east to west and extended right up to the surface, and put an end to the bumps on that side of the Creek.

Possible effect of Rigid bed of Conglomerate above No. 1 Seam.

There is also another factor which requires to be taken into consideration, viz, a thick bed of Conglomerate above No. 1 mine. Doubtless this has an important influence on the breakage of the strata above the coal if bumps are to be prevented, which in plain



English means that big pillars are a danger, because they prevent the roof breaking down in regular sequence as the coal is worked. When the roof breaks down in regular sequence the pressure on the coal seam is reduced and it is in its safest condition.

Emission of Firedamp.

As this article is on roof control the writer does not propose to consider the question of the production of firedamp in detail but as it has been proved that this is in proportion to the area of the exposed surface of the coal, it follows that the small pillar or no pillars at all will reduce the surface exposed per ton of coal extracted, and consequently reduce the volume of firedamp per ton, which has been stated to be equal to one ton of firedamp per 20 tons of coal gotten.

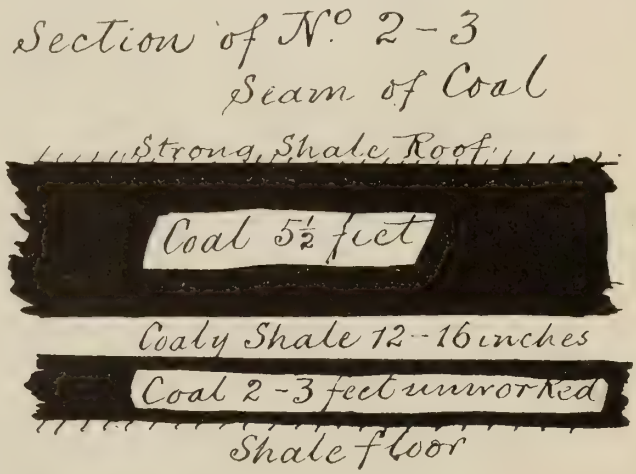
As regards the influence of occluded gas the evidence so far collected appears to prove that its pressure in the solid coal is not sufficient to add in any way to the mechanical effect of roof bumps, but it may have an influence where the bump is demonstrated by the lifting of the floor, as detailed in some of the occurrences at Coal Creek in No. 2 mine.

Hydraulic method of stowing the Goaf.

Roof control when considered as a means of avoiding the danger from bumps, would not be in any sense complete without a reference to the hydraulic method of stowing the goaf. This is in practical every day use at many colleries where thick seams are being worked and with great success, as it may be applied to any method of working, and leave no goaves to fill, and remain filled with gas. In the Crows Nest Pass coalfield there would however be a part of the year when the intense frost might render its application difficult.

At the Dalzell Colliery in Scoland hydraulic stowage has been in regular use since 1911. Its adoption has rendered the safe working of the mines possible and practicable and nullified the risk due to the possible breakage of the roof strata which would bring down an influx of water.

In working a mine like the No. 1 East at Coal Creek, which in the official reports is classed as the most dangerous or gassy mine in the world, the importance of goaf stowage cannot be too earnestly considered, because even with the "approved" method of working set out in some detail in the British Columbia Minister of Mines Report, the area of surface of ex-



posed coal increases every day. This adds daily to the risks by requiring increased volume of air to sweep away the gas or reduce it down to say one per cent of methane in the main returns, and the goaf areas become reservoirs of either methane or firedamp. The approved plan shows no panel sections in the mine, and therefore a disaster in one district cannot be isolated from the rest of the mine.

Appointment of Commission Advocated.

Both the Premier and the Minister of Mines of the British Columbia Government have promised to appoint a Commission or Commissions to enquire into various questions affecting the safety of these mines in particular, but for some reason not publicly known this much to be desired enquiry has not yet commenced, —neither were there any additions bearing on this subject made to the 1911 Mines Regulation Act when the Act was revised in 1919.

For some length of time the miners have insisted on working only one coal-getting shift in each 24 hours, instead of two coal-getting, and one repairing shift, but it does not appear that this has lessened in any way the liability of the mine to "bumps", and so far as the emission of gas is concerned the reports, so far made public, do not how any material difference in the volume found in the main return air courses, and therefore it seems very desirable to have the opinion of a competent Commission at as early a date as possible.

NOTES FROM THE FAR NORTHWEST

Yukon-Mayo District

120 applications have been forwarded to the Gold Commissioner's office at Dawson covering claims staked in Keno Hill. The claims are scattered all over the hill for a distance of four to eight miles. It is likely others have been staked within the area, but have not been forwarded from Mayo by the recorder owing to the infrequency of the mail.

Snows came early on Keno Hill and few cared to go into the region after snow started to fall. Again it would be impossible for a stranger to find his way about and to avoid staking over tops of other claims.

Within the last week or two many grants have been issued to men who staked claims on Keno and Extension during the summer and fall.

Large Hydraulic Plant Proposed for Tibet Creek, Alaska

Mr. George Adams, who has just gone South to Seattle, has been operating on Tibet Creek with two No. 6 Giants. The location is 107 miles Northeast of Telegraph Creek.

Hydraulic operations on this property are operated under most favorable natural conditions, with 400 feet head pressure and an unlimited supply of water. 600 feet o fduming ground is afforded by Tibet Creek Valley.

With 13 one-half mile leases, Mr. Adams is preparing four distinct hydraulic plants on the property, each using two No. 6 Giants. This will make the largest hydraulic plant on the Continent.

$100,000 Cash for Pioneer Mine, B. C.

The Mining Corporation of Canada has purchased the Pioneer Mine at Cadwallader Creek, Lillooet, near the Pacific Great Eastern Railway. This announcement was made by Mr. W. R. P. Parker, Vice-President of the Corporation.

Development will begin on an enlarged basis. The Pioneer was sold by Adolphus Williams, K.C., and the two Ferguson Bros., who have owned and operated the mine for two years past. Considerable gold was taken out by them.

The Mining Corporation of Canada are becoming active in British Columbia. They at present have a proposition at Barkerville where they are developing some properties on the Mother Lode.

With engineers in many parts of the world Vice-President Parker's only regret is that they did not turn their attention to British Columbia much earlier.

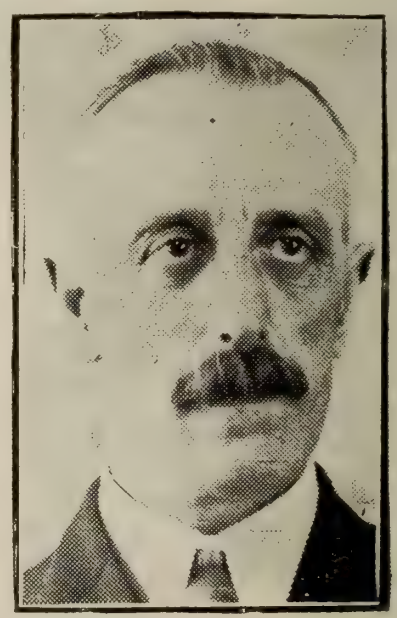
PORT ARTHUR NOTES

By J. J. O'CONNOR.

Port Arthur is not likely to suffer any inconvenience through the coal strike. The fuel situation at the lake front here is about normal. It is estimated that there is sufficient fuel on hand to meet all requirements, for railway, commercial and domestic purposes.

Importations of anthracite to Nov. 1st were 349,789 tons, as against 251,210 tons for the corresponding period in 1918. In storage here on Nov. 1st, 139,800 tons, on the same date last year there was 86,100 tons in store. The western movement has been greater than last season, so that it is expected that the quantity on hand on December 1st will be about the same as last year.

News of the contemplated division of the Department of Lands, Forests and Mines, and the creation of a separate Department of Mines, was most favourably received in this portion of the province. It is felt by all those who know him, that the Hon. Harry Mills, the new head of the Department, will do justice to the position, and that Ontario's great wealth in gold, silver, copper, nickle, iron and all of the non-metallic minerals, are worthy of a separate Department, to which the Minister's whole attention may be devoted, something that hitherto was impossible, that, given the attention the Hon. Mr. Mills is certain to apply to it, the portfolio of Mines will soon rank as one of the first in the Cabinet, and that Ontario's premier industry will come into its own.



HON. H. MILLS.

There is probably not sufficient anthracite on hand to supply all demands, but if shortage occurs, it may be easily made up by an increased use of bituminous coal.

The imports of the latter, to Nov. 1st were 396,427 tons, as against 288,419 tons to the same date in 1918. This refers to commercial coal only, and does not include railway fuel.

L. L. Stevens, M.E., and L. V. Stevens, M.E., of New York, spent about a fortnight in the examination and study of geological formations in this district. They covered a considerable portion of the older mining areas, and have become so interested in their investigations that it is their intention to return at an early date, and pursue this work.

The Lake of the Woods gold area is about to experience a revival of gold mining. The Mikado Mine, at Shoal Lake, has been sold to Chicago interests, headed by Robert Wachman, and will be put under operation at an early date. Some of the most spectacular gold ever seen in the northern country, was taken out of the early workings of this mine some years ago. The new owners are confident, that, with the improved methods now in use, for the recovery of values, they will be enabled to make the mine a good producer.

The Grace Gold Mine, and the Norwalk gold property, situated in the Michipicoten gold area, six miles from the Algoma Central Railway, have been sold to W. A. Burmeister, of Chicago, for $80,000 cash. Both these properties are now under active operations, with a full equipment of men and plant.

The Foley Mine.—Another of the old-time gold properties of the Lake of the Woods gold region is about to be revived, and the activities of the late '90s repeated on a more modern and extensive scale. The improved methods, now in use, for the recovery of values, make it possible to operate mines at a profit today, that some years ago, could only be operated at a loss. The saving of values effected by the methods of today, more than offset the increased cost of labour, and all materials that enter into the problem of mining.

The "Foley Mine" situated on Shoal Lake, six miles south of the Canadian National Railway, (has been purchased by the Swedish-Canadian Gold Mining Co., Ltd., represented by J. A. Johson. The "Foley" comprises 191 acres, on which some thirty veins have been located. The company have also taken over several other mineral lands in North Western Ontario, and now own 955 acres in all.

The Swedish-Canadian Gold Mining Co. is capitalised at $3,000,000 and has $1,500,000 in the treasury.

There is a 20 stamp Fraser & Chalmers mill on the property, in good condition, together with camps and other necessary buildings to accommodate a staff of one hundred miners. The work of constructing an aerial tramway 1,600 feet in length, to convey the ore from the shaft to the mill, will be commenced Jan. 15th, 1920.

Two shafts have been sunk, 200 and 420 feet respectively. The 200 foot shaft will be used as a central shaft. Active mining operations will begin Jan. 15th. A drift will be run from the 200 foot shaft to connect with the 420 foot shaft, 1,200 feet to the north, this drift will be on the vein, which has an average width of 8 feet.

A cyaniding plant will be installed that will effect a saving of 95 per cent of values, as against 55 per cent under the old operations.

This property has been examined and reported on by such well known mining engineers and geologists as the following: Walter G. Cole, Horace V. Winchell, mining geologist, Fredick Gleason Corning, E.M., J. H. Chewett, M.E., R. A. Kerr, M.E., J. A. Wood, and E. P. Rathbone, E.M., all of whom make favourable reports on the property, giving values, averaging from $9,45 per ton, to $24.00 per ton, on the various veins.

From 75 to 100 miners will be employed, under the superintendence of Mr. J. A. Johnson.

A good waggon road, with nominal grades, runs from the railway to the mine, on the south, it has water communication with Fort Frances, 42 miles to the westward. In the vicinity, there is ample water power for all mining purposes, of easy access and development.

TORONTO NOTES

Dr. M. Y. Williams on Oil Prospects in Northern Ontario

That oil exists in Canada's northland and that the indications are very promising is the conviction of Dr. M. Y. Williams of the Canadian Geological Survey, who has spent some time investigating the possibilities, and who is now preparing a report which will be published by the Ontario Department of Mines. The only public reference so far made to the oil discoveries is in a souvenir booklet prepared in connection with the visit of the Prince of Wales to the Cobalt district in which Dr. Williams gives some indication of the line his report will take. In an article dealing with the resources of the north the booklet says: "At some time in the not very distant future it is probable that the Temiskaming and Northern Ontario Railway will be extended to James Bay. In that event further mineral fields will become readily accessible. Fifty miles north of the Transcontinental Railway on the Mattagami River an extensive deposit of excellent fire and china clay has been located. Farther north there are prospective oil-bearing formations." Dr. Williams summarises his conclusions as follows:—

"Two formations known to occur south of Moose Factory may contain oil. These are the "Corniferous" limestone and the "Salina Shales." The rock structure is favorable. The Salina Shale is fairly deeply buried over considerable areas and probably retains any oil which it may originally have held. The "Corniferous" limestone is mainly stripped of its shale cover excepting over small areas where the shale occurs, principally in synclines, in structure not favorable for oil. Drilling in suitable areas alone can give final results. Black Huron shales occur near the foot of the Long Rapids on the Abitibi River. Thin beds of green clay shale occur in the black shale and some highly calcareous beds also occur. The latter are in part petroliferous. Samples of the oil shale have been submitted for examination but the results have not yet been reported."

Toronto People Interested in Radium Claims in Butt Township

The Mining Corporation of Canada have taken an option from Rinaldo McConnel on 74 acres of land in the Township of Butt, on the west side of Algonquin Park. The ultimate price is $10,000, of which $1,000 has been paid down. This property adjoins the large holdings of the Elliot Syndicate of Chicago, on which pitchblende and ore of radium have been discovered. The Bureau of Mines has reported that this ore is much richer in radium than any hitherto found in the United States. A number of Toronto people have also secured property in Butt. One of the largest holders is R. B. Rankin, of the Standard Bank Building. He and his associates have altogether 300 acres adjoining that on which the recent find has been made.

Canadian-American Resources, Limited—An Incorporation with Authorized Capital of Fifty Million Dollars

M. G. Hunt, barrister, Toronto, has announced the formation and incorporation in Ontario of a large concern known as the Canadian-American Resources, Limited, with an authorized capital of $50,000,000. Both Canadian and American capitalists are interested, and it was stated that developments and production in mining and oil was anticipated on both sides of the line. Already some properties in the United States are in view awaiting action by the new organization, but nothing definite has been secured in Canada as yet. It is expected that attention on this side the line, will centre chiefly in Northern Ontario. Engineers will be available to promptly investigate properties, and it is anticipated that operations will be carried on on a large scale. "It is the intention of the officers of the company," said Mr. Hunt, "to acquire only properties of value and have them operated by the company itself. The company will be equipped to carry on its own refining processes." The officers of the company are: President, Alexander Alexander, New York, President of the National Gum and Mica Company, and connected with several other large corporations; Vice-President, L. E. Denyes of Toronto, director of a number of corporations; Secretary, Dr. R. Gordon Bogart of Kingston, Ont., prominent in several Canadian industrial concerns; Treasurer, George B. Leighton, New York, President Lone Star Shipbuilding Company; directors, Col. Jacob Ruppert, New York financier and sportsman; George B. Gifford, for thirty years connected with the Standard Oil Company of New Jersey and manager of refining corporations; S. W. Jenckes, Sherbrooke, Que., a manufacturer with interests there and at St. Catharines.

Our Northern Ontario Letter

The quotation for silver has reached a point where the silver content of the silver coinage of Canada and the United States exceeds the face value of the piece. Between the silver coinage of these two countries and the melting pot is but one obstacle—the law. In the exercise of this, the writer believes, special legislation is necessary. It was at least found to be necessary in such countries as France, and finally in the British Isles.

Early in November your correspondent, in reviewing the opinion of metal authorities at the points of distribution, as well as the views of the silver producers, pointed out the advisability of anticipating a continued upward swing in quotations. As to this, however, the authorities at Ottawa appear to be letting matters drift. At the time of writing, the same is true of the United States.

The fact is that today the silver currency of these two countries is threatened with wholesale mutilation, and the governments appear to have failed to even warn the unscrupulous against such practice. As a result, a condition exists which might well cause a more or less rapid diminution of silver currency.

Silver is scarce, the price is high. Silver coins are flowing freely, they contain greater silver content than their face value. What may a great many silversmiths throughout this continent be expected to do?

Should quotations continue to advance, we may witness in Canada and the United States a great dearth and small change, and, perhaps, then witness the spectacle of the government bringing down legislation to suppress an evil that has already caused great inconvenience and much actual loss.

As a result of the high price of silver, and expectation of long-continued demand the scope of operations in the silver-bearing districts of Northern Ontario have taken on proportions greater than since production in Cobalt was at its maximum and the outlying districts were enjoying their short-lived boom.

So far this year some thirty mines in Cobalt have contributed to the output. Two Gowganda mines shipped ore, and one from South Lorrain. The indications appear to be that this total of 33 shippers so far this year will be added to somewhat in 1920. Not only is this indicated by the present activity and success in the Gowganda field, but may also prove to be true in Cobalt where some new small operations are commencing and where others are under contemplation.

According to recent advices, the Nipissing mine now has a surplus of some $4,300,000, which is the highest in the company's history. Despite a decade and a half as a leading producer and having paid dividends approximating close to $20,000,000, the Nipissing continues to produce at the rate of close to $5,000,000 a year, and holds unchallenged the position of being the largest silver producing mine in the British Empire.

The negotiations between the Northern Customs Concentrator and the Chambers-Ferland, as mentioned recently in these columns, resulted successfully, the former company purchasing 25 acres of the Chambers-Ferland (lying to the east side of the railway.) The price is stated to have been in the vicinity of $200,000.

J. P. Bickell, president of the Temiskamig Mining Company, paid a recent visit to the company's Cobalt mine, where considerable high grade ore is being de-

veloped. The physical condition of the mine is now such as to encourage the belief that dividend disbursements may be resumed at an early date. The treasury contains close to $1,000,000.

The Beaver Consolidated continues to encounter substantial quantities of high grade ore. In this connection President F. L. Culver has issued the following statement:—

BEAVER.—Since mailing the annual report to the shareholders, we have had strenuous times in the North Country. The spirit of unrest, which is dominant throughout the world, has not escaped the North, and in the Cobalt Camp work was suspended for a period of seven weeks on account of labor difficulties. However, these difficulties have been satisfactorily adjusted, and operations were resumed about September 9th. Recently we have made discoveries of rich, high grade ore, which are most important—on the 200-, the 600-, and on the 700-foot levels. On the 200-foot level, working from a little slip, we found a vein carrying very rich ore running parallel to a drift which was very productive in the early days. As yet we have not determined the extent of this vein; assays, however, give us values as high as 4,000 ounces to the ton. On the 600-foot level a shoot of high-grade ore was encountered, which seems to be an off-shoot of one of the old ore-bearing veins. Work will soon be started to intercept this at the 700-foot level. On the 700-foot level on the No. 3 vein system we have encountered high-grade ore which has been opened up for a distance of 120 feet. This ore will run between 2,000 and 2,500 ounces to the ton. On the No. 5 vein system on the 700-foot level we have recently discovered a new shoot of ore in virgin ground which we have opened up for a distance of one place, about 10 feet long and 3½ inches wide, the ore is about 40 feet. The vein is carrying good high-grade, and at estimated to run 10,000 ounces to the ton. This ore body has yet to be developed both above and below the 700-foot level. Since resuming operations we have shipped 79 tons of silver ore.

KIRKLAND LAKE.—At the property of the Kirkland Lake Gold Mining Company, in which the Beaver is so largely interested, labor conditions forced the suspensions of operations for a period of about 18 weeks, from June 12th to October 15th. When work was suspended the stopes on the 400-foot level were filled with ore ready for the mill. On the 500-foot level we had been changing the grade since resuming; have this work completed, and are putting in chutes and breaking stopes. No stoping has been done on the 600- and 700-foot levels, although both drifts are in excellent ore, which is being raised to the mill. As soon as the drifts are carried a little farther, stopes will be broken in both of these levels. In future all ore between the shafts will be trammed on the 5th level, which will greatly reduce our operating costs. The mill is now operating at full capacity, treating 150 tons a day. Scarcity of good miners is hampering our underground operations somewhat, and we are forced to supplement the tonnage from the underground by raising from the surface dump. However, we believe it will not be long before our underground operations will be on a much larger scale.

A new company has been incorporated, known as the Hargraves Consolidated, for the purpose of taking over the old Hargraves and the Reliance, both properties situated in the Kerr Lake section of the Cobalt camp. A plan of operation is stated to be under consideration. The new company has an authorized capital of $2,500,000 made up of 2,500,000 shares of the par value of $1.00 each and with 1,800,000 shares issued.

The McKinley-Darragh has declared a regular 3 per cent dividend, payable January 1st. The disbursement will amount to $67,428 and will make to total paid to date amount to $5,686,735.

Diamond drilling operations have commenced on the Adanac property, one machine being employed to drive a horizontal hole. The machine is working from a cross-cut at the 310 ft. level, the hole being drilled for the purpose of exploring the territory adjacent to the Gans property of the Temiskaming Mining Company. Other underground operations on the Adanac have been suspended.

Underground mining operations will shortly be under way at the Peterson Lake property, part of the workings having already been de-watered. On the part of the directorate and management there is manifest a tendency to regard the old Seneca lease as likely to yield further revenue. They point to the fact that at the time the rich Seneca vein was mined, a substantial quantity of low grade ore may have been passed up owing to the fact that at that time the price of silver averaged about 55 cents an ounce as against upwards of $1.30 at the time of writing.

At the Temiskaming mine a considerable quantity of ore has been developed during the current year, and further profit has been carried to surplus which at the beginning of this year amounted to some $900,000. The management, however, declares that the new ore shoots opened up are more or less patchy and their full importance cannot yet be estimated. Among not a few of the shareholders the present physical condition of the mine and the strong financial position may enable the directors to resume dividend disbursements early in 1920.

The Beaver Consolidated continues to mine substantial quantities of high grade ore at and above the 700-ft. level.

The Trethewey-Cobalt Company is meeting with success in the development of the Castle property in the Gowganda district. At the time of writing, the new shaft has reached a depth of 100 feet and a substantial shipment of high grade ore is being assembled ready for shipment. The consignment is expected to be sent out during the last half of December. At the beginning some 205 bags had been taken out, and this number was being added to at the rate of around ten bags daily. It is also learned that in the main workings at a depth of 400 feet some high grade ore has been encountered in a strong vein. The shipment will be the first from the Castle property.

The Reeves-Dobie at Gowganda is now operating its mill and producing at the rate of not for under $1,000 every twenty-four hours. As yet this company has confined its effort to surface, not going below a depth of 100 feet. As to whether or not there is sufficient tonnage in sight to continue the present rate of output for a long period has not been announced.

The general outlook in the Gowganda district is quite favorable. The three producers, namely: The Miller Lake O'Brien with an established record of over $1,000,000 annually, the Reeves-Dobie producing $1,000 daily at least for the time being, and the Castle property to join the producing list this month, lends to the Gowganda area considerable importance. In addition to the producers, there are a number of

new operations under way with fair prospects of developing into shipping mines. Such properties include the following: The Walsh property, which adjoins the O'Brien on the South, and which is controlled by Jack Walsh of Montreal; the Miller Lake Silver Bullion, formerly held by interests who are associated with the Hudson Bay Mines, but now under the option to Montreal interests; the Eastern property situated on the East arm of Gowganda Lake, and which is said to be controlled by interests who are identified with the Eastman Kodak Company; the Collins property at Leroy Lake, as well as the Silver Bullion property in that district. In addition to the shipping mines, as well as the Silver Bullion property in that district. In addition to the shipping mines, and the large number of other active properties, there are a number of important deals pending. Among these might be mentioned the Everett property which adjoins the Castle and which is being secured by interests with whom is associated Sir Henry Pellatt of Toronto.

Everything considered, there appears to be reasonable assurance that the Gowganda area may serve to replace to some extent at least the natural decline in silver production in other centers.

In the South Lorrain area there are also signs of reviving interest. This week, according to a report from Toronto, J. M. Wood and Robert Josey, original stakers of the Keeley mine, have sold their Beaver Lake property, and work is to commence at an early date.

Cobalt Shipments of Silver Ore—No Bullion Shipped

During the week ended Nov. 28th, four Cobalt companies shipped an aggregate of four cars containing approximately 323,321 pounds of ore, as shown in the following summary:—

	Cars	Pounds
Buffalo	1	110,000
McKinley-Darragh	1	84,274
O'Brien	1	61,850
Hudson Bay	1	63,197
Totals	4	323,321

During this period it is interesting to note that no bullion shipments were made. The absence of bullion shipments is remarkable for the reason that the mines are all producing at full blast and the average price of silver during the week was the highest in Cobalt's history. The incident appears to indicate an expectation on the part of the mining companies that quotations for silver will advance to still higher levels.

During the week ending 6th December, shipments of ore from Cobalt amounted to only one car from the McKinley-Darragh, the consignment amounting to 108,145 pounds. The reason for the low shipments may be attributed to winter having set in, which always has a tendency to handicap shipment of crude ore. Another is the fact that an increasing quantity is being treated locally. From this date until spring, ore shipments may not be expected to be large, although the bullion shipped during that time will be heavy.

Following the sale of 25 acres of its property, the Chambers-Ferland has commenced development work on its remaining ground on the west side of the railway, at shaft No. 4. It is proposed to crosscut through that strip of territory lying between the LaRose and the Nipissing. The formation is favorable, being made up of a thick layer of conglomerate.

A number of veteran employes of the Buffalo Company have been presented with a purse of $1,000 each as a mark of appreciation for service rendered while in the employ of the company. The Mining Corporation of Canada has now taken complete possession of the mine, following the purchase of the controlling interest a week or so ago.

As yet no decision has been rendered in connection with the legal points at issue between the opposing interests in the Bailey-Cobalt.

During the month of November the Kerr Lake mine produced 115,000 ounces of silver as compared with 112,000 ounces during October. The mine is maintaining its position of being the third largest silver producer in Canada.

The Mining Corporation of Canada in an official statement declares that it has been found advisable to not pay the regular quarterly dividend, ordinarily due this month, but expresses the belief that disbursements will continue early in the new year. The reason for this course is due to the company having purchased a 70 per cent interest in the Buffalo Mine as well as a lease on the Foster property. The official statement issued also deals with the fact that the company lost two and a half months' production owing to the last summer's labor strike. The indications are that the company will produce slightly under one and a quarter million ounces of silver during 1919.

The offer made by the Northern Customs Concentrator Company for the La Rose mine was not accepted, it is learned officially. The La Rose Company is understood to have not endeavored to sell its original holding, the offer being entirely voluntary on the part of the Northern Customs Company.

THE GOLD MINING CAMPS

Rapid improvement is taking place in the gold mining camps of Northern Ontario. On every hand a greater degree of activity is made manifest. While not a few industrial plants in other parts of this continent are curtailing operation due to the shortage of coal caused by the great coal strike which continued throughout the whole of the month of November, the mines of this country have been able to operate at desired capacity. This favorable situation may be attributed to the rigorous climatic conditions of the North where it is necessary to provide, months ahead, the required fuel in order to avoid the unsatisfactory delivery during the winter months. Your correspondent has followed progress in the gold mining camps of the north from the commencement of development. Reviewing the entire field there exists a greater degree of confidence than ever before in the North's history.

The number of men available is slowly but steadily increasing.

The Hollinger has succeeded in accumulating a surplus of around $3,750,000 in addition to distributing a one per cent dividend $246,000 every eight weeks. The McIntyre, in addition to paying an interim dividend of 5 per cent every four months is constantly adding to its surplus. The Dome, after being closed down and

without any surplus last spring, has declared a dividend of 2½ per cent payable January 15th next. These factors are all tending to lend greater stability to the degree of confidence placed in the leading mines.

The McIntyre-Porcupine is carrying on work on a scale more extensive than ever before. By spring a depth of over one-third of a mile will have been reached. The importance of this cannot be lost sight of. Values have increased accordingly as greater depth has been reached. What holds good at the McIntyre may reasonably be found to apply in a more or less general way to all the leading mines, in that the geological conditions peculiar to each bear marked resemblance.

The Dome is treating close to 30,000 tons of ore monthly. The mill has a rated capacity of 45,000 tons a month. Costs are said to average between $3,50 and $4 a ton, while the ore treated in recent months has averaged around $8 a ton. These figures, of course, must be dealt with cautiously. First of all, $8 a ton is above the average in the entire mine. Also, $3.50 or $4 a ton for costs is abnormal for the reason that the mill is only operating at two-thirds capacity. The fact appears to be, however, that operating at full blast that costs may reasonably be reduced to about $2.75 a ton. This would compare with about $2,50 prior to the war. Although costs of material and labor are a great deal higher at present the system of handling the ore is better, with the result that a cost of $2.75 seems a fair estimate. This being so, it would appear that in treating an average grade of ore of about $5.25 a ton, a net profit of $2.50 a ton is indicated. Treating 40,000 tons with a mill with a possible capacity of 45,000 tons a month, the net profit would approximate $100,000 a month, or $1,200,000 a year, which would be equal to 30 per cent on the companies issued capital of 400,000 shares of the par value of $10 each.

In connection with the Dome Extension, nothing of an official nature seems to be available. It is learned, however, that it is proposed to commence treating a substantial tonnage of Dome Extension ore in the Dome mill, the work to start some time this month.

The first half of 1920 is expected to be marked by the resumption of production three more important properties, namely: the Porcupine Crown, Porcupine V. N. T., and the Schumacher.

At a number of the smaller properties aggressive work will be carried on, that is at such properties as the Clifton-Porcupine, Porcupine-Keora, Gold Reef, Gold Centre, etc.

In the Kirkland Lake district, everything appears to be shaping up satisfactorily, and 1920 will probably record the heaviest production so far from that camp. The Kirkland Lake Gold Mines has recently encountered some very rich ore at a depth of 700 feet and the physical condition of the property is steadily strengthening. At the Wright-Hargreaves it is learned that with the arrival of spring the big new mill will be rushed to completion. The Tough-Oakes, it is learned officially, it is proposed to resume work in March; and by early summer the mill should be brought into operation.

At Boston Creek, a number of properties continue to be worked in an aggressive way. They include: the Miller Independence, Boston-McCrea, Peerless, Kennedy-Boston, Catherine Gold Mines, etc. Among the new operations soon to commence are the Ivanhoe-Boston and the McElroy-Hughes.

From the township of Skead prospectors are bringing encouraging reports, and the result of exploration work offers reasonable assurance that that area will be quite active during the coming year.

In the Fort Matachewan district, activity is increasing. Diamond drilling is to be carried on at least three different properties. At the Otisse the management is confident of bringing the mine to a profit-yielding basis—"Just how big it will be," said an official, "we do not know, but we are confident of success."

BRITISH COLUMBIA

The Coal Trade in the West

W. G. Gaunce, of Victoria, B. C., has been appointed fuel controller for British Columbia. This step was taken following the passage by the Dominion Government of an order-in-council prohibiting the export of coal except under license.

To obtain some idea of the condition in respect of the coal supply for domestic use, Mr. Gaunce has made inquiries at the colleries and in the different centres of the Province and finds that there is no prospect of anything approaching a serious shortage. Some weeks ago there was trouble in Kamloops, B. C., because of delay in shipments from Vancouver, B. C., but this has been overcome and the situation now is satisfactory.

What British Columbia coal can be spared is being shipped to the State of Washington, where there is a ready market. When it is proved that the local requirements have been cared for Mr. Gaunce does not hesitate to recommend that the companies be permitted to export. While the contributions from this side unquestionably are doing much to alleviate the shortage in Washington as a result of the strike, the demand there cannot be adequately supplied from this side of the line. It is not surprising, therefore, to learn that some of the mines on the American side are being operated to an extent by volunteers. One recent report is to the effect that a crew of civilians, few of whom had been underground before, went into a mine and is producing upwards of 70 tons a day.

The initiation of the federal policy in regard to licenses caused some difficulty and inconvenience among operators of small tug-boats which had been accustomed to coaling at any time fuel was required. This since has been overcome by giving such craft permission to go to the bunkers to replenish their supplies without complying with the formality of securing a license.

Mr. Thomas Graham, general superintendent of the Canadian Collieries (D), Ltd., in discussing the present condition in British Columbia in regard to the coal supply, makes the plea frequently heard that the consumer would do much to assist the producer by purchasing his winter fuel in the summer, or at least by getting over the habit of waiting until the first cold snap before placing his order. Mr. Graham described the position of the collieries as follows:

"The mines of Vancouver Island have a steady bunkering business with the steamship companies through summer and winter. A large portion of their output, however, is for domestic consumption. In order that both classes of consumers shall have a

steady supply it is necessary to equalize the summer and winter output. If the householders neglect to stock coal during the summer for winter consumption it generally happens that a severe period of cold weather in the winter will create an unusual demand for coal and the mines cannot keep up with both their domestic and bunker orders. Then they are faced with the disagreeable situation of refusing coal to those shipping companies that have made it possible during the summer months to keep the mines operating and give employment to large numbers of men. This, of course, endangers future business from such a source. In order to keep miners employed steadily throughout the year it is necessary to have a steady demand all the time and this is the reason that for years the operators have been trying to induce people to buy their coal supply months in advance."

Mr. Graham stated that 1,300 men now are employed at the Cumberland mines.

In discussing progress in first aid and safety first appliances and training in connection with the coal mines of British Columbia, credit is given the Canadian Western Fuel Co. of Nanaimo as being the first concern of its kind to take up in this Province the training of its employes in first-aid and mine rescue work. It was the first company to voluntarily install mine rescue apparatus and training stations. This was done when T. R. Stockett, of Vancouver, was general manager, and Thos. Graham, now general superintendent of the Canadian Collieries (D), Ltd., was general superintendent of the company. As well, it was the first company to use seismographs in its mines, daily readings being taken to give warning of the possibility of explosions attending seismic disturbances. The Canadian Western Fuel Co. now has organized a First Aid and Mine Rescue Association with a membership of about 200. A meeting is held each Sunday morning at which a lecture is given or paper read on some branch of mine safety work followed by addresses by medical men on first aid. Following the inauguration of the work by the Western Fuel Company, the Provincial Government passed legislation requiring that mines be equipped with safety apparatus and that employes should be trained in its use. All important mines in the Provinces, therefore, now are so provided.

In giving evidence before the Alberta Provincial Coal Commission, at its closing session held recently at Edmonton, George H. Montgomery, an operator, expressed the opinion that only British born should be allowed membership in any of the labor unions of Canada. Foreigners tended to be agitators. An amendment, he also contended, should be made to the eight-hour day law permitting overtime work and longer hours, should it be desired by the miners. He gave incidents in connection with his own experience to prove that miners frequently were willing to work overtime. O. E. Whiteside, manager of the Coleman Collieries, thought that the government should be asked to adjust the transportation difficulties. With satisfactory railroad service there was no reason why Alberta should not dominate the fuel market of Manitoba. J. R. Richards, inspector of mines, referred to the losses of coal in Alberta through the partial development of the fields. Some 43,000,000 tons had been lost through interruption of work in the mines since 1906.

Since the announcement of the Dominion Government's action with reference to the export of coal, it has been authoritatively stated that the coal of the Province of Alberta is not affected and that the collieries of that Province will be delighted to fill all orders possible coming from the other side of the line. It is pointed out, in this connection, that the mines of Alberta have an annual capacity of 13,000,000 tons and only 8,000,000 tons are used. Shipments accordingly are being made to the South. An order of 1,000 tons of steam coal for the industrial plants of Great Falls from the collieries of Lethbridge is one instance of this of which public notice was given.

METAL QUOTATIONS.

Fair prices for ingot metals in Montreal as at December 8th, 1919:—

:-: EDITORIAL :-:

Our Coal Problem

The Toronto "Globe" says editorially: "The report that Nova Scotia coal will be shipped to Ontario will scarcely bear analysis. The railway rate from the mines in Cape Breton to Toronto would be about $7.40 a ton. From Pittsburg to Toronto it is $3.50. Steam coal from the United States sells in Toronto for about $6.25 per ton, or a dollar less than the railway charges alone upon the Nova Scotia product. Even if Cape Breton coal were hauled for nothing it would cost almost as much as the United States coal laid down in Toronto."

Let us examine this statement. In the first place, there are coal mines in Nova Scotia which are much nearer to Toronto by rail than the mines of Cape Breton. The Cumberland coalfield is almost 250 miles nearer Toronto than the Cape Breton mines. There is no need to contemplate the hauling of coal by rail, except in a national emergency like the present, but supposing for argument's sake it were done, there would be one advantage in that all the money expended in wages and materials would be spent in Canada and not given to the railroads of the United States. Moreover, it may be pointed out that the cost of the rail haul from Pennsylvania to Toronto is not a purely competitive haul. It is a fortuitously cheap rate, made by the United States railroads to provide an outward freight for cars coming to Great Lakes ports to load iron-ore, which otherwise would make the journey towards Canada unloaded.

The largest tonnage of Nova Scotian coal shipped by water to Montreal in past years was slightly under two million tons, but that quantity did not by any means exhaust the possibility of water shipments from Nova Scotia. The production of coal in Nova Scotia, but for certain unfortunate tendencies, could by this time have reached ten million tons annually, and not two millions, but five millions of tons could have been available for water shipment up the St. Lawrence. Given sufficient men, sufficient ships and additional unloading capacity at St. Lawrence ports, there is no inherent difficulty in shipping five million tons of coal or more from Nova Scotia to Montreal and points further west.

The coalfield of Pictou is within a half day's rail-haul from Halifax, and there is not the slightest reason why Halifax should not become just as important a coal-loading port as Sydney, Cape Breton. Similarly, the port of Parrsboro is within 40 miles of the Springhill Mines, and this port is already equipped for loading coal cargoes to a much larger tonnage than has yet been attempted.

There seems to be a settled idea that somewhere about Brockville, Ontario, exists a western limit to the competition of Nova Scotia coal with United States coal, but this is a matter that has never been recently tested. While it is unfortunately true that the cost of coal production in Nova Scotia has greatly increased during the war, it is equally true that a great deal of this increase is due to reduced production. While the capacity of the existing coal mines in Nova Scotia for output is gravely decreased, it cannot be suggested that the limit of possible production of coal in Nova Scotia has either been reached or attempted. It certainly has not.

It may be soberly stated that the economic possibility of sending Nova Scotia coal to points west of Montreal has not even been examined, let alone tested, under the changed conditions brought about by the war.

Toronto people may rid themselves of any idea that they will ever again be able to buy United States coal —unless it be a refuse and dump product—for $6.25 per ton laid down in Toronto. The cost of coal production in the United States has undergone the same processes of increase as have taken place in Nova Scotia and in Europe, and on top of these come the new increase of at least fourteen per cent, plus the certainty of reduced hours of labor and a smaller production per man. Also, it was significantly stated by the United States Bureau of Mines recently, that the production of coal from seams three feet under in thickness, during the last mines year, was 20,000,000 tons. This is one proof amongst many that the United States coal seams have been picked over. No actual shortage of coal is to be feared in that richly endowed country for many generations, but the most accessible, the thickest and most cheaply mined seams have been very appreciably depleted. An annual coal production of between 700,000,000 and 800,000,000 tons leaves a hole in the ground.

In short, United States coal is on an altered competitive basis, and Canadian coal producers cannot be said to have yet tested that basis.

The Toronto "Globe" puts forward no argument for the use of United States coal but that of lesser cost when compared with the Canadian material. This argument would be quite a proper one were Toronto in the United States, but there are two sides to this matter. Canada could supply herself quite comfortably with at least ten million tons of bituminous coal annually in excess of the tonnage of Canadian-mined coal now used in Canada. At the low price of five dollars per ton, this tonnage would represent $50,000,000 that is now spent in the United States, that could and should be spent in Canada, which is equivalent to unnecessarily increasing our adverse trade balance by $100,000,000 per annum. This is one of the reasons why Canadian funds are at a discount of eleven per cent in New York at the time of writing.

When the increase of wages taken by the bituminous coal workers in the United States has been applied to the cost of coal to colliery fires, to the manufacturing costs of the materials that enter into the production of coal, to the cost of railway freights, and has come again full circle to the coal-miner's living costs, it will be found that fourteen per cent is but a fraction of the ultimate increase in the cost of United States coal in Toronto.

If the manufacturing interests of Central Ontario say—without further enquiry—that they cannot possibly use Nova Scotian coal, because it costs too much; and if, on the other side, the coal operators of Nova Scotia do not vigorously attempt to regain their old St. Lawrence markets, and extend them further, as the altered competitive basis suggests they could if they tried, then Nova Scotia will see its coal trade still further decline, and Toronto and its environs will become still more the economic vassal of the United States.

It is not correct to state that the extension of the market for Nova Scotia coal will not bear analysis. It will both bear and repay the closest analysis, and the day is coming when the use of Nova Scotia coal in Toronto will be an accepted commonplace.

Miner's Lamps

A correspondent of the Maritime Mining Record suggests that consideration is being given by the larger coal companies in Nova Scotia to the use of the cap type of electric miners' safety lamps, a very natural development from the great strides that have been made in recent years in the perfection of the electric lamp for the use of miners, and more particularly coal miners.

Recently the Editor had an opportunity to visit some of the collieries in Vancouver Island and was struck by the fact that the old safety-lamp had been entirely superceded by the cap type of electric lamp, except for the use of gas-testing by officials. It was a revelation in comfortable vision underground to walk behind a party of men wearing these lamps, and not to experience the discomfort of walking behind a collection of dazzling and bobbing points of light.

In the Nova Scotian collieries, since the introduction of safety lamps some fifteen years ago, there has been an appreciable increase in the number of cases of nystagmus. This affection of the eyes of miners has been assigned to various causes, but the concensus now is that it is caused by deficient illumination, or, more specifically by the effect of a concentrated pin-point of light surrounded by complete darkness. Relief has been experienced from the white-washing of large areas of the mine roads, which does not increase the illumination present, but avoids the painful contrast between a point of brilliant illumination and the surrounding darkness. Two advantages in the electric cap-lamp are the greater illumination it affords, and the fact that the light is thrown in front of the eyes of the wearer without shining directly into the eyes. A third advantage is that previously mentioned, when men are walking underground in single file, as they so often have occasion to.

From the point of safety, the electric lamp is distinctly superior to the ordinary oil lamp. The writer was told by the superintendent of one of the Western collieries that the number of accidents among men engaged on the haulages has materially decreased since the electric cap-lamp was introduced, as its use permitted the wearer to have his hands free, and he was not distracted from his work by necessity to handle his safety lamp with great care for fear or losing his light. With the cap type of safety lamp, there is no necessity to hang the lamp on a prop or other handy support, or to place it on the ground, both of which practices lead to broken glasses and other damage to oil safety lamps, with consequent danger from exposure of the naked flame to the atmosphere of the mine.

The electric lamp also requires no oxygen for flame combustion, and gives off no combustion products to the mine air. This is an important matter, and will be specially important in submarine mining when the faces reach out to sea to a distance requiring auxiliary forms of ventilation current and supply.

One colliery in Nova Scotia is already supplied with the electric cap-lamp, with very satisfactory results. It will not be surprising to hear of the adoption of electric safety lamps in all new collieries, and the

gradual replacement of the oil lamp by electric lamps in the older collieries.

The question of gas detection should impose no obstacle to the introduction of the electric lamp in a properly organized colliery, and in most cases it will be a distinct advantage to have it clearly understood that the official who is charged with the duty of making observations for the detection of inflammable gas is the only person on whom this responsibility is imposed. The presence of monoxide cannot be detected by an oil light. The presence of carbon dioxide should not be looked for in any modern and well ventilated mine, but all the requirements of gas detection in the mine air can be fulfilled by the use of a limited number of oil safety lamps in the hands of properly appointed and qualified officials.

Scotia Acquires Control of Acadia Coal Company

The official announcement that the Nova Scotia Steel & Coal Company has acquired the controlling interest of the Acadia Coal Company, and will now enter into the management of the properties and mines of that Company, is of very great interest to the coal trade in Nova Scotia. It is an encouraging event, in a good many respects, but not the least hopeful feature which is disclosed by this extension of the Scotia interests, is the progress made towards a realization of the chief need of the coal business in Nova Scotia, namely, a consolidation of coal properties and interests. A number of years ago the writer formed the definite opinion that any stability or prosperity which had been achieved in connection with the coal mining activities of Nova Scotia was the result of a consolidation of interests, and that any future progress could only take place as an outcome of further consolidations. Later events have served to confirm this opinion.

The acquisition of the collieries of the Acadia Coal Company by Scotia will enable some notable economies to be effected by the use of electricity as a motive power, in substitution for the existing steam drives, at the Trenton works of the Scotia Company. It is not generally realized by coal-mining circles in Nova Scotia, what a well-designed, modern and efficient power-plant the Acadia Coal Company possesses at the Allan Shafts at Stellarton. A description of this plant has appeared on several occasions in the columns of this Journal. It may be taken for granted that full use will now be made of the capacity of this plant for the generation of power that can be transmitted with little cost to the Trenton Plant, which is within sight of the Allan Shafts.

The possibility of the acquirement of the Acadia properties by the Scotia Company has for some time been a live topic in the County of Pictou, as it has been presumed, and correctly presumed, that such a consolidation forecasted the permanence of the steel-working industry at Trenton. Steel manufacturing processes are always an outgrowth of the possession of coal, and popular opinion in New Glasgow has been correct in associating such a consolidation as has now taken place, with much promise for the future stability of a district that was felicitously named New Glasgow, and has endeavored with marked success to emulate its larger namesake on the banks of the Clyde.

Christmas, 1919.

The Editor takes this opportunity to wish the readers of the Canadian Mining Journal a very Happy Christmas. Taking things large and by, the members of the mining community of Canada, which paradoxically enough, is an unusually scattered and at the same time an exceptionally united one, has much to be thankful for.

The material rewards which have come to miners during 1919 have not been inconsiderable. Our men —except such of them as will not come back—are home from the war, and are, for the most part, back in harness. The year has been marked by much new discovery and testing of not fully known mineral areas. The well-grounded belief of the mining engineers of Canada in our country's latent mineral resources has been strengthened.

The Canadian miner, better than any other man, knows that we possess a good land and a vast one, because he has usually seen it first. He may be regarded as an incurable optimist, but usually he knows whereof he speaks. To its readers, in scattered camps, in a land that stretches "From Sea to Sea, and from the Great Waters to the Ends of the Earth" the "Journal" extends its heartiest and seasonable greetings.

Newfoundland's Coal Areas

By E. D. HALIBURTON, Port-au-Port, Newfoundland

For many years coal has been known to exist in Newfoundland, but until twelve months ago no serious attempt was ever made to prospect, much less to mine these coal deposits. Within the past year two companies have begun operations, though as yet they have exerted themselves rather in prospecting than in mining, and although the existence of large deposits of workable coal seems probable, enough work has not yet been done to make the probability a certainty.

The more promising of these areas is that owned by the St. George's Coal Fields Co. This is a local Company capitalized at $500,000, the shares being owned mostly by Mr. Thomas J. Freeman of St. Johns', in payment for the property. It lies about ten miles from the coast and seven miles from the Reid Newfoundland Railway, between the Robinson and Middle Barachoix Rivers, and consists of four square miles of level, thickly wooded country capable of supplying pit-props and building material for a long time. On this area sixteen seams have been located and it is reasonably certain that others exist. The four principal seams are: The Juke's, the thickness of which, measured at right angles to the roof varies from 4 ft. 8 inches to 6 feet; the Howley, 4 ft. 2 inches; the Cleary, 2 ft. 2 inches; and the Murray, 5 ft. 4 inches. The coal is of a very good quality, bituminous, and free from sulphur and there is one small seam of cannel. The associated strata consists for the most part of a greenish grey sandstone.

Computations based on the known outcrops alone.

Map showing the Carboniferous Areas of Newfoundland

Taken from "Coal Resources of the World."

place the amount of coal present at over one hundred million tons, but so far the company has not been financially capable of employing a drill to aid in corroborating these figures, though it is hoped to do this next Summer.

The Jukes seam has been partially opened up by the efforts of half-a-dozen miners who have been working there for the past year. Practically none of the other seams have been touched. The Jukes seam strikes north and south, and dips east 52 degrees. About a thousand yards from its outcrop in the river bank, it is cut transversely by a deep gulch and from the bottom of this gulch the men have tunnelled into the coal along the line of strike, 165 feet towards the north and 150 feet towards the south. Throughout this distance the dip and strike continued perfectly uniform. The floor of the seam consists of hard rock with a thin layer of fireclay between it and the coal and about six inches of debris had to be cleared away to get a solid roof cover. The men are now sinking a shaft some distance to the north in an endeavor to locate the seam again. It is so situated that a great part of it could be stripped of its cover and mined opencast for a long time; and in other cases by shaft and levels, driving heads uphill and letting down the coal to the main level, where it could be hauled in trucks to the shaft.

It is believed that these seams are the western outcrop of a large synclinal basin of coal which outcrops again about five miles to the north-east. According to maps and reports drawn up by the late Alexander Murray and James P. Howley, F.C.S., this basin is shallow, the depth from the surface to the trough of the syncline probably not exceeding one to two hundred feet, and the dip of the seams consequently being gentle. The area occurs in a great, level expanse of undisturbed country, which would imply that the coal beds ought not to be seriously faulted or disturbed.

Commercially the locality is not inconvenient. It would not cost very much to make "Crabbes," ten miles to the west a good summer port, and "La Poile," forty miles south is a splendid harbour open all the year round.

Lack of financial backing prevents the present development of these areas, but it is hoped that within a few years Newfoundlanders will realize the value of latent wealth and heat lying dormant there and invest sufficient capital in the Company to develop the coal deposits and thus supply the island with its own coal. The Government is doing its utmost to encourage the company and has granted them many valuable concessions, besides binding itself to pay a bonus of one dollar on every ton of coal produced.

Reid's Coal Fields.

The other coal deposit is at South Branch on land owned by the Reid Newfoundland Co. It is divided by a ridge of mountains, and lies about thirty miles southwest of the St. George's Coal Fields, being also about ten miles from the coast.

This deposit is so far known to consist only of a single seam from twelve to twenty-two feet wide, which dips vertically. It is situated in more or less disturbed country. A mountain of igneous rock rises near the mine and leads to the belief that a batholith once forced up these coal measures to be eroded later during the glacial period. The facts can only be disclosed by actual development work.

Last winter about one hundred men were employed by the company, and about three thousand tons of coal was mined by the overhead method, a slope being drifted into the hill along the strike. This coal was hauled to the railroad about four miles away, by teams. At present twenty men are employed and they are sinking a prospecting shaft which is 120 feet deep, at which depth the coal has become much harder, while the width and dip remain the same.

Mining activities of the Reid Newfoundland Company, now come under a newly formed department of that company, known as the Newfoundland Development Company, at the head of which is Mr. Forbes, M.E., and associated with him is Mr. Hatch, Mining Geologist, well known in the Cobalt District.

WINTER MINING COURSES FOR PRACTICAL MINERS AT THE COLLEGE OF MINES, UNIVERSITY OF WASHINGTON

The College of Mines, University of Washington, Seattle, advertises courses in Quartz Mining, Placer Mining and Coal Mining, from January 5th—March 25th, 1920. The expenses consist of a fee of ten dollars and laboratory deposits for materials actually used by the individual students. Ex-service men are exempt from the fee of ten dollars. No previous training is asked from entrants, who are merely required to be able to read and write English.

The courses offered are as follows:

Quartz Mining

Flotation and Gravity Concentration.
Ore Mining Methods.
Asssaying for Gold, Silver, Copper, Lead, Tin, Antimony and Tungsten.
Geology and Mineralogy.
Mine Surveying.
Chemistry.
Mining Law.
Forge and Foundry.
Mine Timber Framing.

Placer Mining

Testing Placer Ground.
Hydraulics.
Dredging for Gold.
Melting and Refining.
Surveying.

Coal Mining

Analysis of Coals.
Surveying.
Lamp Testing.
Mine Rescue and First Aid Training.
Coal Washing Methods.

The College of Mines is to be congratulated on its enterprise. There is no greater educational need today than to bring the faculties of our large universities into actual contact with the worker at his work. Happy is that mining district which is situated sufficiently near to a university to permit of the extension of its teaching activities to men actually engaged in mining.

The university extension idea is a good one, and we do not think it is possible to overdo the extra-mural work of the modern university.

COUNTRY ROCKS OF ELLIOTT PITCHBLENDE DEPOSITS.

By R. E. HORE.

Some descriptions of the pitchblende deposit in Butt township, Ontario, have been published in the Mining Journal. I have recently had occasion to examine more closely some of the rocks collected when I visited the deposit, and am submitting a few notes for publication, as they may be of some use to others.

The pitchblende bearing feldspar-mica-quartz dyke where exposed at Elliotts' discovery lies against a medium grained gray rock. It is made up largely of nearly colorless grains of feldspar and quartz; but has regularly distributed through it a very large number of crystals of dark minerals—biotite and hornblende. The mica is more conspicuous and more easily identified than the hornblende, but the latter is quite abundant.

Microscopic examination shows the hornblende to be of a rather unusual variety. It is blue in color, while the common hornblende is green in thin sections. Most of the mica crystals show the brown pleochroic colors of biotite, but there is also present some pale green muscovite. The rock is for the most part unaltered, but there are some small areas of secondary minerals—chiefly carbonates.

The hanging wall rock is not exposed at the Elliott deposit. An outcrop at the outlet of the lake has an unusual appearance, the rock having a decidedly brownish color, even when freshly broken. It is a finely granular rock and the mineral constituents are scarcely determinable without a microscope. The cause of the brownish color of the light colored minerals is at once evident under the microscope. The feldspar and quartz are in very small crystals and scattered through the aggregates of feldspar and quartz are very numerous minute grains of a mineral resembling hypersthene. It is pleochroic, being of pale gray color in some positions and pale pink in others, varying in color according to the direction of light vibration. It would doubtless appear as a dark brown mineral by reflected light when examined in the ordinary way by the naked eye. The most prominent constituent of the rock is hypersthene, of which there are abundant crystals similar in character to the small grains which occur in the feldspar aggregates. There is also present some strongly pleochroic brown hornblende.

The area in which the Butt pitchblende deposit occurs forms part of the great Pre-Cambrian crystalline formations generally described as granite gneisses. The rocks examined are, however, not the common types, and their unusual character may be of some help in exploration.

METAL QUOTATIONS.

Fair prices for ingot metals at Montreal, 17th December 1919.

	Per lb.
Electro copper	24½
Castings Copper	24
Lead	8½
Tin	60
Zinc	10⅜
Antimony	11
Aluminum	33
Steel Bars (nominal)	$3.10
Plate (nominal)	$3.35

CANADIAN MINING INSTITUTE.

This Dominion possesses no organization of greater practical importance or of greater potential usefulness than the Canadian Mining Institute which held its annual convention in Vancouver recently.

In the nature of the case, there must be a good deal that is technical in the discussions, but there are also many questions coming up which are of deep interest to the public at large. A cordial invitation is extended to all who may wish to be present, and it is hoped that many will take advantage of it. They will have a chance of learning a good many things that may prove profitable as well as enlightening.

Among the matters the Institute will have under consideration is the advisability of "going into politics." By this they do not mean the advisability of trying to elect anybody in particular to parliament or legislature. What they suggest is the exercise of a non-partisan influence for the development of the mining industry. The idea that they could do valuable service in this way, sounds reasonable.

From time to time there has been talk of forming a Western Institute, owing to the difficulty of holding meetings at points so far apart as here and Montreal. Hitherto, however, the benefits of a common organization for the whole country have been felt to outweigh any incidental inconveniences, and it is believed that this view will continue to prevail.—Vancouver "Sun."

INSTITUTE MEMBERS AT BRITANNIA BEACH.

On Saturday the members of the Canadian Mining Institute to the number of about thirty, including students from the mining department of the University of British Columbia, and several S. C. R. men, visited Britannia Beach, where they were shown over the mill, hydro-electric and compressor plants by Mr. Browning, general superintendent, asissted by Mr. Peterson, superintendent of transportation, Mr. Lee, mining engineer, and Mr. Hughes, mill superintendent.

The method of operation was fully explained by Mr. Browning, and Associate Professor Gillies took the students through the details of the operation. After an inspection of the mill, plants and townsite the party met at the company's offices, where they tendered a vote of thanks to Mr. Donohue, assistant manager, and the officials who had entertained them.

High appreciation was expressed of the enterprise shown in the development of the Britania mine and its equipment, and of the patriotic work done at Britannia Beach during the war. Dean Brock and Mr. H. Mortimer Lamb, secretary of the Canadian Mining Institute, were appointed a committee to draft a letter of thanks to the company for the information afforded the visitors by the inspection of the plant; conveying to Mr. Moodie, the general manager, their admiration of the remarkable enterprise which they had seen, and the efficient manner in which it had been carried out; also conveying to Mr. Moodie, the sympathy of the Institute in the family bereavement which prevented him from being present on the occasion.

Three cheers and a tiger were given for the company and its officials. The visitors were then entertained to dinner by the company and left at 6 p.m. on the return trip to Vancouver well satisfied with the day's outing. —Vancouver "World."

Further Notes Regarding the Vancouver Meeting of the Canadian Mining Institute

A party of C. M. I. members took advantage of the trip to the Cassidy Mines of the Granby Consolidated Smelting Company which the local committee had arranged, and escorted by Mr. Thomas Graham, general superintendent of mines of the Canadian Collieries (Dunsmuir) Limited, visited the Cassidy Mine on Sunday, the 30th November, where they were met by Mr. E. G. Wilson, the superintendent of the Granby Company at Cassidy's.

The party included Capt. W. A. Richardson of Courtney Bay, Mr. G. H. Kilburn of Trail, Mr. Dudley Michell of Edmonton, Mr. W. R. Wilson of the Crow's Nest Pass Coal Company, Mr. Brewer, resident engineer of the Mines Department, Mr. F. W. Gray, editor of the C. M. Journal, and Messrs. McPhee, Gilchrist, Hailyard, McKechnie and Dixon, students from the University of British Columbia.

The party first visited the No. 1 Colliery of the Western Fuel Co. on Nanaimo Bay, the oldest and the most consistently successful coal mine on the Island, where they were shown round the surface by Mr. Stirling, the general manager. The workings of this colliery are entirely submarine, and a unique feature is the man-shaft on Protection Island. Coal is being mined both from the Newcastle and the Douglas Seams.

From No. One, Nanaimo, the party motored to Cassidy's, where they inspected the unique plant recently completed there by the Granby Company, and previously described in the Journal. Unfortunately, the boiler inspector was at work, and the steam being off, it was not possible to inspect the workings of the mine. The lunch given to the visitors was most excellent, and the brand of pie manufactured at Cassidy's was voted to be as fine as the plant, and that is "going some." The situation of Cassidy's is beautiful by nature, and unspoilt by art. Superb timber occurs all around, and the plant is situated in a natural amphitheatre or alluvial flat, flanked by a heavily wooded hill which goes up rapidly for 300 feet. In a gorge below runs the Nanaimo River, a stream of deep green clearness, with steep banks covered with fine trees, hart's tongue ferns, and luxuriant bracken. The writer, after listening to Mr. Wilson's description of the colliery and its buildings, remarked that it sounded like the description in the Apocalypse of the City Beautiful close by the river of crystal, but actual inspection of the site proved a pleasant surprise, even after the written description had given some idea of what to expect.

On the return journey, the party were taken by Mr. Graham, who acted as the guardian and mentor of the visitors, to No. 5 Colliery of the Canadian Collieries, where the workings were visited. The nature of the coal occurrence is distinctly different from any of the eastern occurrences, and one would imagine that a thorough knowledge of local geology and some acquaintance with the earth movements was a first essential to successful coal mining in Vancouver Island. The visit was in the nature of new knowledge to most of the party, and was thoroughly enjoyed—even if it did snow on the way home.

To eastern eyes, a feature of the Vancouver Island collieries is the use of electric head-lamps, of the Edison type, in preference to the oil safety lamp. The advantages of this type of lamp cannot be denied. The use of Marcus screens and devices to lessen coal breakage seems general, and a particularly handy arrangement was the use of a small motor for raising and lowering the apron that drops the coal into the railway cars. Two items of equipment that interested the writer were a gravity-operated, three-car tipple at the No. 1 Nanaimo Colliery, and a coal-washer of the Robinson type, similar to one that used to do fairly good work for the Dominion Coal Company before it was destroyed by fire.

Another thing that struck one coming from a country where timber is small in size and costly in price, was the lavish use of excellent timber in the Vancouver Island collieries. Also one was struck by the evidence of a climate so mild as to permit washeries and other places where water was used to operate in the open air without enclosure or danger of freezing. No protection from the weather seemed to be necessary, except protection from rain. It was not possible for the party to visit the mines further up-country, but sufficient was seen by the party, thanks to the assiduous courtesy of Mr. Graham, Mr. Wilson, and other mining gentlemen in the Island, to make the journey very pleasant and informative.

One was interested in the evidence of the anticline that shows in the rocks near the old Hudson Bay Bastion near the waterfront of Nanaimo Harbor. The bastion itself is a fine relic of former days, which it should be the pride of the citizens of Nanaimo to preserve, and it was therefore extremely surprising to read in a Vancouver paper that the bastion was likely to be sold for taxes, and destroyed if these continued in default. One can with difficulty believe that such a proposal would be seriously made.—F.W.G.

No. 1 Shaft of the Western Fuel Co., Nanaimo, Vancouver Island, B.C.

A FLOOD OF TECHNICAL PAPERS.

At the technical meetinge held at Chicago in the last week of September, probably a record was made in the number of papers presented on iron and steel subjects alone, saying nothing of those in other lines. At the sessions of the American Institute of Mining and Metallurgical Engineers at least 24 papers on iron and steel were presented, besides a half dozen on steel and allied subjects before the American Electrochemical Society and the Exposition of Chemical Industries, a session on pyrometry alone, lasting a whole day, had an array of 53 papers, of which 35 were presented by the authors or their representatives. Thity-nine papers, of which 14 were read by title only, were offered at the technical sessions of the first convention and exhibition of the American Steel Treaters' Society.

In all, at least 120 papers on iron and steel and allied topics were scheduled for the three Chicago conventions. A week later at Philadelphia American foundrymen were offered a total of 42 papers, spread over four days of sessions on iron and steel foundry problems. This summary does not include 19 papers on the program of the American Institute of Metals for sessions in conjunction with these Chicago and Philadelphia meetings.

While many papers in these long lists were of a high order of merit, the question arises whether the effort to produce a large volume of literature for every such meeting has not been overdone. From those who attend the remark is often heard that there is too much to absorb. It can hardly be contended that any subject is so important that 53 papers should be scheduled for consideration at a single meeting.

The matter is serious enough to suggest to the managers of these various societies whether programs should not be curtailed, perhaps decidedly. It is generally conceded that two important benefits should be the result of such meetings—a discussion of papers and an interchange of views and the making of new acquaintances. In many cases at Chicago, where sessions were held morning, afternoon and evening, though not so much at Philadelphia, programs had to be rushed through, affording inadequate time for fruitful discussion. The papers can be read by the members at their leisure in most cases, many of them before the sessions, but the real benefit is the exchange of views on the floor of the convention. In most cases discussions of prominent papers should have several leaders pre-arranged for. Too often an excessive amount of time is consumed in presenting the papers. There is danger that this really vital part of the work of our leading technical societies may be made ineffective through straining after volume, unless some reform is instituted.—"Iron Age."

Note:—This editorial from the "Iron Age" of 27th November, is interesting corroboration, from a United States source, of the similar views expressed in the "Journal" of the issue of 26th November.—Ed.

PERSONAL.

James P. Flynn, M.E., has changed his headquarters. his office now being on the fifth floor of the C. P. R. Building, Toronto.

TORONTO NOTES

Proposed legislation to define status of the Engineer. Mr. Tyrrell goes to England...Notes from the Ontario Capital.

(Staff Correspondence.)

On November 28th the Toronto members of the Institution of Mining and Metallurgy of Great Britain dined together at the National Club and continued an informal meeting after dinner. It was decided, on the consent of the parent Institution being obtained to form an Eastern Canadian or Ontario branch to discuss matters connected with the general welfare of the profession of mining engineering in Canada. Mr. J. B. Tyrrell, who is just leaving for England was asked to submit the matter to the Council of the Institution in England. Those present at the meeting were Dr. Miller, Provincial Geologist and Messrs Tyrrell, Guess, Haultain and Segsworth. A number of other points conected with the welfare of the organization were also discussed before the meeting adjourned.

When Mr. Tyrrell returns to Canada in February he will go out to the Gabrielle property in Eastern Manitoba, Rice Lake District, the Gabrielle Mining Company having asked him to direct the development of the property. Gabrielle was the first property located in the Rice Lake District. They have two very good looking veins and there has been some work done on the property of which no records have been kept. A number of assays have been taken, all of which show good values. As the veins appear to be worth systematic development Mr. Tyrrell has accepted the position of consulting engineer and will also direct the development work when it is started.

It is stated that the Mining Corporation of Canada are surveying and erecting buildings on their pitchblende property in the township of Butt preparatory to active exploration. The Elliot Syndicate of Chicago, the discoverers of this ore of radium, are also going ahead vigorously and assays obtained by them are said to show 600 milligrams of radium per ton of pitchblende, together with 70 per cent uranium oxide. This oxide is now worth $3 per pound. It is not, however, know how much pitchblende can be obtained from each ton of rock. The mineral is in small particles scattered through the pegmatite. Owing to the weight of pitchblende, which is about four times greater than the rock in which it is found, concentration is comparatively easy. It is pointed out, however, that the values given are for the pitchblende when removed by concentration. It will probably require many hundreds of tons of pegmatite to give one ton of pitchblende.

A meeting of the Toronto branch of the Canadian Mining Institute was held on Saturday, December 6th when the following executive committee was elected: C. E. C. Smith, chairman; J. H. Black, D. A. Dunlap, H. E. T. Haultain, R. E. Hore, H. L. Kerr, James McEvoy, W. G. Miller, W. E. Segsworth, J. B. Tyrrell, A. J. Young. The meeting, which was a representative one, unanimously decided to nominate O. E. S. Whiteside for president for the term commencing after the next annual meeting. There was considerable discussion on the proposed legislation to define the status of the Engineer and it was resolved that the chairman should appoint a committee to draft a bill applicable to Mining Engineers.

ANOTHER SOURCE OF SULPHUR.

For some time there have been occasional suggestions, more or less practical, for the utilization of the vast amount of sulphur dioxide which is annually wasted in connection with the use of the sulphide ores of Ontario. A method of utilization of this gas which gives every promise of success is reported to be in operation in connection with the Tacoma Smelter in Washington. The sulphur dixoide is liquified and since in this condition it is quite readily separated from air and other gases it can be placed in suitable containers and shipped to sulphite mills within reasonable distance.

The only places so far considered as a source of sulphur dioxide gas from Canadian mills that until last week had come to our attention were the operations in the Sudbury district of Ontario. The mills which are likely to find it most convenient to use liquid sulphur dioxide are those of the Spanish River Pulp and Paper Mills, Limited, although it is possible that other Canadian plants may find it possible to do so. Within a fairly short and direct shipping distance of Sudbury we find the three mills of the Spanish River Company, the three sulphite mills in the Niagara district, the new Kipawa Fibre Company at Temiskaming and possibly even the Abitibi and Mattagami Mills near Cochrane.

It was our pleasure a short time ago to hear a paper read at a meeting of the Montreal section of the Society of Chemical Industry on the "Zinc and Lead Deposits of Gaspesia." It appears that there is a particularly rich deposit of blende and galena in a vein which has outcrops almost in the centre of the Gaspe Peninsula. If these ores are transported to some point on the Baie des Chaleurs to the south to be smelted there would be available for cheap transport a considerable amount of sulphur dioxide gas. From an operation handling 100 tons of lead per day we should have available about ten tons of sulphur dioxide or the equivalent of about five tons of sulphur. If this were depended on as the entire sulphur supply for a pulp mill it can be seen that at ordinary rates of consumption such an amount would satisfy a mill making only about 20 tons of pulp, but if used simply for strengthening the acid in a sulphite plant it is impossible to predict how large a plant could be served because of lack of information on the amount of strengthening that would be possible or necessary.

These points are mentioned because in the discussion of the paper it was suggested that the sulphite industry would furnish a market for a by-product of the mines in the manner indicated. No doubt the development of these deposits will in time make larger amounts of sulphur available in the form of liquid sulphur dioxide, and if the smelters are located on tide water there are a number of mills which can very easily be reached by transporting the gas in tanks loaded on scows. In the immediate vicinity there is the mill a Chadler and it would not be a very serious matter to tow the scows to Bathurst and Chatham and they might even be moved up the Saguenay to Ha! Ha! Bay and Chicoutimi. If tank cars were used it would then be possible to reach the Nashwaak mill at St. John, N. B., the Fraser mill at Edmundston and many others in Eastern Canada. It is likely to be some time before such an extensive market will be served, but it is interesting to consider possibilities.—From "Pulp and Paper."

PRODUCTION OF HELIUM IN CANADA.

Eugene Coste, President of the Canadian Western Natural Gas Light and Heat and Power Company of Calgary, who was in Toronto this week, declares that Helium, which will shortly be produced in commercial quantities in Canada, may now be safely added to the Dominion's long list of natural riches as an established fact. Its value as a non-inflammable substitute for the hydrogen gas now used in dirigible balloons, thus practically rendering the danger to airships from fire negligible, is still further enhanced by its scarcity. Canada and the United States being the only countries in which it is found so far, Canada having the advantage in the matter of ease of extraction from the other gases and thus, also, of cheapness of production. Following the discovery made some years ago that helium was a constituent of certain natural gases found in Canada and that it itself was an inert non-inflammable gas, lighter than air, said Mr. Coste, it was brought to the notice of the British Admiralty by Professor J. C. McLennan who was on the Research Board of that body during the war. If at once became the subject of detailed investigation and experiment by the British authorities who, working in conjunction with Mr. Coste's company, erected experimental plants at Calgary. The United States Government, immediately after the entrance of that country into the war, begun similar work near Fort Worth, Texas, where three plants, costing $1,098,000, were erected for the purpose of discovering the possibilities of the gas both as to the uses to which it could be put and the quantities in which it could be produced. Both Governments were convinced that it was an exceedingly valuable commodity for war purposes, as balloons changed with it had nothing to fear from incendiary bullets and projectiles, which were the menace of British airmen in lighter-than-air craft, and which were also the means of bringing many a German Zeppelin to the ground.

Experiments having proved that it could be produced in sufficient quantities, plans were under way to utilize it in the theatre of war and had proceeded so far that when the armistice was signed 200,000 feet enclosed in high-pressure cylinders were on the docks at New Orleans awaiting shipment to the war zone.

Experiments are now being conducted at the University of Toronto to discover if there are other uses to which helium can be put than solely as a buoyancy producer for lighter-than-air craft. Once the commodity is being produced in commercial quantities which Mr. Coste says will shortly be the case, aviation companies which are now in process of organization will be able to assure their patrons of perfect freedom from the danger of fire.

The triumph of the U. F. O. party in the Ontario elections is an expression of class consciousness. If the U. F. O. seeks to use its powers to benefit only the farmers it will fail, as all power founded on selfishness and class assertion will ultimately fail. History and Christian philosophy are very specific on this point.

The Ontario elections reflected more than anything else a revolt of the country mice against the town mice. All the same the history of the country visitor in town, according to the fable, has its warning lesson

The Latent Iron-Ore Resources in Canada Lying North of Lake Superior

By J. J. O'CONNOR.

A country that is developing with the rapidity that Canada is to-day, and that is five years in arrears with all kinds of constructive development, into which iron enters so largely, and is dependant on imported ore for 95 per cent of its furnace supplies, is in an economic condition that should not be allowed to obtain any longer, particularly if we consider the vast deposits of low grade, beneficiable ores lying undeveloped in Northern Ontario.

It has been demonstrated on a commercial scale—but only after long and very costly experimentation—that low grade Canadian ores can be converted into the highest grade of ore, by various treatments, which may be collectively referred to, as beneficiation. Of beneficiable ores there are immense quantities. The prospected parts of Canada, more especially northern Ontario, are known to contain many millions of tons of these ores at points accessible by rail. Estimates, based upon diamond drilling, place the quantities of ore in certain northern Ontario deposits at figures ranging from 100,000,000 tons downward. In other provinces there are similar, though less definitely measured, possibilities.

In the district of Thunder Bay alone, an extensive range of iron bearing formation runs from Steep Rock Lake to Kaministiqua,, a distance of one hundred miles, and another belt from the east shore of Lake Nepigon, to Long Lake, a distance of sixty miles. Further outcrops of similar ore are found on Hunters Island, Little Pine Lake, north of Dog Lake, and Kawashkagama north east of Lake Nepigon. A rough estimate made by the United States Geological Survey of these ranges computes that they contain some 9,000,000,000 tons which would run 35 per cent iron content or better.

The ores are largely banded jaspilites, with intimate mixtures of specular ore or magnetite, with jasper, and depend upon some form of concentration to make them marchantable. It is also reasonable to assume that when extensive exploration by diamond drilling is inaugurated throughout these ranges, bodies of higher grade concentration will be found. Diamond drilling, at present under way, on the range east of Nepigon, has already disclosed large bodies of high grade ore, where nothing but lean jaspilites showed on the surface.

In this connection it may be pointed out that only about 50,000 feet of diamond drilling has been performed on the range of Thunder Bay district, as against some 7,200,000 feet on the United States ranges tributary to Lake Superior, up to 1911.

On Steep Rock Lake, the most westerly extension of the main iron belt, quantities of high-grade hematite-float, led to the discovery of a body of some 70 feet in width, of soft ore, by drilling. It is almost assured that the main body of the Lake is underlaid by this same body of ore.

On the Atikokan range, west of Sabawe Lake, some 15,000,000 tons of magnetite has been proved by drilling operations averaging 55 per cent iron, 13 per cent sulphur, .03 per cent phos. These are high sulphur ores, which, when roasted, make a most desirable product.

East of Sabawe Lake, the Atikokan Mine, the only developed mine in the district, shows some 10,000,000 tons, averaging 55 per cent iron, 2 per cent sulphur, and .10 per cent phos. The output up to date is 86,433 tons averaging 59.85 per cent iron, 2 per cent sulphur and .11 per cent phos.

In the neighborhood of Kaministiqua station, and in the township of Conmee, a large tonnage of lean ore is exposed averaging 35 percent or better. Tests made by the Dominion Testing Laboratories, Ottawa. show that by coarse crushing and jigging, a product running 50 per cent in iron can be obtained with a 2 to 1 concentration.

On the east shore of Lake Nepigon, on the Leitch and Ralph properties, there are numerous bodies of ore running around 45 per cent iron, drilling operations are now being carried on on the Leitch lands with highly satisfactory results.

Further east, on the same range, at Little Long Lake, over an extensive area of iron outcrops, one body 30 feet in width averages 42,67 per cent iron, .05 per cent phos, and another 400 feet wide 42.35 per cent iron, still another 20 feet that averages 49.78 per cent.

The Loon Lake iron field is of a different geological age and character. It is situated 23 miles east of Port Arthur, and is an undoubted eastern extension of the Mesaba range in Minnesota. The beds are flat lying, consisting of interbanded layers of high grade hematite, and lean taconite, and having a total thickness of about 20 feet. The ore is easily separated by hand sorting, yielding from 1¾ to 2 tons of merchantable ore, for every 3 tons of material handled.

By diamond drilling and pitting, the following tonnage has been proved.

	Tons.
McConnell—sorted ore 55 per cent iron..	1,650,000
McConnell—sorted ore 50 per cent iron..	2,430,000
Herstrom—natural ore 48.85 per cent iron..	200,000
Marks-Wiley—natural ore.....	1,168,000
	5,448,000

The ore is particularly low in phosphorous, averaging from .008 per cent to .03 per cent, and would consequently be in good demand. Less than one-third of this field has been drilled, conservative estimates place the tonnage of this field at 25,000,000 tons

The District of Algoma has very large ore supplies. In the Michipicoten district, 111,000,000 tons of siderik ores have been proven by diamond drilling and many known large deposits are as yet untouched.

The District of Sudbury is rich in this basic metal. At Moose Mountain, 100,000,000 tons of magnetite ores have been proven by diamond drilling, and estimates of the possible quantity go far beyond this figure.

With these great deposits, which may only become assets by development, it would seem that it should be the first duty of government to offer such assist-

ance in their exploitation, as would make Canada independent of foreign ores, and not almost wholly rependent, as she is to-day.

Of the 2,242,337 tons of ore charged to Canadian blast furnaces in 1918, 2,145,593 tons. The percentage of imported ore has been steadily in the increase for some years. In addition to the ore imported, Canada imported $153,000,000, worth of iron and steel products, and 67,396 tons of pig iron, in 1918.

These are startling figures, and should awaken some action on the part of the government.

With the exception of the Michipicoten district, every one of the above ranges is traversed by the Canadian National Railway, a further, and most important reason why the whole people should take an active interest in the development of our iron ore, as it would furnish much needed traffic for the railway. In the United States the mining industry contributes 60 per cent of rail traffic. In Canada less than 40 per cent originates thus.

"LAMINATED COAL"

At the statutory meeting of Laminated Coal, Limited, recently held in London, England, the following statements were made by the chairman, Mr. H. F. Smalman-Smith:

"It is scarcely three months since this company was entitled to commence business, and it must therefore be conceded that there has not been time for phenomenal development. The company was formed to acquire certain patent rights, licenses, and other assets in connection with a process known as the "laminating" of small coal. This process must not be in any way confounded with "briquetting." It consists, in part, in "stratifying," or placing the treated material in layers one above another, which by this means, coupled with that of synthetic action during combustion, becomes physically and scientifically reconstructed into a new lump of coal.

In addition to the treatment of small waste coal, this company has extended its operations to the treatment of peat, lignite, oil shale and other substances of a like nature. The result is that nearly all waste products from these materials, as well as the materials themselves, are capable of being converted into fuel of high calorific value, suitable for household and industrial purposes. The cost of manufacture will allow of its distribution at a price considerably below that of ordinary large coal."

The chairman stated that licenses had already been issued to important plants in Britain to erect plants, and that shortly a demonstration plant would be completed at which colliery owners could see their own materials reconstructed by the new process. The process, the speaker anticipated, would become one of world-wide industrial importance.

We would comment that there appears to be for once something new under the sun, and it will be, to say the least, interesting if this new process can improve on the age-long processes of nature, which, we believe, were effected by earth movements and temperatures of a power and range that finite man can only faintly comprehend.

More exact particulars of the announced process are awaited.

OBITUARY.

Stephen Pearson Brown, formerly chief engineer of the Mount Royal Tunnel and Terminal Co., Ltd., Montreal, was drowned last Sunday in Sebec Lake, Maine. Mr. Brown was pulling his nine-year-old son on a sled when the ice broke under him and he sank before the boy could summon help. Mr. Brown was about forty years of age. He was a graduate of the Massachusetts Institute of Technology, and before going to Montreal had been associated with the contruction of the Pennsylvania Tunnel in New York City. He went to Montreal in 1912 in charge of the Mount-Royal Tunnel project and superintended the design and construction until the work slackened in 1916, when he returned to the United States, as vice-president and manager of Ford, Bacon & Davies, a well-known firm of engineering contractors of New York City. Mr. Brown continued to act in a consulting capacity in regard to the Montreal terminal work for the C. N. R., and was expected in that city this month on business in connection with the C. N .R. enterprise. From 1915 to 1917 he was a member of the council of the Canadian Society of Civil Engineers. Mr. Brown was also a member of the Institution of Civil Engineers of Great Britain, the American Society of Civil Engineers and numerous other engineering, railway and scientific societies.—From "Canadian Engineer."

Members of the Canadian Mining Institute will remember Mr. Brown's courtesy at a meeting of the Insitute in Montreal, when a party of members were taken to inspect the partly completed Mount Royal Tunnel, and when later Mr. Brown gave an illustrated description of the engineering problems connected with the driving of this tunnel.

Mr. Brown's death, under such tragic circumstances, and at an early age, will be deeply regretted.

THE LATE ANGUS McDONALD,
Locator of the Gold Pan Mine, N. Man. (Mr. McDonald was killed accidentally a few hours after this photograph was taken).

Our Northern Ontario Letter

THE SILVER MINES

With the price of silver varying between $1.30 to $1.35 an ounce, and receiving payment in New York, the silver producing mines of Cobalt are now netting upwards of $1.40 an ounce for their product. This is due to American money being at such a high premium in Canada. With costs averaging about 55 cents for each ounce produced, the net profit is running high.

During the month of November the Nipissing mine produced an average of $11,674 every twenty-four hours. The month's production totalled $350,209. This compares with a total of $375,247 during the preceding month, at which time the daily average amounted to $12,105. With a surplus amounting to some $4,300,000, and with ore reserves some two years or more ahead of current production, the Nipissing appears to be in a position to reap enormous benefit from the current high quotations for silver.

In an interview with Frank L. Culver, president of the Beaver Consolidated, your correspondent learned that the Beaver is now realizing a net profit of from $2,000 to $3,000 daily. Mr. Culver stated that some of the ore being encountered at a depth of 700 feet is as rich as any previously taken out of the mine. The writer was shown pieces of almost pure silver, quite flat and almost as large as a man's hand. Perhaps the most significant statement made by Mr. Culver was that it is his intention to begin at the surface and work the Beaver Mine all over again. Recent developments, he said, have tended to show that a large tonnage of ore running from 150 to 200 ounces of silver to the ton has been missed during the course of earlier operations.

The Mining Corporation of Canada is stated to have completed the erection of camp buildings on its recently acquired property in the township of Butt, where it proposes to explore for radium.

A deal is being negotiated this week for the tailings pile located on the Chambers-Ferland Mine. This deal was mentioned a week or so ago in these columns as pending. It is now understood to be practically closed, the purchase being something like $55,000. These tailings were deposited on the Chambers-Ferland by other mines, and constitutes a Christmas box, so to speak, for the latter company.

Diamond drilling operations have commenced on the Adanac property, D. D. Chisholm of Timmins having taken the contract for driving the first hole from a cross-cut at the 310-ft. level. It is recognized that the hole is being driven more or less against what is generally looked upon as sound geological advice.

The consolidation of the Hargraves and the Reliance properties has been completed. The new company, known as the Hargraves Consolidated, has a capitalization of 2,500,000 shares. Of this, 1,000,000 is going to the former Hargraves stockholders, 800,000 shares going to Reliance owners, and leaving 700,000 shares in the treasury. The latter will be used to finance the operation and work is now being planned. The Lumsden Mine, recently acquired by C. L. Campbell of Montreal, has been de-watered to a depth of 30 feet and Major Rattray is now making an examination, preparatory to outlining a development program.

At a depth of 150 feet on the Crown Reserve an ore shoot has been opened up which compares favorably with the rich veins formerly worked in that mine. According to official advice, upwards of 10,000 ounces of silver was taken out in one round of shots. The pay-streak in the vein has a width of four inches, sometimes widening out to six and seven inches. It is officially stated that the position of the vein offers reason for believing that it may develop into an ore shoot of considerable importance. Should present values continue, a shoot of enormous value would occur in a remarkably small area.

While new discoveries are being made, and interest increasing in a general way in Cobalt, all of which tends to indicate the possibility of increased silver output from the Cobalt mines, the Gowganda silver area is gradually developing into a field of considerable merit. At the leading operations, the scope of work is being enlarged, while among the prospective properties a good deal of activity is apparent, and numerous deals, large and small, are being closed. Among these might be mentioned the Everett property, which adjoins the Castle on the West. This property is being taken over by interests with whom is associated Sir Henry Pellatt. The McAlpine property, in Haultain township, changed hands, the purchaser being John Oliver of Toronto. The Cartwright property at Bloom Lake has also been sold. These and numerous other deals have been made, the details for the greater part being lacking.

Nor is the activity in the silver area confined to Cobalt and Gowganda. It is now becoming apparent in the Maple Mountain district of the Elk Lake mining division, as well as in the township of Corkhill and in various parts of the Elk Lake district proper.

This week a spectacular discovery of silver was made on the Taylor-Kennedy claims situated in the township of Willett, some two miles from the old Lucky Godfrey property. The find has caused a small rush of prospectors to that area.

The belief that quotations for silver will continue high for a number of years, with reasonable prospects of the Elk Lake-Gowganda area being opened up by means of a meter gage railway, is causing interest in that district to increase rapidly.

THE GOLD CAMPS

Gold production in Ontario during the third quarter of 1919 having exceeded any previous quarter in the history of Ontario, ample reason for the utmost optimism is afforded. Nor has the maximum been reached. The indications are that a steady increase will continue for a number of years. This, due to the strong physical condition of the mines as shown by the sum total of the ore reserves blocked out.

The Hollinger Consolidated will disburse another one per cent dividend on December 31st to shareholders of record tomorrow (December 18). This disbursement will amount to $246,000 and makes a total of seven per cent, or $1,720,000 paid during the current calendar year. In addition to this a surplus of almost equal amount has been called forward to surplus. The Hollinger has now produced a total of something like $43,000,000 in its short career, beginning with 1911. Ore blocked out is understood to about equal the total produced during the past eight years. The management is now endeavoring to add another 900 men to the force engaged. Just as soon as this number can be added, the output may be increased close to fifty per cent over the present production.

The Dome Mines continues to treat about 1,000 tons a day and could bring the operation up to full capacity of close to 1,500 tons daily provided another 150 men could be procured. The prospects of getting this additional number of men is growing brighter. On January 15th the Dome Company will disburse a dividend of 25 cents a share, which is looked upon as the beginning of regular disbursements. It is believed that by the end of the company's fiscal year (March 31st) the rate of earnings will approximate $2.50 a ton and that the mill will be treating an average of about 40,000 tons a month. This would show a net profit of $100,000—equal to 30 per cent on the issued capital of $4,000,000 and show a 10 per cent return on shares at $30 each—the par value being $10 a share.

The Porcupine-Crown Company is negotiating with the Moneta Company with the object in view of taking over control of that company's property, situated adjacent to the Hollinger Mine, on the west. Provided success attends the present negotiations, the Porcupine-Crown would then proceed with plans to resume production.

The electrically driven mining plant on the Clifton-Porcupine has been installed, and is now in operation. Development work is now proceeding at an increased rate. In a circular recently issued, the management declares that a substantial tonnage of ore of a commercial grade has been put in sight.

The Porcupine-Keora is still calling for tenders for the sinking of a 250-ft. shaft, it being planned to have the work under way early in the new year. Heretofore, the exploration of the property has consisted of diamond drilling operations, during the course of which considerable ore is stated to have been located.

The mill on the Dome Lake Mine is expected to be ready to resume operations about the last week in December. Carl Frank, formerly on the staff of the Dome Mines, is in charge of the Dome Lake.

A Canadian-American syndicate has taken an option on the property of the Ontario-Porcupine Development Company (formerly a part of the holdings of the Buick-Moreing interests). It is planned to carry out exploration work on that part of the holdings situated at the east end of Pearl Lake, and adjacent to the Plenaurum.

Diamond drilling has commenced on the North Woods property, situated adjacent to the old Foley O'Brien, just outside of the town limits of South Porcupine.

In the Kirkland Lake district, additional operations are being commenced. The Lake Shore during November treated ore from a surface dump, and production amounted only to $10,246.28. The underground workings, however, have now been de-watered to a depth of 300 feet and current production is from ore drawn from underground. By the beginning of the new year production should be back to almost normal.

The mill of the Kirkland Lake Gold Mines is treating ore at full capacity of 150 tons a day. A record of 173 tons was established for one day. All underground work contiue to be favorable. The large ore body as developed at the 600-ft. level has been found to continue to the 700-ft. level, where considerable free gold is present.

The Canadian Kirkland is now equipped with a mining plant and mining operations are being carried forward. The property is under the control of the Crown Reserve Mining Company, and is looked upon as a prospect of more than ordinary merit.

The Ontario-Kirkland is also proceeding with development work, preparatory to blocking out ore in sufficient quantity to warrant proceeding with the installation of a mill in the spring. Directors who recently visited the property have recommended the purchase of machinery and supplies so as to take advantage of the snow roads in the work of hauling the heavy parts to the property.

In the Fort Matachewan district, the leading operation, the Matachewan Gold Mines, has suspended underground work for the time being. It is understood that diamond drilling will be continued.

On the Maloof property at Sesekinika, arrangements are being made to commence exploration by diamond drilling. The work will probably begin about the end of this week. It will be recalled that some years ago a considerable amount of gold tellurides was opened up on surface in this district. The veins were comparatively narrow.

At the Miller Independence Mine, at Boston Creek, the shaft has now passed the 400-ft. level and should reach the 500- ft. level by the middle of January. A working station will be cut at that level and a crosscut driven for the purpose of cutting the downward continuation of the rich ore body developed near the surface in an incline shaft. In the meantime the power line is being completed, and by the end of January electric energy should be available. This will be followed by the addition of two more machines and progress will be much more rapid. The outlook for Boston Creek is encouraging.

A CORRECTION.

In connection with an item which appeared in the "Journal" of the 3rd December, in which Mr. H. E. Bodine was quoted concerning the "Blue Lead" in Alaska, we are informed by the Director of the U. S Geological Survey that Mr. Bodine has at no time been employed by the Survey, and that no such accident took place as was reported by Mr. Bodine to have occurred to Mr. S. R. Capps.

A Comparison of Gold and Silver Production in Ontario

Gold Output Likely to Exceed Value of Silver Output by 1920

(By J. A. McRAE)

The official report of the Ontario Bureau of Mines, covering the nine months ended September 30th, corroborates in every way the figures presented from time to time during the period in these columns. The report declares that at the present rate the 1919 output will reach at least $10,000,000.

In addition to this, it is a fact that the rate of production, since the above report was compiled, has increased considerably and the current rate of output may be conservatively estimated at $1,000,000 a month. To gage the importance of this, it is of value to turn to the amount produced in the United States, where during the whole of 1918, the output amounted to $68,646,700. This seems to indicate that Ontario's gold production is now at a rate of about 15 per cent of the total of the United States. Further, that the gold mining industry in this province is new, and is recording rapid growth. In discussing the situation with gold mine operators, the hope is expressed that the 1920 production may exceed $14,000,000. Compared with this the best previous record was established in 1916 when a total of $10,339,259 was reached.

During the past thirty-three years, the gold output of Ontario amounted to only approximately $61,000,000. In order to grasp the ipmortance of the industry as at present, it is interesting to note that of the above total some $36,542,833 was produced during the five years just ending. It is a fact that the gold output of the province first passed the million-dollar mark in 1912, and it was not until after that time that the industry became one of first-class importance.

Followig is a summary of production during the past thirty-three years, the 1919 figures being based on available reliable figures:

Year	Fine Ounces	Value
1887	327	$6,760
1888	....	....
1889	....	....
1890	....	....
1891	97	2,000
1892	344	7,118
1893	708	14,637
1894	1,917	39,624
1895	3,015	62,320
1896	5,563	115,000
1897	9,157	189,294
1898	12,862	265,889
1899	20,394	421,591
1900	14,391	297,495
1901	11,844	244,837
1902	11,118	229,828
1903	9,096	188,036
1904	1,935	40,000
1905	4,402	91,000
1906	3,202	66,193
1907	3,212	66,399
1908	3,212	66,389
1909	1,569	32,425
1910	3,089	63,849
1911	2,062	42,625
1912	86,625	1,788,596
1913	219,801	4,543,690
1914	268,264	5,545,509
1915	406,577	8,404,693
1916	497,836	10 339,259
1917	420,894	8,698,881
1918	450,000	9,100,000
1919 (est.)	500,000	10,500,000
Totals	2,973,411	$61,373,887

In the gold mining areas, chief among which is Porcupine and Kirkland Lake, there is manifest a degree of enthusiasm not shared by many other gold mining areas in the world. The reason for this is that the average grade of the ore is high, and even at present high costs leaves a margin of around fifty per cent net profit. Accordingly as the forces engaged increase, the cost of operation is becoming more favorable. The Hollinger is endeavoring to add at least 900 more men to its force, the Dome another 150 men, with a corresponding demand for additional men at the other producing mines.

Two other facts, more or less of uncertain quantity, but, nevertheless, having a favorable influence, are the high rate of exchange between Canada and the United States, together with the strong agitation in America for a bonus on new gold. Large financcial interests in the Estates are now known to be accumulating a large amount of shares in the leading gold mines of Northern Ontario. In doing this they get the benefit of the rate of exchange, which, at the time of writing has reached about eleven per cent. On such shares as the Dome Mines, a saving of about $1.50 a share is made at the outset. As to the agitation for a bonus on new gold, it is exceedingly significant to note that the American Bankers' Association as well as the American Mining Congress are urging the United States Government to pay $10 an ounce for newly produced gold. That these factors will attract added attention to the gold mining companies of this country appears to be certain.

The gold mines are all well stocked with coal. Cyanide is procurable at a reasonable price and the cost of labor is quite reasonable. Taking all factors into consideration, the opinion of leading mining men has taken a decidedly optimistic turn to the end that durinf 1920 the gold output of this province may exceed the value of the silver output of Ontario.

PORT ARTHUR NOTES

(By J. J. O'CONNOR)

A serious accident occurred on the 8th instant, at the Northern Pyrites Mine, at Northpines, Ontario, which caused the death of two men, and some damage to the plan caused by the explosion of the compressed air container.

Mr. W. A. Bartlett, Inspector of Mines for the Province of Ontario, is in the city today, on his way to Dryden, Ontario, to make a complete inspection of the mine and workings of the Wachman Mining Company's operations at Contact Bay, Vermillion Lake. On his return he will make an inspection of the Federal Mining Company's silver property, in Paipoonge township, about three miles from the Rabbit Mountain Mine.

Mr. Bartlett is the discoverer of the Bartlett and Magpie iron mines, in the Michipicoten district.

Nova Scotia Notes

Cape Breton Coal Mines.

Production of coal has improved, as is the rule in the weeks immediately preceding the Christmas holidays. On one day in the week ending the 13th December, the Cape Breton collieries of the Dominion Coal Company produced the largest day's output since April 1918, namely 12,558 tons. This figure represents about two-thirds of a fair day's production for the same mines before enlistments withdrew the producers from the mines.

Apart from weather delays, it may be expected that the Dominion Coal Company's mines in Cape Breton will work steadily throughout the Winter months. Something like the normal shipping fleet of the Company should be available for water transportation next Summer, and it may be anticipated that the policy of the Company will be to stock coal during the Winter, in the intervals of loading shipping, so as to be prepared to send coal to Montreal next Summer, and regain some part of the previous Montreal custom.

A number of Conciliation Boards have been appointed to adjust the wages question outstanding between the various U. M. W. locals and the several coal companies. There seems no reason to anticipate any difficulties in the way of settlement, and if satisfactory arrangements can be cone to between the parties, it may be possible to make a wage agreement over a term of one year. It is also possible that in the case of the Glace Bay collieries that an agreement may be come to between the Dominion Coal Company and its workmen without the actual formal intervention of the Board of Conciliation.

Pictou

The official announcement of the acquirement of control of the Acadia Coal Company by the Nova Scotia Steel and Coal Company is the most interesting piece of news that has recently been given out in this district.

The Pictou coalfield is a difficult one to understand, but it is a field of much promise. During the administration of the Belgian interests, which the Scotia people have now taken over, the property of the Acadia coalfield was more thoroughly and more scientifically prospected than it had ever been previously, and Mr. Notebaert, the Mining Engineer of the Acadia Company, has proved himself to be a mining engineer of exceptional skill. It is not too much to say that the property of the Acadia Coal Company, as it has been taken over by the Scotia Company, was never in its history in better condition, more developed, or as thoroughly understood in its structural relations to the main coalfield. The capital which the Belgians invested in the Acadia properties has been invested to the permanent benefit of the Pictou coalfield, and the Belgian management did unusually good work in a coalfield of extraordinary complexity. The number of coal seams already proved in the Stellarton area controlled by the Acadia Coal Company is sixteen, but there is very reasonable possibility that others may be encountered at lower depths. Another undeveloped asset of this field is the oil-shales and oil-coals which are associated with the coal seams in much profusion. The Stellar, or Oil Coal seam (from which the town of Stellarton is named) is a case in point.

Commenting in this connection, Mr. F. W. Gray's Bulletin (Mines Department Bulletin No. 14 states:

"The coal companies are more interested in the "distillation of oil shales than is perhaps realized, be- "cause not only do the oil shales occur within the "mining areas of coal companies now operating in "Nova Scotia, but these companies have also access "to large quantities of inferior coals, coaly shales and screenings, which, at some future date may, very con- "ceivably, be found to yield a sufficient percentage "of hydro-carbons to justify the extraction of these."

It should not be forgotten that the Scotia Company itself was formerly an operator in the Pictou field, and that it still holds leases which can be advantageously linked up to the Acadia holdings.

New Brunswick.

The publicity that has been given to the Minto strike is extraordinary, considering its relative importance. Every Canadian newspaper from East to west has had head-lines about the strike at Minto, N.B., and very few of those who read the dispatches knew that the strike involved not more than one hundred men all told. So far as it is possible to gather from the newspapers, the award of the Conciliation Board does not seem to have been marked by any striking ability, and it would seem that both locally and abroad too much importance has been attached to a trouble that presented no very grave issues, and from which neither side and anything to gain by such disproportionate publicity as has been given to this storm in a teacup. The coal-mining industry at Minto is small, and can never be very much bigger because of the limited character of the coal deposit, but it is of much local importance because the single thin seam worked in New Brunswick is an isolated patch of coal some hundreds of miles distant from the nearest coalfield. The Minto people should have enough sense to compose their own differences, and take advantage of the purely local market that is all their own. Moreover, the Minto miners have mostly been brought in from the outside, with some considerable difficulty and expenditure of money, and they will not easily be replaced if they scatter. Mutual interest should have dictated a more conciliatory policy on the part of all the parties concerned, because, to the rest of Canada, despite the tremendous publicity given to this strike, whether the Minto mines work or not is a matter of relative non-importance.

THE CONVOY PORTS OF HALIFAX AND SYDNEY

"World's Work" for December contains the first of a series of articles by Rear Admiral Sims, U. S. Navy, in which are contained some interesting references to the use of Sydney and Halifax, Nova Scotia, as ports of assembly and departure for merchant-ship convoys.

To those whose good fortune it was to witness the periodical gathering of the fleets of dazzle-painted ships in Sydney Harbor and Bedford Basin, Admiral Sims' recital will call up interesting memories, and it is worthy of note that during nearly five years of war the shipping of coal and steel proceeded virtually without interruption.

As Admiral Sims states, once the convoy system was properly organized, the arrival and departure of the convoying warships proceeded with the regularity of a train service.

Special Correspondence

BRITISH COLUMBIA

Vancouver, B. C.

A company, with a capitalization of $10,000,000 is proposed for the purpose of undertaking in British Columbia the establishment of the plant necessary to smelt and refine all the ores produced in the Province. The enterprise would involve the erection of smelters for treating copper, silver-lead and zinc ores, producing the refined metals ready for the market, and supplying alloys of the same. It also would include the launching of a commercial iron and steel plant. It is understood that the project is to come before the Vancouver Board of Trade and that, in all probability, the government will be asked to provide some form of encouragement and support.

The Talpoppin Mining Company, organized in Vancouver and of which A. Wallace, a well known businessman in president, is said to have property of much promise on Burns Lake in the Omineca District. Report, which must be considered authoritative, are to the effect that there are several well defined veins carrying high silver values. The claims, however, are little known as yet to any outside those immediately interested. The latter propose carrying on development without delay and have proceeded with the construction of a road to facilitate transportation.

That he has negotiated the transfer of 16,000 acres of oil lands on the Athabaska River, northern Alberta, acquired from the Dominion Government last year, to a financially strong Eastern American Syndicate, is the statement made by Charles F. Law, of Vancouver, on his return recently from Boston and New York. This field is said to have been first explored by Sir John Richardson, of the Franklin Expedition, and a map with geological notes were deposited with Earl Bathurst, who then was Colonial Secretary. A sample of the tar sands exposed on the Athabaska River was taken to Boston and analyzed by Arthur Little & Co., chemists, and found to contain oil to the amount of 25 per cent to its cubic contents. The tar sands average 100 feet in thickness. It is generally believed that drilling back of the Athabaska River, where the covering of the sands is several hundred feet thick, will result in the finding of petroleum of high grade. Geological notes from Sir John Richardson's report, prepared over a century ago, are given as follows:

"About nineteen miles below Fort McMurray and a mile from the right bank of the river, a saline spring occurs. This spring rises from the summit of a rounded hill which is about fifty-six yards in diameter, sixty feet high, and entirely encrusted with salt deposits. This hill is bounded on three sides by the high bank of the river, which here recedes a little and forms an even round backed ridge, rising two hundred feet above the spring. A small clayey plain on the southwest side of the hill is traversed by the rivulet from the spring and opens into a bay of the river. The rock exposed is limestone.

"At a considerable distance from Calumet a limestone similar to that last mentioned occurs, having its strata waving or dipping both to the east and west. Below this there is a peaty bog, whose crevises are filled with petroleum.

"This mineral exists in great quantities in this district. We never observed it flowing from the limestone but always above it and generally agglutinating the beds of sandstone into a kind of pitchy sandstone. Sometimes fragments of this sandstone contain so much petroleum as to float downstream. The limestone dips under the water and disappears at Calumet and the pitchy sandstone cliffs also terminate there. This spot, situated about three or four miles below an old fort, obtains its name from a bed of compact marl which form a small cliff on the bank of the river and is quarried by the voyageurs for making calumets or pipes."

Hazelton, B. C.

After visiting the Silver-Standard Mine it is stated by General J. W. Stewart, who is one of the chief owners and who returned from active service in France only a few months ago, that development at greater depth will be undertaken without delay. He says that there is no doubt that he and his associates have a mine and, if expectations are confirmed by the work proposed, it will become one of the largest producers of the Province. The Silver Standard Mine has been opened up and proven to a depth of 250 feet on what was previously known as the main vein and to a depth of 125 feet on No. 4 vein. The ore as a rule is high grade but of a somewhat complex nature, requiring a little different treatment from the usual run of silver lead ores. The proper treatment, however, after considrable research, has been established. General Stewart states that it has been realized that development at greater depth is necessary and plans have been considered with the result that it has been decided to run a new crosscut, which will be about 900 feet long to cut the No. 4 vein at a depth of 200 feet. The No. 4 is the new vein which has proven a valuable ore producer. There is considered to be no reason why that ore shoot should not extend to the lower level and if it does the Silver Standard will be definitely established. When the tunnel reaches No. 4 vein a drift will be run in both directions and the tunnel then will be continued on the original main vein, cutting the latter at a depth of 250 feet. Thus the ultimate length of the tunnel will be 1500 feet. The new tunnel also will cut No. 1 vein at a depth of 100 feet. although a drift to the south probably will be necessary to get under the shoot. Up to the present No. 1 has received nothing more than a little surface development but assay returns from its ore are satisfactory. Nos. 2 and 3 veins also will be cut. The tunnelling will be done by contract. In connection with this work a 400-foot surface tram connecting the upper workings with the tunnel will be installed for the purpose, in the meantime of conveying supplies, and later for the transportation of ore. It is not the intention to make any improvements to the power plan and mill at present but when the plans outlined are complete the entire equipment will be remodeled.

Prince Rupert, B. C.

Twelve mining claims have been staked on a gold-bearing ledge extending from Lisianski Inlet to Stag Bay on Chicago Island by J. H. Cann and associates of Prince Rupert. It is stated that casual samples, taken at intervals of twelve feet along the ledge, give returns averaging $239.95 to the ton.

Kamloops, B. C.

Interests held by Messrs W. H. and G. J. Hammond in the magnesium sulphate deposits at Basque B. C., have been disposed of to eastern capitalists, $125,000

being the sum mentioned as having changed hands in the transaction. Referring to this property, which has been held and to some extent operated by the Basque Chemical Production Co., Limited, the Minister of Mines Report for 1918 quotes Charles A. Newhall, of Seattle, Wn., in part as follows:

"The examination was made on the lakes on March 8th. Considerable snow was on the ground and it was impossible to form an exact estimate as to the extent of the salts, in that we could not distinguish between the mud and the salts. In general the formation of these lakes is similar to the ones that are being worked in the district tributary to Oroville, Wn. The salts occur in pools of varying shapes and sizes; these pools being surrounded by mud-rings. The excavations made on the lakes indicate that the pools carry layers of salt to a total depth of approximately 20 feet, the salts lying in layers and intermixed with mud. These pools are more or less conical in shape, tapering off towards the bottom. In other words the greatest area is exposed at the surface. Mud to varying depths lies between the pools, and this mud in other lakes has always been found to carry more or less salts."

A number of samples were taken by Mr. Newhall, the result of the assay of one being as follows:

	Sample No. 1 Per cent.
Insoluble matter	0.76
$MgSO_4$	44.58
Water	50.84
Other soluble solids	3.82
	99.24
Epsom equivalent to $MgSO_4$	91.24

Several carloads of the product already have been shipped to Eastern Markets, where the demand, evidently, is gratifying. The force employed recently was increased and, with the change in management, it is stated that the facilities for increasing the output materially are to be provided.

The deposits are situated in the Dominion Government Railway Belt, only a short distance from the main lines of the Canadian Pacific Railway and near the Cariboo Road between Spence's Bridge and Ashcroft. The property includes five lakes.

Nelson, B. C.

The Utica Mine of the Ainsworth Division has not been operated for some time but T. J. Poyntz, formerly superintendent, has not lost faith in the property. Working a portion of the old workings he recently made a strike of high grade silver-lead ore and now is socking a quantity of the best for shipment. It is not unlikely that some action will be taken to develop this mine further as it is the opinion, in well informed quarters, that it has not been exploited to the limit of its possibilities. The Minister of Mines Report of 1918 shows that the Utica was operated for three months in that year, that 222 tons of ore were shipped, and that tonnage yielded 13,661 oz. silver and 10 tons lead.

Hon, John Hart, provincial minister of finance, was requested, while in Nelson recently, to submit legislation to the Provincial Legislative Assembly at its next Session, providing for the amendment of the Taxation Act in such fashion as to grant a more liberal form of relief to operators of gold mines. Under the Taxation Act of 1918 a gold mine is deemed to be a mine whose gold recoveries amount to 85 per cent or more of the total value of the metal content of the ore. Mines coming within this classification are exempted from the 2 per cent tax on output in recognition of the unfavourable condition of gold in the market. Representations were made to Mr. Hart than it was at the time of the enactment of this legislathat the position of gold now is more unfavourable tion and that the advance in silver made it difficult for any gold property having even a very small proportion of silver in its ore values to come within the 85 per cent definition. It was stated as an example that $17 gold ore, containing even 2½ ounces of silver at the present price, fell outside the exempted category, yet the property was essentially a gold property. It was held, as a matter of fact, that very few purely gold properties can operate under present conditions. Mr. Hart was requested to revise the definition of a gold property downward, in order that the class of poperties it was intended originally to benefit might come within the classification.

Trail, B. C.

Fire destroyed the copper mill of the Trail Smelter, Consolidated Mining and Smelting Co., Ltd. of Canada, recently and the company, losing no time, now has the necessary repairs in hand. It is announced that the misfortune does not necessitate the suspension of copper ore shipments to Trail for treatment. The lead mill is being re-arranged and, pending the completion of the new copper mill, copper ore will be crushed at the lead mill. The latter, of course, also will take care of lead ore.

Ore receipts in gross tons for the week from November 15 to 21 inclusive at the Consolidated Mining and Smelting Co.'s Smelter, Trail B. C. totalled 4,648, the aggregate tonnage for the year to date being 289,816. Of the independent shippers the chief contributors were: Florence, Princess Ck., 153 tons; Josie, Rossland, 318; Mandy, Le Pas, Manitoba, 156; Paradise, Athalmar, 41; Rambler-Cariboo, Rambler, 52; Standard, Silverton, 199; Van Roi, Silverton, 41; and Whitewater, Ratallack, 40. The Centre Star Mine, Rossland, was the principal shippers of the company properties with 1876 tons while the Sullivan Mine, for the first time for weeks, shows a shipment of 259 tons of zinc ore. This, however, does not mean that the strike is at end.

Stewart, B. C.

That the first shipment of ore from the Premier Mine still is at Hyder, Alaska, awaiting shipment is the statement of P. Daly, who took it out under the terms of a lease he had from O. B. Bush in 1915. He was working the property then on a royalty basis. The ore was sledded to tidewater. Mr. Daly says that there are about eight tons which assays around $200 a ton. He will send it to the smelter as soon as transportation is obtained.

There is no doubt of the sentiment of mining men who have visited the various camps in the Salmon River section as to their future. Without exception they are enthusiastic. Dr. M. W. Bruner, who has just returned, deserибes it as the most wonderful mineral belt he has ever seen and looks forward to seeing a railroad constructed up the Salmon River. Charles F.

Caldwell, the well-known British Columbia operator anticipates much development in the Spring and states that the mine owners propose tackling and solving the transportation problem.

Alice Arm, B. C.

Major A. W. Davis, the mining engineer who has had charge of the operations of the Dolly Varden Mine, has left the employ of the Taylor Mining Company and has gone into private professional practice in Vancouver, B. C.

The Dolly Varden Railroad has been closed down for the Winter, the locomotives and rolling stock being placed in roundhouses where they will be overhauled preparatory to the new year's work.

Operations at the Mine will be continued through the Winter so that when the railroad is opened there will be a large quantity of ore on the dump for shipment.

Communications will be kept open for the distance of 17 miles between tidewater and the Mine by means of dog teams.

Nelson, B. C.

While the output of the East and West Kootenays may not be as great this year as last it is the opinion of Fred. A. Starkey, secretary of the associated Boards of Trade of Eastern British Columbia, that the mining industry has never been more active or given such promise of sound development.

Referring to the Sandon District he points out that the ore body recently discovered on the Silversmith Property carries high values and is said to be most important. The development of the Noble Five and the Reco, and the erection by the operating Company of a 1500-ton Mill, are mentioned as incidents of a gratifying nature. He speaks, also, of Clarence Cunningham's new mill, which is running at full capacity treating the ore of the Queen Bess, Sovereign, Wonderful and the Alama-Idaho Mines. The Canadian, Adams, and Ivanhoe Groups as well as the Surprise and Bosun are being vigourously developed by the Roseberry Surprise Mining Co.

Mr. Starkey mentions as being under development and as having, in some cases made shipments, the McAllister, Ocean, Van Roi, Silverton, Enterprise, Neepawa, Molly Hughes, Black Prince, Ottawa and Evening Star, The Standard, it is explained, is being further opened up and has been shipping zinc concentrates.

In the Kaslo District the Cork Province has been reorganized in order to raise finances for further development of large ore bodies at depth; also to acquire more water power which is needed for the milling plant. The Silver Bell, Index, Gibson, Flint and other properties are also under development. All these are new prospects opened within the last eighteen months. The Old Blue Bell, the oldest mine in the Country, the Ainsworth, Florence No. 1 and several others have been shipping.

The same rate of progress is being made in the Lardo District, where the White Water, Comstock, Bannockburn, Bullock, Silver Cup, Tenderfoot and others are expected to be among next year's shippers. Sheep Creek is well ahead with development and the Queen and Nugget are getting close to the point at which it is expected to encounter the main vein at depth. The cross-cut which was made in the former mine and which went through schist is only now 400 or 500 feet from the quartz.

The East Kootenay has shown marked improvement, the North Star, Paradise, Victor and several others having made shipments.

Slocan, B. C.

The Silver Glance Property, Bear Lake, has been bonded and will be developed quite extensively by the new owners. The vein is in granite and is a true fissure about 25 feet in width, coursing north and south, dipping about 60 degrees to the East Two heavy guage seams are on foot and hanging walls, the territory between being crushed granite cemented with quartz, which carries the values. Compressed air will be used in development and it is planned erecting a mill to treat the ore by flotation.

Owners of the Index Mine have acquired the Flint Claim, on which some development has been done with satisfactory results, the consideration being about $22,500. The Government Mining Engineer in 1817 reported that "a nice showing of one foot of solid ore averaging 100 oz. silver and 65 per cent lead" had been opened up. Since then some work has been done. It is understood that operations are to be carried on through the Winter.

Vancouver, B. C.

Maurice D. W. Bacon, of Los Angeles, Cal., has filed suit in Spokane, Wn., against B. K. Neill, of Spokane, for a half interest in the Premier, formerly the Bush Mine situated near Stewart, B. C. It is asserted by Mr. Bacon that a partnership existed between him and Mr. Neill; that the value of the Bush Mine, as it then was termed, was misrepresented to him and that Mr. Neill thus obtained possession. Mr. Neill states that there is n ofoundation for the claim made.

Since the report of a large deposit of limonite ore being found on Whitewater Creek, Lillooet District, there have been inquiries and press announcements which, while not of a definite character, indicate that interest has been roused in the possibility of establishing an iron and steel industry.

Requests for information as to the extent of the deposit referred to, and as to the magnetites of the Coast, have come from various sources. English capitalists, mining men interested in the Orient who state that, owing to unfavorable conditions there, they might be induced to move to British Columbia if reasonable encouragement were given, and Provincial financiers have been sending out feelers and compiling data as to the prospects. In short it would appear now that, should the investigations that are to be initiated in the Spring in connection with the Whitewater Creek ores, prove satisfactory the commercial development of this deposit will follow.

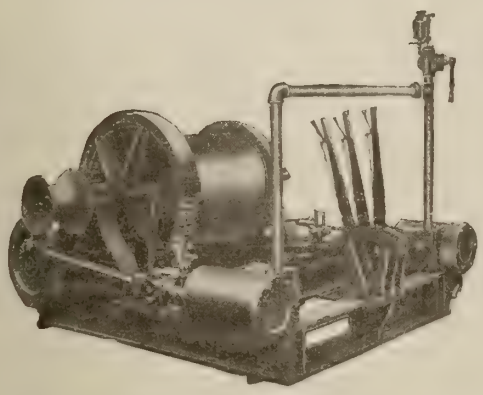
As an instance Percy Scott Leggatt, director of Thomas Summerson & Sons, railway owners and car builders of Darlington, England, is quoted as stating that his firm is considering launching an iron and steel industry here. His firm is interested in smelters and refineries in England.

Mr. Leggatt evidently is satisfied that the ore necessary is available. He seems to be impressed with the possibilities of the electric furnace but says a first necessity is cheap power supply.

Experts have been conducting experiments with iron ore samples from different parts of the world on behalf of Summerson & Sons and the specimens from British Columbia, and especially those from Texada Island, are said to be suitable.

MINE HOISTS

STEAM, ELECTRIC or BELT DRIVE



This shows one of the smaller sizes of our Steam Power Mine Hoists.

Photos of other types sent on application.

Let our Engineering Staff assist you in the selection and design of your Hoist.

IF YOU WANT A SMALL HOIST for prospecting or experimental work, one that can be moved about easily from one prospect to another, we recommend our Ten Horse Power size. If you want to use steam power, we can supply the boiler on a separate base, making two portions easily handled. If you prefer gasoline power, our 10 H.P. Belt Driven Machine, bolted on skids with the gasoline engine, makes an ideal outfit, light, compact, powerful and dependable.

IF YOU WANT A LARGE HOIST for a permanent installation, we can supply you with any size you need up to Fifty Horse Power. We build these machines to suit the buyer, right to the smallest detail, and make them strong, safe dependable. Our shops are very busy just now turning out these Mine Hoists, both steam and electric types, right up to the largest size, but we are still able to give reasonably prompt delivery.

Marsh Engineering Works, Limited, *ESTABLISHED 1846* **Belleville, Ontario**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Victoria, B. C.

The oil possibilities of territory within the Peace River District, and adjoining Dominon Lands in the same area, are declared to warrant further investigation by Hon. T. D. Pattullo, Minister of Lands, in the British Columbia Government. Mr. Pattullo's statement is based on the report of Professor J. C. Gwillim, who conducted a party into the Country in question last Summer on behalf of the Government, an appropriation of $50,000 having been made to permit of inquiry being made into the resources of the Peace River Section in respect of coal, petroleum, and natural gas. It is likely that a larger sum will be asked for at the forthcoming session of the legislature to permit the work to be continued.

The Standard, the Shell and the Anglo-Canadian oil companies are showing strong interest in the oilfields of the Great Slave Lake and Peace River District of the Canadian Northwest. Representatives of the Anglo-Canadian Company who are in Ottawa believe that there will be important developments in reference to oil production in the next few years.

A large movement of prospectors, well equipped for their work, is predicted into the northwest with the opening of navigation on the northern waterways. Anticipating this mounted police posts are being established.

The Standard Oil Company and the Angla-Canadian Company are understood to have secured leases covering considerable tracts of oil lands in the vicinity of Great Slave Lake. The former will send two outfits and the latter one to the ground to make tests.

The Shell Oil Company is understood to have several survey parties at work in possible oil fields situated in the Province of Alberta.

Princeton, B. C.

The property of the Princeton Mining and Development Company, situated on the Similkameen River about four miles from Princeton, is to be re-opened. A bunkhouse is under construction and early in the Spring a compressor is to be installed, after which drilling will start. Work done so far has given satisfactory results, a carload of copper ore shipped last summer having encouraged the owners.

Trail, B. C.

Ore receipts in gross tons for the week from November 21 to November 28 inclusive at the Trail Smelter of the Consolidated Mining and Smelting Co. totalled 7,708 tons. The chief independent shippers were the Alamo, Alamo, 107 tons; the Josie, Rossland, B. C., 721 tons; the Mandy, Le Pas, Man., 156 tons; the north Star, Kimberley, 316 tons; the Standard, Silverton, 403 tons. Of the company's properties the main contributories were the Centre Star, Rossland 2907 tons; the Emma, Eholt, 479 tons; the St. Eugene, Moyie, 1507 tons; the Sullivan, Kimberley, 858 tons.

WANTED—A competent man with experience covering the principal departments of electrolytic copper refining. Must be prepared to go to Europe if necessary. State terms in application, also experience in design construction and operation, giving references. Mark envelope "Application" and address to W. J. Forrester, Imperial Bank Chambers, Leader Lane, Toronto.

NEW PLANT OF CANADIAN NATIONAL CARBON COMPANY AND THE PREST-O-LITE COMPANY UNDER ERECTION IN TORONTO.

The Canadian National Carbon Company, Limited and the Prest-O-Lite Company of Canada, Limited have jointly purchased the westerly ten acres of the property at the south west corner of Bathurst and Davenport Road in the City of Toronto, known as the Hillcrest Driving Park, as a site for a large new manufacturing plant.

The Canadian National Carbon Company are manufacturers of the well-known Columbia and other dry batteries, Cilumbia storage batteries, Eveready "Daylo" flash lights, Carbon brushes for electrical machinery, Electrodes, etc.

The Prest-O-Lite Company of Canada, Limited are manufacturers of the Prest-O-Lite storage battery, Prest-O-Lite welding and cutting apparatus, Pest-O-Lite Dissolved Acetylene, Prest-O-Lite gas tanks, lamps and other automobile lighting and starting accessories and apparatus.

The new plant which is to be erected in Toronto at once is the largest manufacturing establishment erected in Toronto for several years and will consist of two buildings, one of which will be 80 feet wide by 400 feet long, two storeys high with one section 80 x 80 three storeys high, to be occupied by the Canadian National Carbon Company, Limited while the second building for the Prest-O-Lite Company will be 80 feet wide by 400 feet long and two storeys high.

The heating plant will be housed in a separate structure, 50 x 60 and will have room for installation of additional boilers for future units to be added.

All the buildings will be of re-inforced concrete frame, flat slab floors, mushroom type columns on twenty-foot centres, steel sash and brick curtain walls.

Each building will have two freight elevators and all toilet accommodations and stairways will be contained in towers erected on outside of buildings, thereby removing any obstructions which might interfere with manufacturing operations.

Arrangement is provided for special rest rooms for female employees, shower baths, a dispensary with competent medical attendant to look after any injuries to employees; restaurant with modern, equipped kitchen in charge of a competent Chef where meals will be cooked and served to employees at bare cost. In fact, both companies propose to make the new plant by removing any obstructions which might interfere the owners but for its employees

The plant will be served by two switch tracks operated under a joint agreement between the Canadian Pacific and the Canadian National Railways.

It is expected that the plant will be ready for occupancy in May 1920 and everything possible will be done to get it ready my that time.

At the present time the two companies are operating five plants at different locations in Toronto but owing to the large demand for their goods have been unable to fill orders for some time past and propose now to get facilities which will enable them to take steps now to get facilities which will enable them to take proper care of their customers.

Mr. R. H. Combs, who has been General Manager of the Prest-O-Lite Company for the past three years and who was also recently appointed General Manager of the Canadian National Carbon Company, states that his companies expect about five hundred people as soon as the new plant is ready to operate and that the facilities provided by these first two units will take care of upwards of 700 employees if needed. "We have secured enough ground" says Mr. Combs, "to enable us to put up six such units as the two which are now being built but before adding new units, both the present units will have a third storey added, as the buildings are being erected to carry three full floors."

In addition to the large plant described above, Mr. Combs states that the company will erect in the Spring, a new acetylene gas plant in Toronto or immediate vicinity, to take care of the greatly increased demand for compressed Prest-O-Lite gas for welding and cutting and that a large new storage battery warehouse and assembly plant will be erected at Winnipeg.

The contract for the large Toronto plant has been awarded to Messrs Wells & Gray, Limited, of Toronto, a purely local, Canadian Company, who have in the past few years executed some very large contracts for large American and Canadian Companies, such as the Wm. Davies Co.; Canadian Pacific Railway and H. Walker & Son, two of their notable jobs being the large plant of the Ford Motor Co., Ltd., at Ford, Ontario, and the large new plant of The Peters Cartridge Company at Cincinnati, Ohio, where they gave a rare demonstration of Canadian aggressiveness in the construction of a great plant in record time right in the midst of big American contractors who tried hard for the contract.

WANTED.

CHEMIST, American, desires position. Several years experience in blast-furnace work, besides steel, ores, electrolytical processes, food products, etc. Best of references. Box 3, Canadian Mining Journal, Garden City Press, Ste. Anne de Bellevue, P.Q.

INDUSTRIAL HOUSING.

A writer in the Boston "Financial Bureau" draws attention to the tremendous programme of building now in course of development in the United States, and deplores the fact that the percentages of construction of industrial plants is out of all proportion to the provision which is being made for housing the workers. He says that large industrial expansion creates an additional demand for labor which must be brought into the locality. If there are not adequate housing facilities for this imported labour, "the community is immediately in possession of a very sinister social problem—a housing problem. The higher-paid men bid the lower-paid men off their feet, the number of persons per room is increased, and sanitary and moral conditions consequently lowered; everyone is paying more than he can afford for rent, and there is a constant floating population which is unable to get accommodation, because none exists. This inevitably breeds discontent, and fertilizes the ground for the clap-trap radical orator."

One of the most noticeable features of the financial pages of Canadian newspapers in recent months has been the large number of new incorporations, the tremendous projection of United States interests into the Canadian field, and the great number of new factories mooted for Canadian industrial centres. It is equally certain that nothing like the same proportionate activity marks the erection of moderately priced houses, and, as everybody knows, the housing problem in Canadian towns and cities is sufficiently grave already.

The duty of providing houses for workmen should go side by side, and should be accepted by employers of labour as part of the necessary expenditure for industrial extensions. If this duty is not undertaken, the employer suffers in many ways. As the writer previously quoted says:

"A floating labour class inevitably increases the "labour turnover of a factory. Nothing will run up "factory costs quicker than a constantly changing "personnel, no one offers the I. W. W. agitator a more "inviting field than the roving workman, who lives in "a barrack or a boarding-house, and has not a penny-"worth of permanent investment, because it is not "portable."

It is becoming more and more realized that the I. W. W. trouble in the Western States of the Union is the outcome of the formation of a class of "landless men" brought about by the seasonal work periods of the harvest fields, lumbering and other industries that do not offer men a permanent home or steady employment. There is much reason to believe that Bolshevism, with all its hideous consequences, was born in the I. W. W. circles of the United States, and the policy of United States employers of labour, possibly unconsciously, is not blameless in the creation of this class of roving, landless, homeless men, who naturally follow the age-long path of the Ishmaelite.

One shining example of the opposite tendency is the policy pursued in housing by the Granby Consolidated Co. at Cassidy Mines, already described in this journal Such faith and vision cannot fail of its just reward.

Canada is not a country for "landless men". The climate discourage aimless migration, and our per capita wealth and great natural resources allow no legitimate excuse for the growth of such a class. But there is a grave danger of the growth of slums in Canadian cities. Indeed, they already exist, as bad and as vile as can be found anywhere.

It should not be forgotten that anarchy, civil discord, and mob rule in its most pitiless and hideous aspect, lurks and awaits its opportunity in every slum. We do not want in our Canadian cities areas from which—should for any reason the civil rule of ordered justice be paralysed, as we have seen it so happen not long ago—there will emerge the original anarch, with no stake or joy in life, to wreak destruction on peaceful homes of more fortunate people. Such areas are, however, in process of making, although there is neither necessity nor excuse for their existence.

The Editor of "Mining & Scientific Press" commenting on the confessions of the German criminals who caused the war, writes: "These German confessions ex-"hibit an entire absence of sorrow for the sufferings "brought on humanity by the war; instead, there are "repeated expressions of chagrin that the great piratic "scheme failed, and a regretful rumination over the "factors that made its success impracticable, with the "suggestion that next time there must be no such "blunders. The German leaders are entirely unre-"pentant of their crime, the details of which they "themselves have exposed. They justify the judg-"ments formed in the early months of the war, on the "basis of the information then available, and they show, "how, under an autocratic regime, a few men can play "fast and loose with the fortunes of humanity."

Mr. Rickard, in his last sentence, concisely sums up

the initial cause of the war. Three great adjacent empires were ruled by three men, one a fool, one a weakling, and the other an old man in dotage. The inevitable happened, and it was to prevent such a thing happening again that the League of Nations was conceived.

Why the conception should have failed of realization may be understood by the citizens of the United States, but is causing much bewilderment among other peoples. However, a good cause must eventually succeed, and we have great faith in the ideals of the people of the United States, because they are largely those of our own nation.

Mr. Balfour has exquisitely phrased the general feeling of the British peoples in this matter. He said: "The part of the United States in the war was noble "and disinterested, with no thought of national ambi- "tion. I had dreams that a work so nobly begun would "be effectively carried through." So had we all. And after all our hopes were only dreams.

MINSTERS OF MINES.

The Cobalt "Mining Review" remarks that the recent visit of the new Premier of Ontario, accompanied by the new Minister of Mines, "did not serve to allay the fears that the new appointment may not prove to be beneficial."

There can be no two opinions about the wisdom of the creation of a new portfolio concerned with mining and with nothing else. This action of the new Ontario government is one that should be followed by a similar concentration of ministerial duties in the federal cabinet.

As to the choice of a minister of mines we advance the opinion, with which, on principle, we do not see how the United Farmers of Ontario can quarrel, that the proper person for such office is a man who, firstly, should be a properly qualified mining engineer, and, secondly,, should never have been in "politics" as that elastic term is commonly understood amongst us. Possibly this opinion will be regarded as too advanced—or shall we say—too elementarily correct, even for the U. F. O. We have never been able to understand why the responsible ministers of state should be chosen from amongst those who have been prominent in electoral activities, and are also inclined to believe that a minister of agriculture should be a farmer, a minister of finance, a financier, a minister of education, an educationalist, or, in short, that those who direct technical department of state should know something about the things they are going to direct.

Of course, we know that it will be said that we are ignorant of the first principles of popular control of government through electoral channels, or, less elaborately phrased, that we do not know the first thing about politics. The statement would be quite correct, but, admitting it, what does a minister of mines need to know about politics? If he knows something about the nature and operation of mines is not that the main desideratum?

BURSARIES FOR MINING & METALLURGY STUDENTS.

Elsewhere in this issue will be found an account taken from the "Industrial Australian and Mining Standard" of the generous assistance that has been given by mining companies and individuals interested in mining to the foundation of bursaries for students of mining and metallurgy. While a commendable commencement has been made in this direction in Canada, thanks to the bounty of the International Nickel Company and the Granby Consolidated Company, we do not recollect hearing of such an organized movement in Canada for the assistance of students as appears to have gathered way in Australia.

Here is an excellent opportunity for the many Canadian who have become wealthy through the yield of Canadian mines, an opportunity not only to show a spirit of gratitude for the good fortune which has befallen themselves personally, but to ensure greater monetary rewards for the future, for themselves may be, and certainly to Canada at large, because—and this is a point that cannot be too strongly urged—Canada is so little prospected, and her mineral values are so little understood, that the reward of the future will always be in exact proportion to the effort expended in scientific research upon our mineral occurrences. Science cannot progress without students, and scientific investigations cannot be carried to final success without monetary assistance.

UNIVERSITY BURSARIES FOR MINING AND METALLURGY.

Towards the end of 1915, following the suggestion of Mr. W. S. Robinson, a movement was initiated with the object of providing a fund whereby bursaries and scholarships might be offered to mining and metallurgical students in Australian Universities. In 1916-17 a sum of £5,400 was subscribed for the purpose by the following companies:—Amalgamated Zinc (De Bavay's); Broken Hill Proprietary Block 14; Broken Hill South; Electrolytic Refining and Smelting; Adelong Gold Estates; Cock's Pioneer G. and T. Mines; North Broken Hill; Mount Morgan G. M. Co.; Mount Lyell M. and R. Co.; Zinc Corporation; Hampden-Cloncurry Copper Mines; Broken Hill Proprietary Block 10; Sulphide Corporation; and the British Broken Hill Proprietary Co. This sum provided an income sufficient to allow of two bursaries of £60 each being offered to the University of Melbourne in 1917, and of a further two bursaries of like amount to the University of Adelaide in 1918. These bursaries are awarded and paid to successful students in two instalments of £30 each, at the beginning of the 3rd and 4th year of their courses, and carry a scholarship on any one of the companies' mines for one year following the completion of the University course, and a salary of £150 is paid to the successful students for that period. Provided the student responds to his work, the companies agree to obtain a suitable posi-

tion for him at an initial salary of not less than £250 per annum.

Notwithstanding that the movement was started during the war period, when so many of the most promising students had enlisted and were serving their country abroad, it proved so successful as to warrant further sums being subscribed to allow of similar bursaries and scholarships being offered to the Universities in the other States of the Commonwealth. An appeal was made to the boards of the various companies, to which a most gratifying response was made, the result being that the fund was nearly doubled. Included in this response was a donation of £500 from Howard, Smith, Ltd, on behalf of the Caledonian collieries, thus bringing this coal proprietary within the benefits to be derived from the scheme. The provision of these additional funds will permit the Board of Trustees to extend their efforts, and bursaries and scholarships on similar conditions are now being offered to the Universities of Sydney, Brisbane and Hobart. This will almost absorb the income from the invested funds. Already a number of the students who interrupted their studies at their country's call have returned, or are returning, and the inquiries show how much the scheme is appreciated. Of returned soldiers, one has been awarded a bursary, and three have been placed in positions almost equal to the scholarship. The bursaries and scholarships are awarded on the recommendation of a selection committee in each State, consisting of two professors of the University of the State, two nominees of the Trustees and a nominee of the Australasian Institute of Mining and Metallurgy.

It is felt that this bursary and scholarship fund is still incommensurate with the importance of the mining, and metallurgical industries of the Commonwealth, and it is hoped that further contributions will be received so that the scheme may be extended, not only to the Universities, but also to the various Schools of Mines and Technical Colleges outside the sphere of the Universities. The companies which, so far, have not contributed to the fund may yet do so, as the advantage of having highly-qualified young men available for special technical and research work must sooner or later be realised. As showing the changing attitude to technical education abroad, it may be stated that, quite recently, four British oil companies operating in the East subscribed £200,000 to endow a Chemical School at the Cambridge University—a munificent donation, which sum was increased by £10,000 by a generous donor, who wished to convert the pounds into guineas. The hon. secretary of the movement is Mr. F. G. T. Nicholas, of 56 Queen-street, Melbourne, who will gladly answer any inquiries.—Industrial Australian and Mining Standard

Mining Personals

Alfred R. Whitman, mining geologist, is spending a week in Cobalt in connection with a geological survey at the Genesee property.

Geo. J. Miller of the Miller Independence Mine is in Dayton on business.

L. C. Campbell, of the Lumsden Mine, has returned to Montreal after paying a visit to the property.

W. L. Penick, until recently connected with the Salt Lake City office of the Hardinge Conical Mill Company, has been advanced to the position of Northwest Sales Manager, and has gone to Spokane, Washington, to open a new branch office for the Hardinge Conical Mill Company.

BOOK REVIEW

ELECTRIC MINING MACHINERY: by Sydney F. Walker, author of "Electricity in Mining. Isaac Pitman & Sons, Ltd., London and New York. Cloth, 8 by 5½ ins., 374 pp. with index. Illustrated. 12/6 net.

Mr. Walker's work on "Electricity in Mining" was one of the pioneer works on the application of electricity to mining operations, and a comparison between the new work now issued by Pitman & Sons and the earlier book will show what great strides have been made. Mr. Walker, in the preface, writes, with correctness, that electric science advances day by day, and that it is impossible to be quite sure that everything which is on the market has been included in his book. Mr. Walker also urges the importance of employing competent electrical engineers in mine plants where large use is made of electric machines, and pleads for a recognition of the necessity to pay adequate salaries if employers are to obtain the services of really competent electricians. As all mining engineers know, to their sorrow, there are electricians and electricians. Modern electrical machinery is above all efficient. If electrical engineering applied to mining has a fault, it is in the tendency of manufacturers to take undue advantage of the nice calculations which are possible in electric machine design, and not to make sufficient allowance for the special conditions under which mining machinery must operate. This tendency makes the employment of competent electricians all the more necessary.

The book discusses the merits of various prime movers, favoring the steam turbine in general, but going fully into the use of gas producers and gas engines where the presence of suitable materials, or waste gases, indicate economy in the use of this form of primary power.

The lay-out of an electric generating station for a group of mines is explained, as also a suitable lay-out for a single mine.

The principles and design of modern electric generators and machines is made the subject of a number or chapters, and much attention is paid to the problems of transmission, the regulating of pressures and the use of measuring instruments, which Mr. Walker intimates, mine operators have shown some backwardness in installing.

Especial attention is devoted to the insulation and support of mine cables, a matter of very great importance under the conditions of strain and damp surroundings that transmission cables in mines are often subjected to. Mr. Walker mentions that aluminum is coming into favour as a conductor metal as the quantity manufactured is increased, because of its lightness. The question of weight in mine cables is important, where these have to be led down vertical openings, and require strong support.

The subsidiary uses of electricity are gone into in individual chapters. The chapter on portable electric mining lamps does not include any references to the cap type of lamp with Edison battery that is now so largely used on this side, and mentions that the hand lamp of the Ceag type is regarded as the standard in British practice. Electric winding, or what is known as electric hoisting in North America, is described, as are also the forms of electric haulage used underground. Significantly no mention is made by Mr. Walker of the trolley-haulages that are so

much used in the United States, and their adoption in English mines is unlikely. In coal mines, of course, their use is forbidden, although some of the original types of trolley locomotives have been used in British mines where gas was absent. The adaptability of electricity to secondary or auxiliary haulages is pointed out.

Electrically driven mine pumps, or ram and centrifugal type are described. Mr. Walker prefers the ram type of pump where small quantities of water have to be delivered against high lifts. The use of centrifugal pumps, electrically driven, is well adapted for emergencies.

In connection with the electric drive of air-compressors, Mr. Walker writes:

"Electricity has not completely superseded com-"pressed air, principally because of the dangers of "sparking and the ignition of gas, which mine man-"agers fear very much. With the steady increase in the use of electric drive in mines, the question of the "driving of air-compressors has naturally come up, "particularly as for some time past now the practice "has been introduced of driving air compressors "underground, as near to the apparatus that is to use "it as is safe, the compressed air being taken from "there to the working face, or wherever it may be "required."

This reference has an interesting bearing on the working of undersea coal areas remote from the point of entrance of motive power, and electricity appears to be the only suitable motive power in these circumstances.

The operation of ventilating fans by electricity is mentioned, and a full chapter is devoted to electrical coal-cutting machinery. Electric signals are discussed at length, and the final chapter is on shot-firing in mines. "In the earlier days of electric lighting," says Mr. Walker, "shots were fired from the lighting "service, and according to reports from America, "this is still done the practice in some districts. The "practice cannot be too strongly condemned, quite "apart from the Coal Mines Regulation Act."

Mr. Walker's book does not discuss the objections to the use of electricity underground in coal-mines, and it would have added much interest to the book if the author had found it advisable to detail at length the objections of mine managers to the use of electricity underground, and as far as possible to reassure them. In coal mines, at any rate, the more extended use of electricity is hindered by some uncertainty and probably a good deal of misconception as to the perfection to which more electric machinery has been brought. If makers of electric machinery can provide devices that can be safely used in the presence of gas and air there is no reasonable limit to the use of electricity underground, even to the supersession of all other forms of motive power now known.

ASBESTOS, and the Asbestos Industry, by Leonard Summers, 5 by 7 ins. Cloth, 107 pp. with Index. Illustrated. Price 2s. 6d. Sir Isaac Pitman & Sons, London and New York.

This little volume is the latest addition to Messrs. Pitman's series of treatises on "Common Commodities and Industries" which now includes about twenty-five volumes.

The writer mentions in the preface the paucity of popular literature dealing with asbestos, and in this connection we may mention that this "Journal" has recently had its attention called to the scarcity of Fritz Cirkel's monograph on Asbestos published by the Mines Branch at Ottawa. In view of the great development that the asbestos industry has undergone in the war period, and the additional uses which are every day being found for asbestos, we would suggest that either the Mines Department of Quebec, or the Mines Branch at Ottawa should consider the publication of a monograph on asbestos, dealing not only with its occurrences in Canada, but with the tremendous variety of uses to which this interesting mineral is now put, similar to the monograph on "Cobalt and its Uses" recently issued by the Ontario Mines Department.

Mr. Summer's volume places Italian asbestos before Canadian in point of quality, but mentions that 80 per cent of the asbestos put to commercial uses in the world to-day comes from Canada. The statistics of asbestos production in the world are not complete, and only bring Canadian production up to 1908, mentioning that probably the Canadian output is now double what it was in 1908. The actual figures, as given in the preliminary figures for 1918, show that in this year Canada produced 141,463 tons of asbestos and 16,734 tons of asbestic.

An interesting resumé of the history of asbestos is given, in which it is mentioned that to-day the Amalgamated Asbestos Corporation of Canada operates mills with a capacity of 5,000 tons daily, employing 12,000 to 14,000 persons.

It is mentioned that fine quality asbestos can be spun in strands to weigh less than an ounce to the 100 yard length, and that fine cloth can be made from the fibres weighing only a few ounces to the square yard.

The uses of asbestos mentioned in the volume include steam packings and pipe-jointings, boiler insulating materials, fire-proof paints, theatre curtains, building materials, roof coverings, portable houses, lamp wicks, safety lamp gaskets, cord and twine, fire-ladders and ropes; protective clothing, such as leggings, spats, aprons, gloves, etc., used in processes where the workmen are subjected to great heat; various forms of electric insulation, fireproof asbestos papers, and a variety of things, which like the auctioneer's announcement are "too numerous to mention."

It is mentioned that the ex-Kaiser possessed a portable asbestos cottage, which indicates some prescience on his part.

Although this little volume is confessedly elementary and is largely devoted to mentioning the trade uses of asbestos, upon reading it, one realises that the future of asbestos is only beginning, that the variety of its possible uses is immense, and that Canada, occupying such a dominating position in the asbestos market, may very well look forward not only to a greater production of the raw material, but to multiplication of the industries concerned with the manufacture and marketing of asbestos in finished form.

To those who work in the asbestos industry, or are financially interested therein, this little handbook will bring much interesting and suggestive information.

The Use of Portable Rock Crushing Equipment at Mines

By F. A. McLEAN.

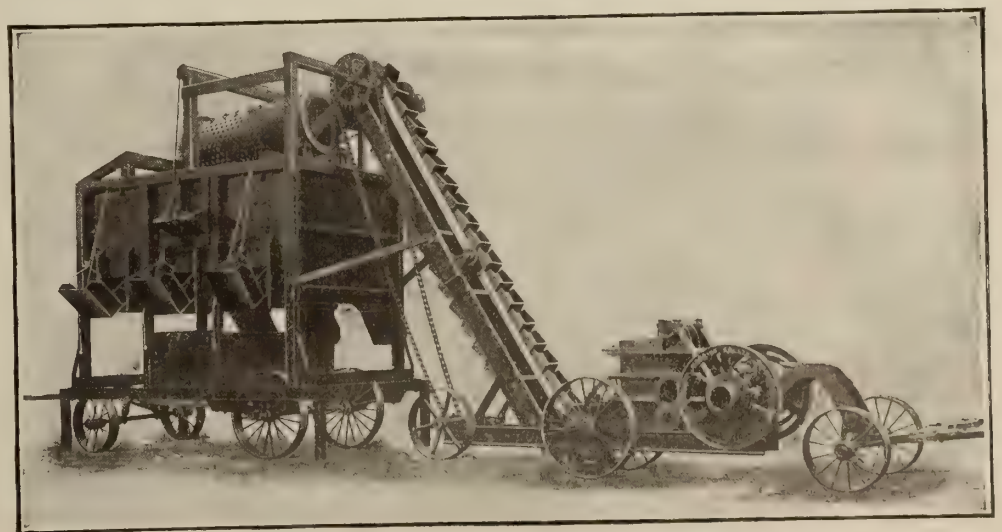
There are few things to be regretted more than the poor condition of mine roads in many parts of the country, which, due to improper drainage, or the use of too soft or porous metalling material, become a pasty and sticky mass soon after a heavy rain, requiring the expenditure of a great deal of time and money to keep them in decent order. There are not many places where a good solid sandstone or limestone ballast would not help matters to a large extent and prevent considerable trouble and loss of time, which often occurs through having to wait for a wagon heavily laden with much needed supplies to be extracted from the mire; requiring the use of horses and men who could be employed to much better advantage elsewhere about the mine.

While in many places the rock removed from the workings is well suited to the construction of good roads, and may often be the nearest source of good road-metal available to the municipalities in the surrounding country, unfortunately there are some mines in which the rock taken out is entirely unfitted for this purpose. It is sometimes possible where this condition exists, to quarry a good grade of stone from the hills adjacent to the mine and where this is not feasible, rock of the required quality can often be secured from the surface of neighboring farms. The presence of large quantities of stone on these farms reduces their productive capacity to a large extent, and the farmers—after decorating their land with numerous rock piles and large stone fences—are glad to haul some of this stone to the mine for a very small sum, sometimes less than their time is actually worth rather than have an otherwise idle team of horses on their hands, and in order to clear part of their land which they wish to bring under cultivation.

Stone of this kind is particularly valuable for the construction of permanent roads as, due to the years of exposure, all soft clayey or shaley substances have long since been washed away, leaving the remaining rock durable and well suited for the purpose; and being of moderate size, it usually requires a minimum amount of crushing to render it fit for use either on roads, or in the form of an aggregate for concrete work. Whether the rock is obtained locally or brought in from a distance, it is likely to require some crushing before it can be used either for road ballasting or for concreting around the mine, and can often be run through the regular mine crushing plant, although it will generally be found far more convenient to the use for this one of the small portable rock crushing outfits now on the market, for this purpose.

While the latter type is usually associated in the minds of most people with municipal paving, and contracting jobs—on which it has made a name for itself—its possible field of utility around the mine may at first glance seem too limited to warrant its purchase by any but the largest mines, but when one considers how much more conveniently it can be moved from one place to another wherever crushed stone for roads, mine tramways, or concreting is required it is readily apparent that, in many cases the savings in time which result from its use will soon offset the cost of installing the necessary equipment. That this is true under the high cost of labor prevailing to-day, will be borne out by anyone who has ever had occasion to watch a gang of men engaged in breaking up rock by hand on a hot summer's day.

A type of portable crushing equipment which is particularly adapted to stand up under the hard knocks likely to be met with on this class of service, and which is at the same time as compact in construction and as light in weight as is consistent with the required strength and reliability, is shown in the accompanying illustration. This crusher is of an improved type the weight of which has been materially reduced by the use of steel castings wherever possible without any decrease in strength. The crusher is mounted on a steel truck, equipped with wide-tread wrought-iron wheels, and the truck frame is hung from the rear axle and connected to the front axle by side plates curved in such a way as to keep the centre of gravity low and make it easy to block up the wheels when the crusher is in operation. An extension of the frame is arranged to carry the elevator and its drive. The frame of the latter is made of wood and is equipped with a winch with which to adjust the elevator



Canadian Ingersoll-Rand Portable Crushing Outfit.

to the discharge opening of the crusher, after which the foot of the frame may be easily blocked up. A steel-bucket, chain-type elevator, fitted with adjustable take-up boxes is used and is driven by a belt from one of the crusher flywheels.

A four-compartment, 20 ton, inverted V bottom-bin, with adjustable self-closing chutes, on both sides, and weighing about 5500 pounds is generally supplied with these outfits. These bins are lined with steel plate, and the frame rests on a steel truck, carried on four iron wheels. Bolted posts are fitted to each corner of this steel truck-frame so that it may be blocked-up to relieve the wheels and axles of all strain when the bin is full. A box mounted on the truck frame provides a convenient place for the storage of tools, jacks, etc. Screens used with this equipment are generally of the rotary type, with three sizes of perforations, and are driven by a sprocket and chain connected to the elevator head-shaft.

These portable crushing-outfits are built in two sizes, the smallest of which has a capacity of 7½ to 15 tons, depending on the size of crushed rock desired, requires 15 H.P. and weighs complete with folding elevator, 10800 pounds, while the larger size weighs 12500 pounds, has a capacity of 8½ to 20 tons, and requires 20 H.P. An electric motor, a gasoline engine, or a plain slide-valve engine, mounted on a wheeled locomotive-type boiler, are suitable sources of power for the operation of these outfits, and although the latter is perhaps more reliable and is far more commonly used for the purpose, a gasoline engine has the advantage of decreasing the bulk and weight of the complete equipment and increases the portability to some extent. Where electric power is available, the location of the plant can be frequently changed with little or no trouble.

THE BURREL MASK FOR CARBON MONOXIDE.

It was generally understood that during the war the scientific investigators of the allies tried in vain to perfect a gas-mask which would eliminate carbon-monoxide from the atmosphere. Materials were found which would satisfactorily protect men against the presence of such gases as bromine, chlorine and phosgene in the surrounding atmosphere, but carbon-monoxide is a gas that it was found not only difficult to provide protection against, but even to detect in time to prevent fatal results. In making this statement it is necessary to distinguish clearly between the uses of the gas-mask and the self-contained oxygen breathing apparatus. One is merely a filter, designed to eliminate poisonous gases from the air of respiration, while the other is a device by which the wearer is rendered independent of the outer atmosphere, and carries his own breathing-air with him. Some unfortunate results have followed a confusion of the uses of these two distinct devices.

It is therefore of much interest to miners to know that a gas-mask is now on the market which it is claimed will protect the wearer against carbon-monoxide gas. This device is known as the "Burrell Gas Mask for Carbon-Monoixde," and is supplied by the Mines Safety Appliance Company of Pittsburg, Pa.

The absorbent material has been given the name of "Hopcalite," being, it is stated, a combination of substances which it is stated will at ordinary temperatures act catalytically and convert carbon-monoxide into carbon dioxide. The mask consists of a face-piece, exhalation valve, connecting tube, canister, harness and case, weighing in all three and a half pounds.

The Mines Safety Appliance Co. also offer a carbon-monoxide indicator, likewise stated to be a war-time development. The indicating fluid is contained in a glass tube, the contents of which assume a lighter or a deeper green tint according to the concentration of carbon-monoxide present, and by means of a colour scale, the approximate percentage of carbon-monoxide can be ascertained. We do not remember to have heard previously either of a mask that would give protection against monoxide, or of a workable indicator of the presence of this insidious and deadly gas, and if the two devices now being offered for sale by the Mines Safety Appliances Co. will do what is claimed for them, then a notable advance has been made in the fight against the dangers of the mine.

It is well known that the greater percentage of those who are the victims of coal mine explosions die, not from the blast itself, but from the carbon-monoxide which speedily pervades the mine air following the blast, arising from the effect of intense heat and the burning of carbonaceous materials in a supply of oxygen insufficient to complete the process of combustion to the point of forming carbon-dioxide.

In one instance, taken from the writer's own experience, the percentage of carbon-monoxide victims was not less than seventy-five of the total of those killed in a mine explosion, and there was indubitable proof that those who had died from monoxide had been exposed to its effects for not more than twenty minutes or half an hour, and were also at all times within a few minutes' distance of fresh air. In this particular explosion, when the dead men were reached, their lamps were still burning, as monoxide does not affect a flame except to slightly increase its brilliance. Had these men possessed some means of passing through the monoxide zone, only a short one, and also only a temporary one, they could have reached safety. The problem of mine rescue work following an explosion has usually presented itself to those on the surface as to how to get into the workings, so as to reach the men in the mine, but to these men the problem is, how can we get out? Often they are quite uninjured, and quite capable of helping themselves if only they can escape the carbon-monoxide.

There is also another phase which a satisfactory carbon-monoxide mask develops, namely, the use of self-contained breathing apparatus. In many cases the mine air is not entirely fouled, that is to the extinction of the percentage of oxygen necessary to support life; but it is rather poisoned, and under such circumstances the use of a carbon-monoxide mask suggests itself, and opens up many possibilities.

The idea of the "Pneumatogen," the only really lightweight self-contained breathing device that was ever put on the market, proceeded more than a desire to invent a self-rescue apparatus, that a man could take in the mine with him and keep by him for the emergency; than it did from a desire to compass the functions of the standard type of oxygen breathing- apparatus as they are now understood. It was always the writer's opinion that in the "Pneumatogen" lay the germ of the mine-rescue apparatus of the future, and the fact that the "Pneumatogen" was a German device has no bearing whatever on the points that are of importance. The combination of the know capabilities of the self-contained oxygen breathing-apparatus with the novel possibilities held out by a carbon-monoxide mask

and detector, contain much promise for the future, which there is no doubt the large body of men who are now thoroughly acquainted with the work of mine rescue and the fighting of underground fires can be trusted to develop to the great future advantage of the mining industry.—F. W. G.

MOLYBDENUM STEEL.

A cable report from England tells of the reported perfection of a molybdenum high-speed steel by Prof. John Oliver Arnold, who has for many years been at the head of the Department of Metallurgy in the University of Sheffield, and has recently retired from that position. The cabled report is taken from the "Daily Mail," not an entirely reliable organ, particularly where any regulation of the British Government is concerned, which intimates that Britain is likely to lose the benefit of Prof. Arnold's formula because under the Defense of the Realm Act it is not permitted to him to utilize the formula commercially in Britain. The cable states that Prof. Arnold will be allowed to proceed with the taking out of an American patent, "on condition that he publishes nothing concerning it." How a patent can be taken out under these conditions is not explained, and altogether the cabled account is—to put it mildly—incoherent.

The interest to Canada is supposed to consist in the large new field for molydenum that will be opened up. The following extract from the Report of the Department of Mines of Quebec for 1918 sums up most of what is at present known regarding the uses of molybdenum:

"The chief use of molybdenite is in the manufacture of ferro-molybdenum, which enters into the composition of high-speed tool steels, molybdenum tool steel possessing the same qualities as tungsten steel. The main objection to substituting molybdenum for tungsten in the manufacture of self-hardening tool steel is that to give satisfactory results, great care and skill are required in observing the proper proportions and in the annealing process. It requires about three times less molybdenum than tungsten to obtain the same effects in the tool steel, but molybdenum steel is much more liable to crack, or otherwise deteriorate in careless quenching.

Molybdenite is also used in the manufacture of chemicals, ammonium molydate, sodium molybdate, and molybdic acid.

Apart from these uses the technology of molybdenum is more or less obscure. A short time before the declaration of war, prices for molybdenite rose steadily until in 1914 it attained $3.00 and $4.00 a lb. It is surmised that this rise was due to German buyers securing stocks as a substitute for tungsten. Other uses to which molybdenum and molybdenum compounds are said to have been put to a great extent, but most of which have been alternately denied and reiterated, are manufacture of smokeless powder, stabilizers for high explosives, to prevent their decomposition and spontaneous explosion; special steels for gun linings and for rifle barrels; armour plates and manufacture of plate-piercing projectiles. Enquiries made by the United States Geological Survey from the military authorities of the Allies brought forth the fact that none of the war material manufacturers of the United States, France or England were using molybdenum in armour plates or large guns, and that numerous analysis of captured German guns showed that it was not being used by the Germans.

The French, however, used molybdenum in the manufacture of the breech blocks of some of their field guns. The alloy "stellite" may also contain a small proportion of molybdenum. The original "stellite" is an alloy of cobalt 50 to 60 per cent, chromium 30 to 40 per cent, tungsten 8 to 20 per cent. Sometimes part of the tungsten is replaced by molybdenum. A small proportion of molybdenum, less than one per cent, has also been used in the steel of some of the crank shafts and connecting rods of the "Liberty" motors for aircrafts, built for the United States War Department."

So far as can be gathered from the very little that has been published regarding molybdenum steels, the quantity of this alloy material used has hitherto been very small. Molybdenum ore is quoted nominally in New York at 75 cents per pound at the present time. Molybdenum steels are being advertised rather extensively in trade papers in the United States at the present time. It is open to anyone to experiment in alloy steels, and it is difficult to see how a formula can be patented unless it includes something new in metallurgical science. No doubt Professor Arnold will announce the results of his research work in due time, as so many important discoveries have been previously announced from the Department of Metallurgy at Sheffield University, or, as old students remember it better, the Technical School in St. George's Square. Andrews, Sorby, Hadfield, Arnold, are names that are associated with radical advances in metallurgy, and with the study of that science in Sheffield schools, and the tradotions of these schools do not tend to incline one to the belief that there can be any tendency to withhold from national benefit anything that is really important. Really some of the news that is cabled from London for Canadian consumption is almost infantile. Three examples within a week include the reported transmutation of metals by Prof. Rutherford, the "scrapping" of the new plant of the Dominion Steel Corporation, and lastly, this wierd yarn about molybdenum steel.—F.W.G.

NEW METHOD OF UTILIZING LIGNITE.

A new method of utilizing the vast deposits of low grade lignite coal, commonly known as Souris coal, which underlie great tracts of the southwestern and south-central portions of the province of Manitoba, has been successfully demonstrated by the provincial government in the power plant of the town of Souris. This plant, formerly operated on American anthracite, was remodeled by the gas engineer of the Public Utilities Commission in 1916, the new arrangement being the first of its kind on the continent. It has operated four years without hitch, showing a reduction of 40 per cent, in fuel cost, a considerable increase in efficiency, and the requirement of less labor and attention. The experiment was financed by the provincial government, but the whole cost has been absorbed by the town after demonstration that the plant was a permanent success. Coupled with the successful experiments of the Lignite Utilization Board in the briquetting of lignite coal, this gives bright promise that the enormous deposits of lignite coal, both in Manitoba and Saskatchewan, can be used to advantage, in the direction of replacement, as compared with the price of imported American coal.—C. P. R. Monthly Bull.

The Dominion Iron and Steel Company's Koppers By-Product Coke Plant at Sydney, N.S.

By C. E. Wallin, Superintendent of Coke Oven Dept.

During 1916 it became evident that the coke plant of the Dominion Iron & Steel Co. at Sydney, would be taxed to its utmost to provide sufficient coke for the Blast Furnaces then in operation, and furthermore the small size of the ovens on the plant first erected and the method of handling the coke after quenching would always militate against the production of coke at a cost which would compare favorably with coke made in more modern plants.

The importance and necessity from an economic standpoint of recovering the greatest possible percentage of by-products has been so often emphasised, notably in recent articles in this journal by Messrs. Marquard and Lucas, that there is no occasion to touch further on this phase of the subject.

To obtain a plant embodying the latest improvements in by-product operation and labour saving machinery, a contract was placed with H. Kopper's Co. of Pittsburg for the erection of two batteries of 60 ovens each, and work was commenced on the site by the By-Product Coke Company of Canada Ltd, in the spring of 1917. Construction was delayed owing to difficulty in obtaining delivery of materials but, even so, the first battery was put in operation on Oct. 12th, 1918 and the second on March 27th of the present year.

The Coal carbonized is 100% high volatile slack coal from the Dominion Coal Coy's mines and has in the raw state the following average analysis.

	Per Cent.
Volatile Matter	33.50
Fixed Carbon	57.50
Ash	9.00
Sulphur	2.50

Before being delivered to the ovens the coal is first crushed in a Jeffries roll crusher and then passed through a British Baum Washer, of 150 long tons per hour capacity, to lower the ash and sulphur contents. On its passage to the crusher the coal is screened to eliminate the fines which by-pass the crusher and mix with the crushed coal at the foot of the elevator.

The coal leaving the washer has a moisture content of approximately 11% and the following analysis calculated on a dry basis:

	Per Cent.
Volatile Matter	34.50
Fixed Carbon	60.50
Ash	5.00
Sulphur	1.60

The washed coal is delivered on to a 36″ belt conveyor and delivered to the oven bin which has a capacity of 2200 net tons of coal and is situated above and midway between both batteries.

The ovens are of the standard Koppers regenerative type and of the following dimensions.

Length between door brick	37′ 6″
Width on pusher side	15¾″
Width on Coke side	18¼″
Height from floor to top of coal	8′ 7″

and have a capacity of 11.3 tons of coal weighing 49 lbs. to the cubic foot, but the density of the coal varies somewhat owing to varying moisture content of the washed coal and percentage of fines in the slack supplied.

The batteries consist of sixty ovens each, Fig 1. each oven having independent regenerators, thus constituting a separate unit. Heating is effected by the combustion of a part of the gas generated during carbonisation, the gas being supplied alternately to the pusher and coke sides of the ovens. The gas is supplied to the 16 vertical flues on the pusher side and 14 on the coke side by means of a hollow gun brick running the entire length of the oven and having outlets on top. These outlets are fitted with nozzle brick with an elliptical orifice at which point combustion of the gas takes place. The size of this orifice varies with the position of the nozzle brick along the gun brick, the size increasing from the second nozzle on either side to the division wall of the battery to make allowance for the drop in pressure and increase in temperature of the gas during its passage through the gun brick. The largest nozzle is in the outside flue on each side on account of the large amount of heat lost through radiation at the doors. The volume of gas supplied to each battery for heating purposes is measured by 16″ x 8″ indicating and recording Venturi meters.

The necessary air for combustion is drawn, by the stack draft, through the regenerator on the side on which the gas is burning; and in doing so becomes heated to approximately 1800°F. From the regenerator it passes into the vertical flues alongside the gas nozzles. The amount of air admitted to each individual regenerator is regulated by dampers on the air box, the damper for the oven furthest away from the stack having naturally the widest opening. This makes it possible to equalise the draft conditions on each oven. A further adjustment can be obtained by altering the size of the opening, where the vertical flue joins the horizontal flue, by means of a sliding brick.

Each vertical flue can be inspected from the top of the battery by the removal of a cast iron cap and it is possible in this way to take the temperatures of the flues, examine the state of the nozzle brick and change the same if necessary, make adjustment of the sliding brick settings and generally keep a close check on the conditions under which the combustion of the gas is taking place.

The advantages to be gained from this system of oven heating are the close adjustments of gas and air with the result that the oven walls are evenly heated by the minimum amount of fuel gas. The gas is reversed every half hour, or twenty minutes in cases where extremely high flue temperatures are carried.

All the operations of reversal are carried out by means of a master control which shuts off the gas on one side, reverses the stack dampers and air openings and finally open the gas cocks on the opposite side. This control is put into operation by means of a self-winding clock which makes certain electrical connections every half hour or twenty minutes as the case may be.

The products of combustion are carried away by side flues running the length of the battery to a stack 7' 6'' in diameter and 200 feet high.

The coal is charged into the ovens from a larry equipped with four hoppers and a sufficient quantity of coal is drawn from the oven bin into these hoppers to fill the oven to the proper level. This level is regulated so as to allow contact of the gas with the heated brickwork for as short a time as possible.

After the coal is discharged from the larry into the oven, it is levelled off, the charging covers placed in position and luted down and the oven connected to the collecting main by opening a butterfly valve. Under these conditions a charge of coal can be carbonised in 18 hours, with an average flue temperature of 2470°F. The ovens are designed for a coking period of 15½-16½ hours but with a washed coal containing 11% moisture it is not deemed advisable to raise the flue temperature to the height necessary to accomplish this.

At the end of the coking period the oven is cut off the main, the doors removed by door machines on either side of the battery, and the charge of coke is pushed out into a wide dumping car of steel and cast iron construction. The car is then brought by an electric locomotive to the quenching station where the coke is subjected to a spray of water for 35—40 seconds. After draining in the car for five minutes it is discharged on to the coke wharf, the power for elevating the dumping doors being provided by an air compressor on the electric locomotive. The coke contains on an average 1.5% moisture. Figs 2, 3 and 4.

From the wharf the coke is fed into a belt conveyor which delivers it on to a ¾'' bar grizzley screen, the furnace coke and breeze being delivered direct into cars down their respective chutes. Fig 5.

The collecting main on the ovens is connected by two crossover mains to the suction main from the batteries. It is important to carry as constant a pressure as possible on the collecting main and to ensure this each crossover is fitted with a governing device known as a North Western governor. A float controlled by the gas pressure in the collecting main is set to give in the neutral position the desired pressure and any variation in the position of the float caused by a rise or fall in presure actuates a lever making electrical contact in the power circuit of a small reversing motor. The motor in turn opens or closes a butterfly valve allowing more or less gas to pass from the collecting main until the lever attains the neutral position and breaks the contact. Only one governor on each battery is in operation, the other acting as a spare.

The suction mains from both batteries unite in a common downcomer outside the by-product building.

In order to keep all mains clear of pitch which, if not removed, would eventually block the mains, a flush of hot tar and gas liquor is kept in circulation by

Fig. 3—Locomotive and Coke Quenching Car, showing a charge of coke being pushed out of the oven-chamber.

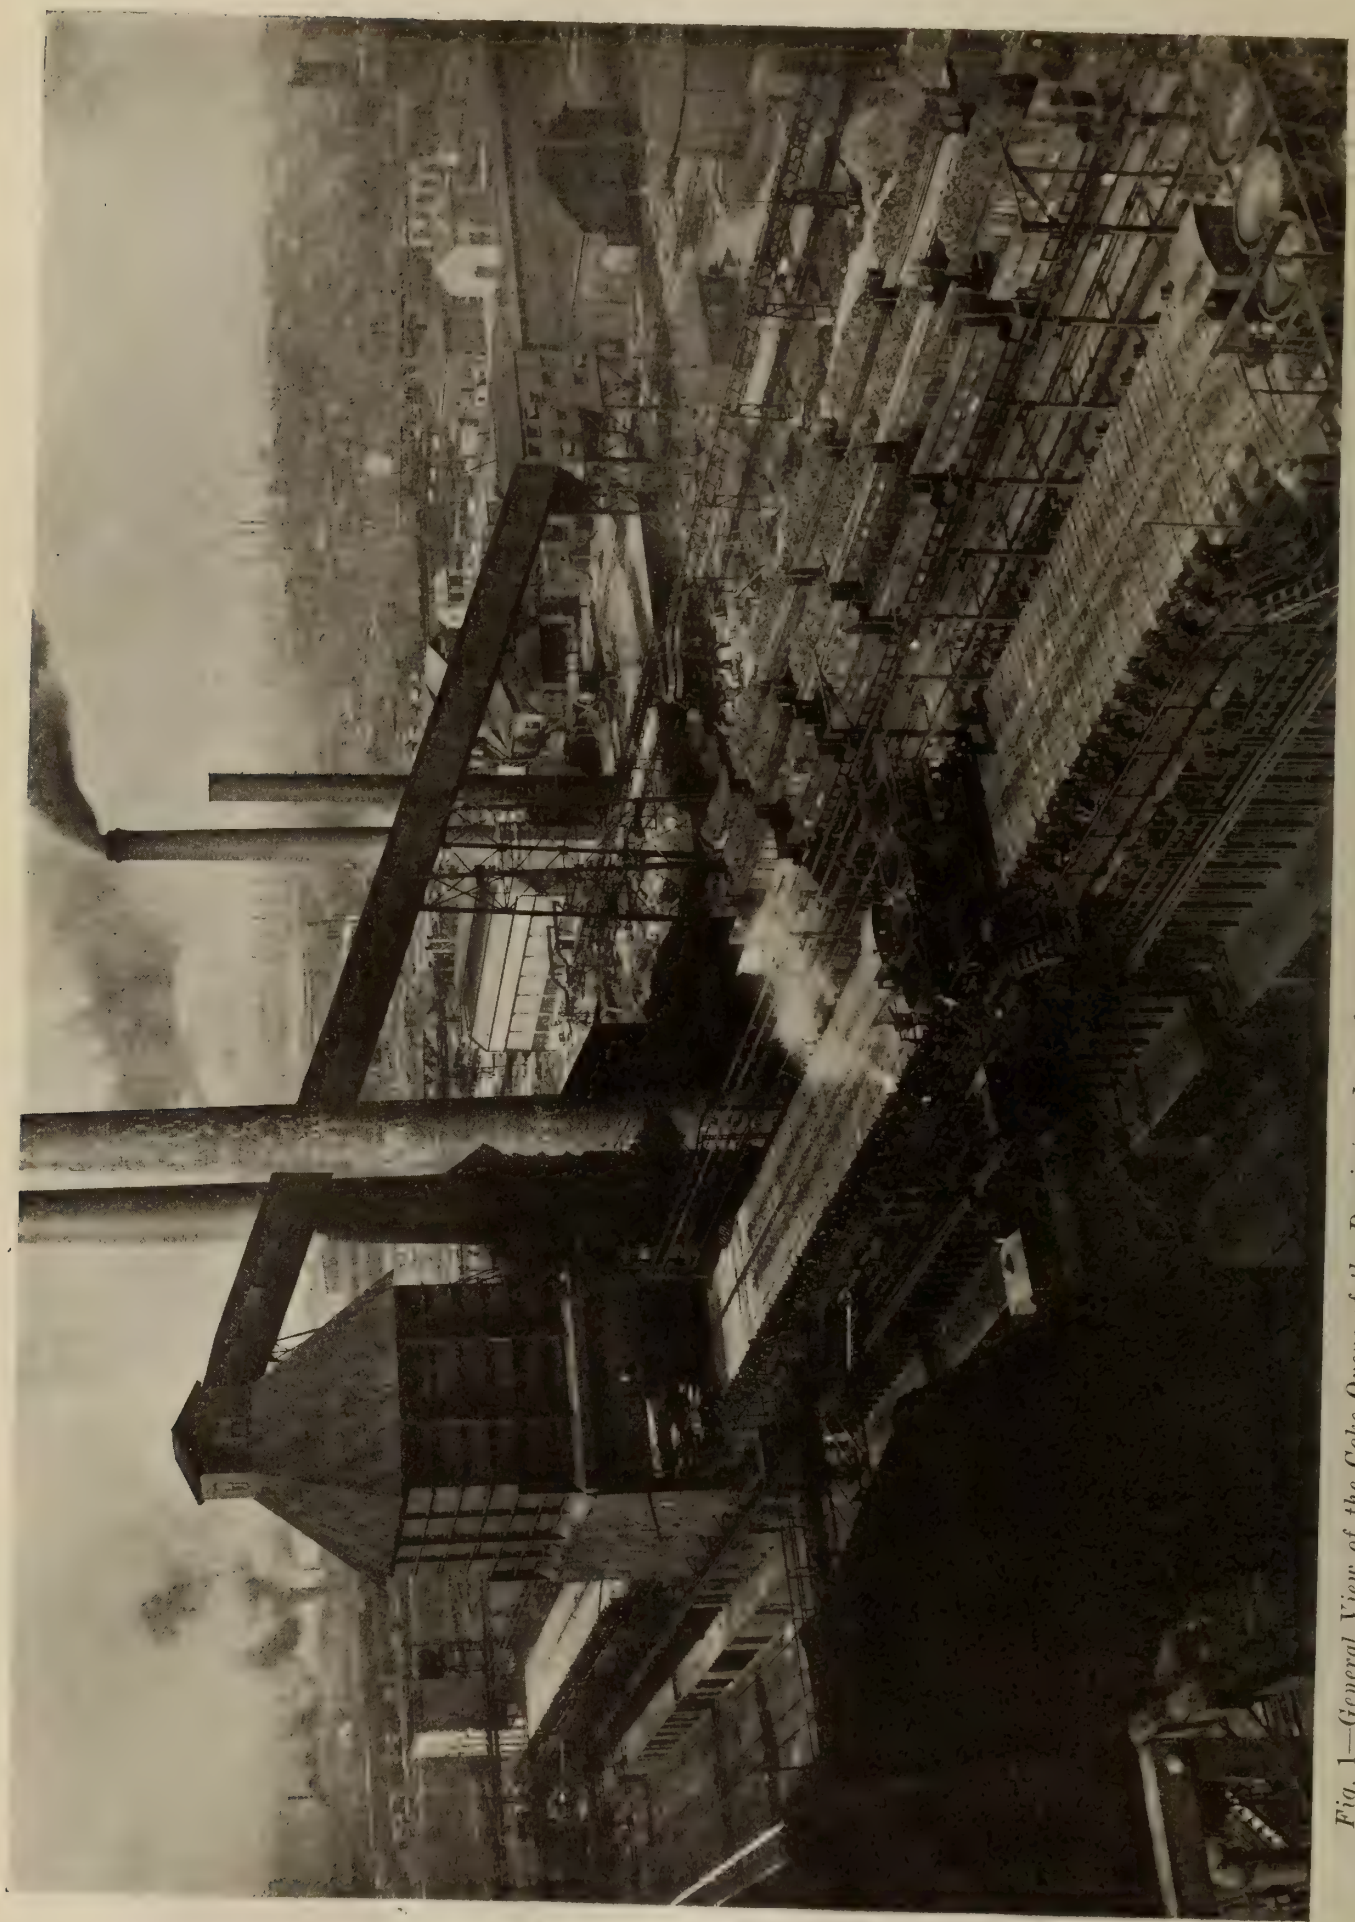


Fig. 1—General View of the Coke Ovens of the Dominion Iron & Steel Company at Sydney, Nova Scotia, showing in foreground the Koppers Ovens. Coal Pocket, Larry and Coke Sidings; and, in the distance, Sydney Harbor.

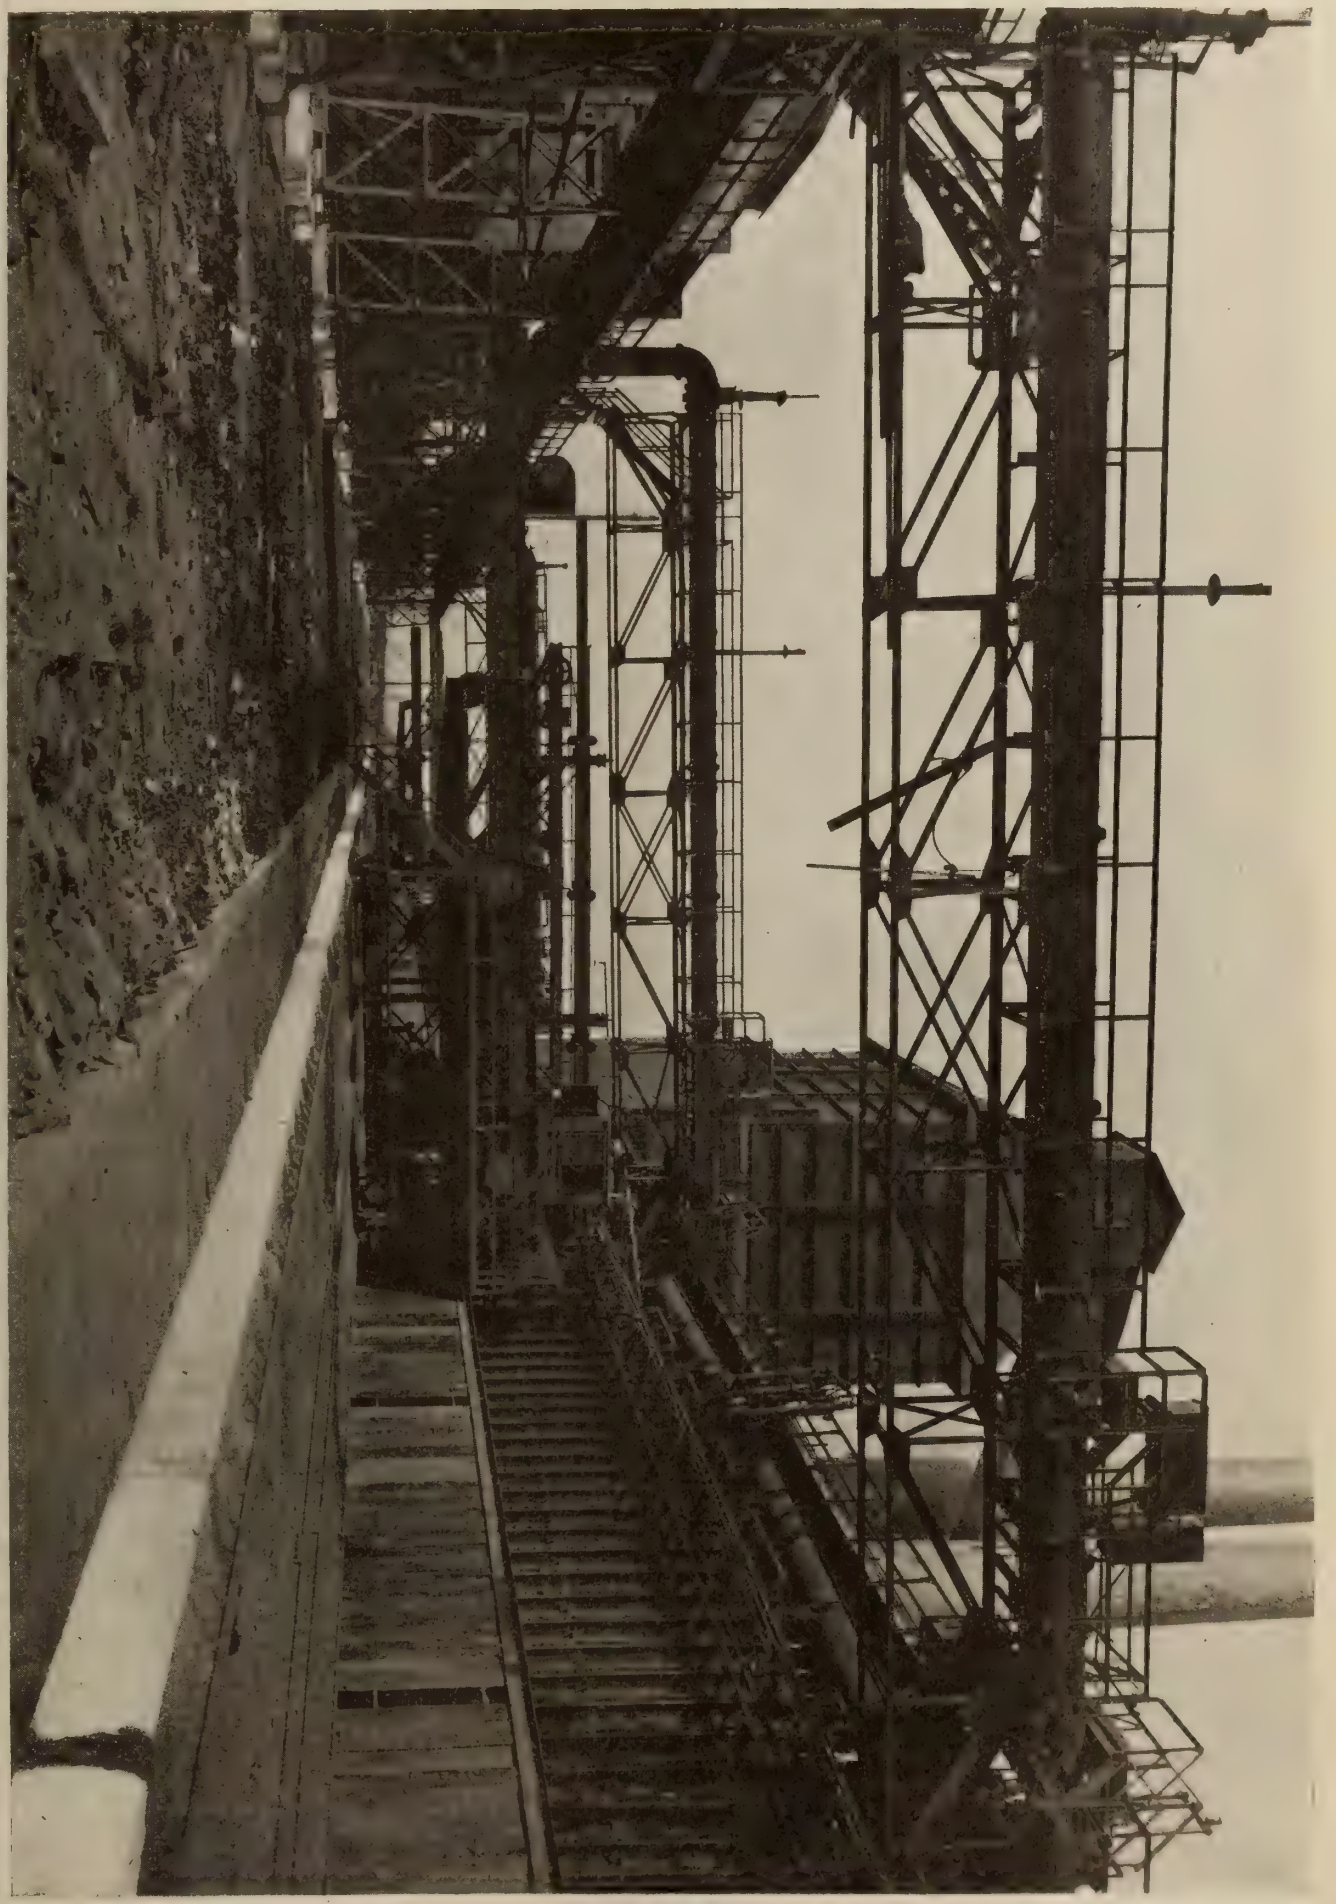

Fig. 2—Pusher Side of Ovens, showing Pusher and Pusher Track, and the Cross-over and Suction Pipe Mains.

means of a centrifugal pump, the solid matter being filtered off by suitable screens.

The gas entering the by-product building is first cooled by passing through a multitubular cooler, gas and water entering at opposite ends; the gas passing around the tubes and the water through them.

The gas temperature at the exit of the coolers is determined and kept constant by the automatic Tagliabue temperature control operating, by means of compressed air, a motor valve on the inlet water line By this means the gas is cooled down to 28°C at which temperature most of the lighter tar and water vapour is deposited and carried away to the hot drain tank to be used as a flush in the mains as mentioned above.

The gas is drawn away from the ovens by a Root's exhauster with a capacity of 700,000 cu. ft. per hour and capable of exerting a pressure of 3½ lbs., the exhauster is driven by a 20½" x 24" Fleming Engine operating at a pressure of 100 lbs, per sq. in. The engine is equipped with piston valves, the cut off being regulated by a Root's gas governor which keeps a constant suction on the main by varying the speed of the engine to deal with varying volumes of gas. In passing through the exhauster the gas is heated up to 35°C and is then led through a Tar extractor where the last traces of tar are eliminated and flow to the hot drain tank with the tar from the primary coolers. Fig. 6

The gas is next passed through a tubular reheater. and its temperature raised to 60°C by the exhaust steam from the engines, and then to the Saurator which is a cylindrical cast iron vessel lined with lead. The hot gas is carried down a vertical lead pipe inside the saturator, into a horizontal cracker pipe also of lead. The cracker pipe is of inverted U section and is slotted with vertical semi-elliptical holes through which the gas passes.

The Saturator contains a solution of Ammonia Sulphate with 7% free Sulphuric Acid and the ammonia in the gas, in passing through this bath, combines with the Sulphuric Acid forming Ammonia Sulphate, which crystallises out and is continually ejected by a compressed air syphon on to the drain table, the mother liquor flowing back again to the saturator. A continuous addition of Sulphuric Acid is made to the saturator, the amount being run in being determined by the operator who tests the free acid content of the bath at intervals of half an hour. Fig. 7.

The sulphate from the drain table is flushed in to a centrifugal dryer where it is washed with hot water and finally whizzed for ten minutes at 600 revolutions per minute. The finished sulphate averages .2% free acid and 1.5—2.% moisture and is a good white colour.

The By-Product house is equipped with three complete interchangeable sets of engines and exhausters, tar extractors, reheaters and saturators, each being capable of dealing with gas from 60 ovens, so that there is always one spare set available in case of breakdown.

Fig. 4—Quenching a charge of coke. Coke-wharf on the right.

The ammonia condensed from the gas as gas liquor, contains 50 per cent of the total ammonia and after running in to the hot drain tank with the tar, is pumped into a settling tank where the liquor settles on the top of the tar and liquor and tar are then run off into separate storage tanks. The tar thus obtained contains 2 per cent moisture.

The gas liquor is fed into a 6′ 0″ ammonia still having free and fixed stills on separate foundations, the lime necessary to decompose the ammonia salts is introduced into the bottom section of the free still, and steam for the operation is furnished by the exhaust steam from the engines at 15 pounds pressure. The flow of liquor is measured by means of a Venturi meter, 3,000 gallons per hour has been successfully treated with a loss of .015 grams per litre of ammonia in the waste liquor.

The gas liquor contains 8.2 grams per litre of total ammonia of which 75 per cent is in the fixed state.

The ammonia vapour generated is led through a covered pipe which is connected to the main gas line between reheater and saturator.

The top temperature of the still is kept constant at 99° except for 1 hour at the end of each shift when it is raised to 103°C, and at the same time the acid content of the saturator is increased. This prevents the cracker pipe and saturator becoming salted up and blocking the passage of the gas.

After leaving the saturator the pas passes through an acid separator where the traces of acid mother liquor carried by the gas are deposited, and thence to the final cooler. The cooler consists of a steel tower 60′ 0″ high and 12′ 0″ in diameter containing sets of wooden grids. The gas in its upward passage meets a descending spray of water, the cooling being accompanied by a partial deposition of naphthalene. The temperature of the gas is here reduced from 60°C to approximately 20°C., the latter temperature depending on the temperature of the cooling water, but no difficulty has been experienced in cooling the gas, if necessary, to within three degrees of the temperature of the water as shown at the inlet to the cooler.

After being cooled the gas passes through two towers of similar design to the final cooler, but 100′ 0″ high and 15′ 0″ in diameter. Here it is washed with a high boiling point petroleum oil which absorbs the Benzol vapours from the gas, 95 per cent of the total Benzol being absorbed with suitable conditions of gas and oil temperatures and oil flow.

The debenzolized gas is then passed to a holder of 40,000 cu. ft. capacity. From the holder it is delivered to the fuel mains at the batteries and the surplus gas is measured by an indicating and recording it is sent under pressure to the steel plant. The surplus gas is measured by an indicating and recording Venturi meter. Should it be necesary, at any time, to cut off the supply of surplus gas at the steel plant, the holder, when full, automatically opens a valve on

Fig. 5—Loading Coke and Breeze Simultaneously.

the bleeder line and discharges the surplus gas into the atmosphere.

The gas has the following average analysis:—

	Per cent.
Carbon dioxide	2.0
Illuminants	3.5
Oxygen	.5
Carbon Monoxide	7.0
Methane	31.5
Hydrogen	48.5
Nitrogen	7.0

The Benzolised oil is pumped to the Benzol Plant and there stripped of the Benzol and its homologues and the cooled debenzolized oil returned to be again circulated through the towers.

No description of the Benzol Plant is given as it does not form part of the Kopper's installation, but it may be stated that Benzol, Toloul, Xylol, and Solvent Naphtha of the highest degree of purity have been produced in large quantities, notably during the period of the war.

Below are given some operating statistics which may be of some interest.

	m.m. water
Suction after primary coolers	175
" before " "	85
Pressure on collecting mains	3.5
Stack draft	21.0
Gas Consumed—	cu. ft.
On ovens per hr. Pusher side	180,000
On ovens per hr. Coke side	170,000
Percentage of total gas	40%

Production (Short tons.)

	Per ton dry coal	Per 24 hrs.
Furnace Coke (lbs.)	1360	1180*
Surplus Gas (cu. ft.)	6300	10,987,000
Tar (Imp. Gal.)	11.0	19,000
Ammonium Sulphate (lbs.)	28.0	24.4*
Ammonium Sulphate loss in Saturators and Stills (lbs.)	.086	150
Light oil (Imp. Gal.)	2.9	4800
Coal charged per oven		11.0*

* Tons.

Our Northern Ontario Letter

During the past week the quotations for silver having sagged to around $1.30, rose sharply again to $1.34 an ounce at the time of writing. This is New York quotation, and is equal to around $1.45 in Canada, at prevailing high rate of exchange. Some of the leading silver producers of Cobalt can now look back to 1915, at which time they sold silver at around 46 and 47 cents an ounce, or just $1 under present quotations. At this rate the average net profit amounts to approximately 90 cents an ounce and constitutes a volume of net revenue equal to any previous period in the camp''s history.

Recent rich finds at the Crown Reserve, Beaver Consolidated, Temiskaming, as well as the rich vein opened up some months ago on the Nipissing promises to offset the natural decline in output from other sources to the end that the 1920 production may reasonably exceed that of the current year.

At the 150-ft. level of the Crown Reserve a substantial quantity of high grade ore has already been opened up as a result of the development of the new vein which was reported in these columns. Picked samples contain upwards of fifty per cent silver and a considerable amount has been bagged which runs several thousand ounces to the ton. It is learned that the company will establish a record output for December as compared with any previous month in recent years. Although not sufficient work has been done to determine the lasting importance of the new find, yet it has every appearance of being likely to continue for some distance.

The McKinley-Darragh continues to operate its flotation plant, which together with the operations underground is resulting in an average output about on a par with that of 1918. The 1918 output amounted to 904,543 ounces, and the fact that the 1919 output will about equal the preceding year in spite of the 46-day labor strike this year speaks volumes for the physical condition of the McKinley. Total production from this mine since 1906 amounts to a little over 19,000,000 ounces.

The Temiskaming Mining Company's declaration of a dividend of 4 per cent payable in January is an indication of the prosperity of that old property. The favorable developments, which date from April last, are believed to be the direct cause of the dividend being paid. The disbursement, however, is believed to be an interim one in that it is somewhat higher than the former rate and is considered too high to become a regular rate of dividend.

Producing at around $12,000 daily, and with a surplus of $4,300,000 the Nipissing Mining Company has declared a dividend of 5 per cent plus a bonus of 5 per cent, the disbursement amounting to $600,000. Although officials are reticent regarding ore reserves, yet it is reported in usually well informed circles that the ore reserves at the end of 1919 promise to have a value around $10,000,000, made up of something like 7,000,000 ounces of silver.

In a report covering the period from July 15th to December 2nd the directors of the Peterson Lake announce that the company has a surplus of current assets over liabilities of $13,094.76, as compared with almost nil one year ago. It is stated that a recent shipment of ore netted the company $13,727. It is stated that 385,000 shares of treasury stock were sold at 15 cents a share, the stock to be paid for in monthly installments. With this money, profits expected from the ore on hand and with $24,000 in the bank, the company expects that upwards of $90,000 will be avaiable for development work. This does not include the potential value of the tailings pile which the courts recently decided belong to the Peterson Lake Company.

The tailings dump on the Chambers-Ferland property has been optioned to H. Cecil and his associates for an ultimate price of between $50,000 and $100,000. Plans are being made to sample the material.

At the Adanac property one diamond drill machine continues to operate from a cross-cut at the 310-ft. level. No developments of particular interest have so far occurred.

Alfred R. Whitman, mining geologist, has been engaged to make a geological survey of the Genesee property, and commenced work late last week. The Genesee has been opened up to a depth of 500 feet, at which level considerable faulting occurred, and close to which faults, low but encouraging silver values were encountered.

The Cobalt 53 Silver Mining Company has been incorporated for the purpose of developing that piece of ground in Gillies Limit known as block 53 and on which some encouraging veins occur at surface.

The litigation in connection with the Bailey-Cobalt and the question of merging with the Northern Customs Company is still unsettled, the case having recently been heard before Justice Sutherland at Osgoode Hall, Toronto, the previous order of the assistant Master in Ordinary being refused. An appeal has been made to Mr. Justice Lennox for permission to take the case into the Divisional Court. Decision on this matter is reserved.

Regarding the recently reported negotiations between the Northern Customs Company and the La Rose, Mr. Young, President of the former company, states that no recent offer has been made.

Following is a statement of ore shipments over the T. & N. O. Ry. for the month ending November 30th, 1919. (In tons of 2,000 lbs.):

Silver Ore

Cobalt Proper	Tons
Buffalo	302.30
Coniagas	96.08
Dominion Reduction	3.00
Hudson Bay	31.60
La Rose	41.74
McKinley-Darragh	94.97
Mining Corporation	143.54
O'Brien	64.93
Trethewey	62.98
	869.14

The above shipments were made to the following Companies:

Canada		
Deloro Smelting & Refining Co.	Marmora	281.21
Coniagas Reduction Co.	Thorold	126.08
United States		
American Smelting & Refining Co	Pueblo	311.88
American Smelting & Refining Co.	Perth Amboy	55.00
Pennsylvania Smelting Co.	Carnegie	94.97
		869.14

The Gold Mines

The opinion is being freely expressed in Northern Ontario that the Dominion Government should make a special effort to induce mine operators in this country to produce more gold. It is significant to note that without any governmental assistance and confronted with an economic situation which is causing a rapid decline in output in such countries as the United States, the mine operators of this province during the last quarter of 1919 succeeded in establishing the highest record in Ontario's history. With such aggressiveness on the part of the operators, and with the physical condition of the mines commanding unbounded optimism, the situation presents a genuine opportunity for the Government to take steps to make gold mining more attractive. Stereotyped phrases such as "something should be done" are meaningless. The fact is that the gold deposits are here and gold is concentrated in values which enable operators to realize a fair profit, but that the desired number of men are not available to work the mines at capacity, and the Government does not appear to have considered it worth while to devise some scheme whereby the men could be procured.

On December 31st the Hollinger Consolidated will disburse $246,000 in dividends. On January 15th the Dome Mines will make a $100,000 disbursement. Concerning both of the two mines mention, the year 1920 appears to offer reasons for believing that new high records in point of gross production as well as net profit will be realized.

Tonnage being treated at the McIntyre is somewhat above the average for the past fiscal year, and net earnings for the current year are expected to amount to at least 20 per cent. Developments at depths continue favorable.

The mill at the Dome Lake is to be tried out this week, and the management entertains hope of being able to establish a fairly uniform rate of production. In connection with transportation to the outlying mining camps, the suggestion is being made this week by a prominent mining engineer that a "loopline" (meter gage) could be built to great advantage, commencing at Boston Creek Station, passing through the Boston Creekarea eastward through Catherine Township, through the northwest part of Skead and running north to Larder Lake. Thence turning west so as to pass through McVittie Township by way of the Argonaut mine (formerly La Mine Dor Huronia) and westward through Gauthier and Lebel to Kirkland Lake to terminate at Swastika. Such a line would be about fifty miles in length. It is suggested that the holders of mining property along the way might become bondholders in the enterprise because it would be to their mutual benefit as an accommodation and a means of more rapid development, besides assuring a saving of enormous transportation expenses.

Reports brought out from Skead township, as well as the Township of Hearst, are encouraging and indicate considerable activity. This week a new find was made in Hearst Township, close to the north boundary of Skead.

Kirkland Lake and Boston Creek districts continue active with reasonable promise of added activity with the passing of winter.

Special Correspondence

BRITISH COLUMBIA

The Collieries

John Newton, for many years District Mines Inspector with headquarters at Nanaimo, B.C., died on the 6th of December. Although ill for months he continued his official duties up to within a few days of the end, having been on a trip of inspection of the Britannia Mines, Howe Sound, when overcome. His death occurred shortly after he returned to his home city. Mr. Newton's work was almost entirely among the coal mines of Nanaimo District and he was well-known to officials and men of the Canadian Western Fuel Company and the Canadian Collieries (D) Ltd., and highly respected by all.

The position thus vacant will be filled by Henry Devlin, a long service member of the Mines' Inspection Staff, who for years has shared with the late Mr. Newton the responsibilities of the Nanaimo Inspectorate. He has had jurisdiction over the Comox and Extension Coal Mines.

Pending another appointment Mr. Devlin's place is being taken by James Dixon, a member of the Board of Examiners, and who, under the terms of a recent amendment to the Coal Mines Regulation Act, also is an Acting Inspector.

The Editor desires to add a word of personal regret upon hearing of the death of Mr. Newton. He had the pleasure of travelling with Mr. Newton from Nanaimo on the 1st of December, on the return of the party of Canadian Mining Institute members which had visited the Island collieries over the week-end, and learnt from Mr. Newton a great deal of the early history and development of the Nanaimo coalfield. Mr. Newton was quite apparently suffering from a heavy cold, and was really not fit to undertake the journey to Britannia. Mr. Newton was born near Whitehaven, Cumberland County, England, and was one of a number of men from that district who made a home in Vancouver Island, and achieved positions of responsibility through hard work and personal merit. In the course of a first and brief acquaintance, Mr. Newton impressed one as being a man of much worth, and his death, practically in harness, confirms an opinion formed upon short acquaintance, which, unfortunately, it will not now be possible to renew.

It is reported from London, England, that a re-organization of the Canadian Collieries (D) Ltd., operating collieries on Vancouver Island, British Columbia, has been decided upon and that as a result, the property will be handed over to the bond-holders; or, rather, that the changes contemplated virtually will have such an effect. On January 19th a meeting will be held to authorize the plan.

In this connection the London Times observes:

"To what extent the Company will be able to pay interest on debentures will depend upon the ability to sell the coal it can produce. The Company has coal, but the difficulty is to sell it in sufficient quantities, but trade on the Pacific no doubt will expand."

No statement has been given out by the Company's local management, whose headquarters are in Victoria.

The Canadian Collieries (D) Ltd., has extensive holdings on Vancouver Island. It has producing mines at

Comox, Extension, and South Wellington and coal rights throughout a large section of what is known as the Esquimalt and Nanaimo Railway Belt.

Officials of the One Big Union are beginning to show signs of activity again among the coal miners of the Fernie (Crow's Nest Pass(District. On December 9th a mass meeting was held at which H. Beard, president of the O.B.U., spoke. The result, according to report, is that a vote was taken as to whether the miners would stand by the O.B.U. or continue in their allegiance to the United Mine Workers of America. No official announcement of the way the vote went is obtainable. If it favored going back to the O.B.U., as seems to be the impression, it is hard to predict the outcome as the men withdrew from that organization and decided to stay with the U.M.W. of A. when the strike of the early part of this year ended. That strike lasted three months and was caused by the determination of the management of the Crow's Nest Pass Coal Company not to negotiate with the One Big Union.

Coal and its by-products was the subject of a paper by Alexander Sharp, C.E., read recently at one of a series of winter lectures being held under the auspices of the British Columbia Chamber of Mines. After speaking of the waste involved in the use of coal direct from the mine he observed that the principles of carbonizing coal should be adopted to supply cheap fuel for manufacturing and domestic purposes, then the Provincial iron ores could be melted with a coke sold at $5 a ton.

The coal returns for the month of October indicate that operators of collieries are responding to the increased demand for fuel for domestic purposes and to meet the market in the adjoining sections of the United States, which has been strengthened through the recent strike in the bituminous mines of America. In the Crow's Nest Field the Crow's Nest Pass Coal Company is back to normal in respect of its production for the first time since the month of August when the three month strike was settled. In the month of August it produced 5,344 tons of coal while in October the output had mounted to 41,284 tons. The latter figures refer only to the Coal Creek Mines. If the Michel Mines are included the October production aggregated 63,431 tons. On Vancouver Island the same condition is shown, although the increase is not so marked for the reason that there have been no labor troubles in this section. Notwithstanding, the increased demand has brought the output of the Canadian Western Fuel Co. from 49,000 odd tons in September to 59,000 odd in October. The Granby Consolidated Mining & Smelting Co.'s Mines at Cassidy, Vancouver Island, have about doubled their production, the October returns showing 11,591 tons.

The complete returns for the month of October follow:

Crow's Nest Pass Field.

	Tons.
Coal Creek, Crow's Nest Pass Coal Co.	41,294
Michel, Crow's Nest Pass Coal Co.	22,147
Corbin, Corbin Coal & Coke Co.	12,359

Nicola-Princeton Field.

Middlesboro Colliery	9,809
Fleming Colliery	3,181
Coalmont Coal & Coke Co.	401
Princeton Coal & Land Co.	2,371

Vancouver Island Field.

Canadian Western Fuel Co.	59,404
Canadian Collieries (D), Ltd., Comox	49,354
Do., Extension	18,811
Do., South Wellington	7,709
Pacific Coast Coal Mines, South Wellington	4,862
B.C. Coal Mining. Co. (Jingle Pot)	3,399
Nanoose Collieries	3,909
Granby Cons. Mining & Smelting Co., Cassidy.	11,591

BRITISH COLUMBIA'S OLDEST MINER, ROBERT STEVENSON

In attendance at all the functions of the Canadian Mining Institute meeting at Vancouver recently, and enjoying the uproarious fun of the smoker as heartily as the youngest man present, was Mr. Robert Stevenson, who received many congratulations.

The Vaucouver "Daily Province" published the following account of Mr. Stevenson's pioneering work in B. C. mining, which is of such general interest as to merit a wider circulation:

"Attending the mining convention is the oldest in point of mining experience and in years, and still actively engaged in this industry.

Pioneer of the Cariboo, Robert Stevenson, hale and active, is 81 years of age. He is well posted on mining topics of to-day, and is heavily interested in quartz propositions in the Simikameen. He makes his headquarters at Princeton every season. In fact his activity in looking after his properties in that promising mining district, and pushing the development to the producing stage would give an object lesson to much younger men in many other walks of life.

Mr. Stevenson's experiences of the Cariboo, date back to the spring of 1860, when he left Osoyoos, on the international boundary and made his way over the Cariboo trail. He had been collector of customs at Osoyoos from shortly after his arrival in British Columbia in 1859, until the lure of the rich placers of Antler, Quesnel and Barkerville, threw their spell over his imagination and he joined the north-bound caravans. Sixteen years of life in the Cariboo country saw the decline of Canada's first great placer camps. The gravel of the original creeks was all sluiced and the last dust panned.

Then Robert Stevenson removed to Chilliwack and married. He soon became interested in the Similkameen district, where he has since been active in mining. He makes his home in Chilliwack, coming there "to visit his family" as he himself puts it.

"I can ride a horse as well to-day as ever I could and as I find tramping in the hills is harder on me than it used to be. I usually make my trips on horseback," said Mr. Stevenson to a representative of The Province. "It is an advantage, for I can take a horse anywhere in the district, and get over more ground than if on foot. It takes me much less time that way,, and while I do not belong to any union, I am in favor of shorter hours as I grow older."

With Col. Donald MacGregor, Mr. Stevenson is one of the very last of the originals who worked in the old Cariboo diggings. A year older than Col. MacGregor, who only admits four-score, Mr. Stevenson, who is a powerfully-built, heavy-set man, under average weight, forms a sharp contrast to the tall spare form of his old Cariboo friend. His brother, John Stevenson, who died a few months ago after a service of twenty-two years as sheriff of Cariboo, and the old partners, May and McLean, who died in the Cariboo,

shortly after, were among the last of the old guard to remain.

Many an interesting tale of the old diggings and camps is recalled by Mr. Stevenson, as he chats of the early years of his romantic career. Conspicuously among these experiences stands out the well-known account of the "lost diggings" in the far interior, which out-Cariboo the richest claims of Cariboo's best days, and Mr. Stevenson is now the only living man who knows the location. The many causes contributing to these wonderful diggings being left untouched in all the years since the death of John Rose, who located them, form an absorbing chapter of history.

"I can find them even yet," said Mr. Stevenson, in talking of the rich find which in the end cost the life of Rose and his partner, Johnston. "I was the last man with Rose and Johnston when they set off in the spring of 1862, to return to their new diggings, which they had prospected and worked the previous year. They left from the old Antler camp—not a trace of which now remains, but where I am told much mining activity has been going on the past season.

"Rose and Johnston outfitted and took nearly twice the ordinary season's supplies on a double-decked raft or barge they built. I recall as if it were yesteday, walking down to the side of the creek, where they had their raft moord. We each carried a few last supplies. Rose turned to me, and pointing to a young man, a stranger to the camp, said, "I have invited this young man to come along. He tells me he has no money, no outfit, no blankets, not even a coat. But he looks a likely fellow, and will be a great help.

"From that moment Rose and Johnston were never again seen nor heard of. Twenty-five years later a friend of mine met a man in Portland who was, he said, on his way to the Cariboo to re-locate the old Rose diggings. He told my friend he had been the third man in Rose's ill-fated party of the spring of 1862,, and had been living in the States since that year, but had never been able to return. He invited my friend to follow and join him in the quest. But my friend could not leave Victoria. No trace of the stranger was ever again found. To this day may firm belief is that he was the young man Rose picked up the spring morning I bade him good-bye.

"But Rose had confided in me the exact location of the wonderfully rich diggings he had found, and which he said would carry a camp of several thousand men. I have never yet been able to go," ended Mr. Stevenson wistfully, "but can still locate the place."

Strong in his faith in the value of the undiscovered placer field, and in his own ability to locate it, Mr. Stevenson still cherishes the hope to be able to make the trip some day, and he is equally confident that he is as fit as many a younger prospector for the arduous season's campaign it would mean. But he will not reveal the secret of Rose's diggings.

Map of the Anyox District, B. C.

We have received a contoured map of the vicinity of Anyox, British Columbia, situated on Observatory Inlet. The map, on a scale of 1,000 feet to the inch, shows the layout of the Anyox Smelter, and the adjoining community, together with the railway, compressed air line and the buildings around the Hidden Creek Mne of the Granby Consolidated Smelting Co. Copies can be obtained from the Mines Branch at Ottawa. Publication No. is 1706.

Nova Scotia Notes

Loch Lomond Coalfield, Cape Breton

Reports in the Sydney newspapers refer to the Loch Lomond and Glengarry coalfield, and intimate that some of the larger coal companies in Cape Breton are interesting themselves in the area—a report which was later denied.

This report evidently refers to the small synclinal basin, an outlier of the main Sydney field, which lies not far from the eastern shore of the East Bay of the Bras d'Or Lake, back of Big Pond. A description and map of this small coal occurrence will be found on page 8 of Mr. J. F. K. Brown's memoir on the "Mining of Thin Coal Seams as applied to the Eastern Coalfields of Canada."* Mr. Brown calculates a possible coal content of 28,000,000 tons in the area. It is, however, one of those coal areas remote from transportation, containing thin and not easily mined seams, which form part of the natural coal reserves of a country, and which, in due time, will appreciate in value, but is not of great importance while large and undeveloped coal areas exist within easy reacch of present colliery equipment.

The most interesting part of this coal occurrence is connected with the existence of a thin strip of carboniferous measures bordering the shores of the East Bay, which suggests the possibility that some day coal seams may be found underlying the waters of the Bras d'Or Lake.

*Note.—Bulletin No. 14, Mines Branch, Ottawa.

Labour Matters

The negotiations between the coal operators and the U. M. W. are reported to be proceeding satisfactorily, with the promise of amicable settlement before the end of the year.

G. B. Burchell to Operate the Fenwick Mine

It is understood that Mr. George B. Burchell, General Manager of the Bras d'Or Coal Co., has taken over the operation of the Fenwick Colliery, in the Cumberland Field, in which the Provincial Government became financially interested during the urgent coal shortage of two winters ago. Mr. Burchell has been very successful in operating small collieries, and previous to taking over management of the Bras d'Or Mine he was for a number of years in charge of operations in the Joggins Field.

The small companies, including the Indian Cove Mine at North Sydney, the Bras d'Or Coal Company, also at North Sydney; the operations of Mr. Malcolm Beaton and partners at Port Hood, and of the Greenwood and Milford Companies in the Pictou Field have latterly been quite busy, and production during the last quarter of the year will be appreciably helped by the output of these minor operators. It is also understood that the New Campbellton Mine, in which Mr. John C. Douglas, M. P., is interested, has recently increased its production and is making satisfactory progress.

Workmen's Compensation Laws

One of the matters in which complete concurrence of opinion was obtained at the Industrial Conference in Ottawa was regarding the necessity for tne standardization of workmen's compensation laws in Canada.

The essential fairness of compensation for injuries sustained during the course of employment is not today a matter for dispute. It may be regarded as generally accepted.

There are two main divisions of administration of a compensation law. The first is based on the original British enactment, which provides for the payment of compensation for injuries received and for fatal accidents, where dependents are left, but leaves the payment of compensation to be arranged between the employer and the employee, with recourse to the courts in case of disagreement. This method of administration usually carries with it lump sum payments of compensation.

The second mode of administration is vested in a commission, which has absolute power to determine the compensation payable, under the prescription of the act, and permits no recourse to the courts. Administration by a state commission usually includes collective assessment of industries by groups, the rate being at the discretion of the Commission, and monthly payments and pensions in lieu of lump sum payment.

Administration by a state board has the following features to recommend it. It entirely eliminates recourse to the courts and avoids the necessity for the employment of lawyers. No direct contact between the employer and the employee is required, and no questions requiring agreement or disagreement between them are raised. Medical diagnosis of injuries rests with the medical officers of the state board, and in this regard a fruitful field of non-agreement is avoided. Monthly payments of compensation for injury correspond approximately with the periodical receipt of earnings, and avoids all the abuses and disasters that accompany lump payments of compensation. The payment of comparatively large sums of money to persons unable to expend it wisely has nothing to recommend it, and much to condemn it.

The administration of a compensation law by a state board is a logical evolution from the acceptance of the principle that compensation for occupational injury is a charge against the industry as a whole. The evils of bureaucratic control are admitted and well-known, but if we accept the foregoing postulate, there is no other way by which industry, as a whole, can be fairly and equitably assessed for compensation for injuries received in industry.

From the employers' side, we believe there is much to be said for the manner in which workmen's compensation is assessed and disbursed in Ontario, Nova Scotia and British Columbia. The method of group and collective assessment, after some years of experience, enables the cost of compensation to be assessed upon the payrolls with precision, and within a limited range, and in this way, employers are relieved from the uncertainty of judicial decisions, and the necessity for legal consultation and payments. In the objections which accompany the working of a compensation law such as is in force in the Province of Quebec, employers should not fail to reckon the time spent by executives in contesting conpensation cases.

The Report of the Ontario Compensation Board for 1918 contains the following:

"Complaint is made by some members of the legal "profession that they are ruled out of practice in con- "nection with claims under the Workmen's Compen- "sation Act. The Board feels that this is in accor- "dance with the spirit and intention of the Act."

In the Quebec Court of Appeal, during the sitting of the 28th October, Mr. Justice Martin, in rendering judgment in a compensation case, called attention to the fact that it had taken nine judges, nine doctors and four lawyers nearly four years to determine the nature and extent of the respondent workmen's injuries. His Lordship remarked that he quite appreciated that it was the function of a judge to interpret the law as he found it, and perhaps he ought not to suggest any changes or reforms in the law as made. "But, in the light of the facts I have mentioned." said Justice Martin, "I feel safe in asserting that if a Commissioner was to administer this Act with the assistance of an independent medical board, he would have settled and determined the whole matter in dispute between the parties in three hours."

Lawyers as a class would be the last to suggest that statutes should be framed to give them the maximum employment, and the moral pointed by these parallel statements requires no elaboration.

Not only does administration by a Workmen's Compensation Board provide impartial handling, but it leads to expeditious and skilful handling. The administrative and medical officers of a Compensation Board, handling many thousands of cases in a year, become as impersonal, as correct, and as skilful in their work as fallible men can hope to become.

No cheaper or more equitable form of administration is possible. As the 1917 Ontario Report puts it: "Practically all the money contributed by employers goes to workmen or their dependents as compensation. The administrative body has no motive to give the workmen less than he is entitled to, and no motive to charge the employer more than he should pay."

From the workmen's point of view, there is no convincing reason that can be given to him why he should receive differing treatment in regard to compensation for injury, according as he may be injured on this or that side of a provincial boundary.

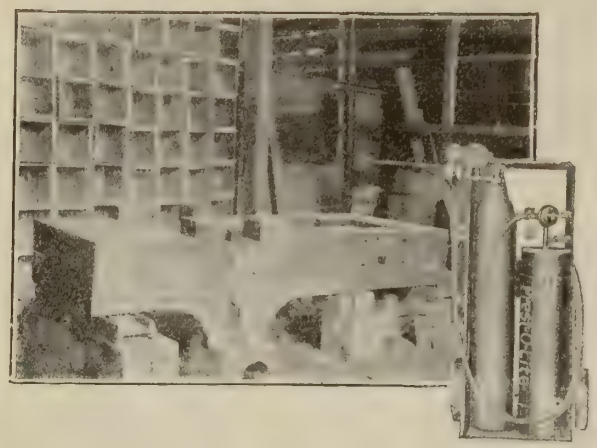
Oxy-Acetylene Welding and Cutting



3½ Ton Press Frame Repaired by Welding

In an accident this big power press frame, weighing 3½ tons, was broken in two places—the breaks occurring just below the bearing. By the Prest-O-Lite Welding Process the broken frame was repaired and ready for service in 40 hours.

Two welds, 11 inches wide and 9 inches deep, were necessary. The actual welding time was 7 hours and 40 minutes.

For repair work, as well as for manufacturing, the Prest-O-Lite Process is invaluable.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Merritton, Ont. St. Boniface, Man.

World's Largest Makers of Dissolved Acetylene

From the employer's viewpoint, it should not be forgotten that such compensation statutes as exist in Ontario, Nova Scotia, British Columbia and Alberta, take away from the workmen all common law rights by virtue of the privileges conferred in the compensation acts of those provinces. Common law liability is an uncertain and erratic one, and in some industries—most industries in fact—the menace of common law liability, as interpreted by a jury, is not to be preferred to an all-inclusive payroll assessment for compensation purposes, administered by a skilful and neutral state board which eliminates every unnecessary expenditure in administration, and avoids all issues of possible disagreement with injured workmen, or their dependents.

There is another point. Employers are human, and oftener than may be admitted by some pehaps, are humane, and the contesting of a compensation case is in many instances a distasteful business that most executives would be glad to be relieved of.—From *Iron & Steel of Canada.*

Pocket Manual on Fire-Damp Testing, Issued by the B. C. Mines Dept.

The "Journal" has received, with the compliments of the Minister of Mines for British Columbia, a very neat and handy pocket-manual of instructions in testing for fire-damp in coal mines. The heights of cap corresponding to certain ascertained percentages of fire-damp are shown by two diagrams, the flame being shown in red, and the gas-cap in blue. An interesting feature is the difference in the size of the gas-cap for the same percentages of inflammable gas (methane) in the air between the Coast and Nicola Valley Districts and the Crowsnest Pass Mines. For example a 2½ per cent content of fire-damp in the Crowsnest Pass mines will show a 5/16ths cap, where the same percentage of fire-damp in the Coast Mines would cause a half-inch cap. It is stated by those who work in the Crowsnest District that the mine gases there contain a remarkably high percentage of ethane.

The little manual of the Mines Department is contained in a buckram envelope, and is thus protected for carrying round in the vest-pocket.

WANTED

A 200 to 500 ft. cableway complete or in parts, capacity 1 to 5 tons.

An air compressor oil or gas driven, direct drive preferred capable of running 3 to 5 rock drills.

THE GLOBE AGENCY
1558 Yonge St., TORONTO, Ont.

EDITORIAL

The Undersea Extension of the Cape Breton Coalfield

A public discussion of the problems connected with the extraction of coal from the undersea coalfield of Cape Breton Island is not to be lightly undertaken without compelling reasons, for the subject bristles with difficulties, and is likely to bring in its train more kicks than ha'pence.

The public interest involved is, however, of precisely such a compelling nature as to justify some plain statements for the purpose of correcting a widespread misunderstanding of the reasons which caused the Nova Scotia Legislature to provide the machinery for the appointment of a Commission of Enquiry into the effect of the existing arrangement of the undersea lease lines upon the workability of the submarine coalfield.

There are two main sets of considerations involved. namely, legal questions, and engineering problems. So far, much prominence has been given to the legal aspects of the lease arrangements, but next to nothing has been heard of the engineering questions. Now it really happens that the primary and deciding questions are those connected with the actual winning of the coal from the undersea territory, and all the legal difficulties that have been so seriously discussed are secondary in importance, and will in fact not arise at all if the engineering problems are first examined in sincerity and decided on their technical merits.

It has been assumed that if the corporate interests that are now believed to conflict—an entirely incorrect belief in our opinion—were reconciled, that the existing difficulties would disappear. This is only partially true, because the lease difficulty is only one phase of the problem, and in this connection we would remark that the physical configuration and arrangement of the undersea lease lines is so contrary to any arrangement that ordinary good mining practice would call for, that it has only to be explained and understood to ensure that its palpable absurdity will prevent its continuance.

The undersea extension of the Sydney coalfields is much larger in extent than the land area, and it is, we believe the most valuable and important undersea coal deposit in known existence. The conservation of this deposit is therefore of great relative importance, but to the Province of Nova Scotia it is all important, and we believe the people of that province thoroughly approve of the intention of the Local Government to appoint a competent commission, but the public will desire to have *all* the problems of the undersea coal area reviewed at this time.

The very best advice that can be obtained should be secured, and there should be no hesitancy on the score of expense in retaining the most eminent engineers known to the profession of mining.

We would emphasise the point that the problem is primarily and in all important respects an engineering one, and that none but engineers can pass upon it usefully.

Briefly the problem is this. How can the undersea coal—as yet largely intact—be mined so as to ensure that it shall be mined to the last ton, at the lowest cost, and so as to preserve the accessibility of the remoter areas in view of possible advances in the arts, and in motive powers, that may permit coal to be extracted at indefinite distances from the shore?

Long views are needed, unbiased opinions, and competent conceptions of scientific breadth and understanding. The task is worthy of the greatest masters of the science and art of mining, and if the Government will rise to the full necessities of the case, the Province will back them, and future generations of miners will acclaim their wisdom and foresight.

The present unfortunate set of conditions is nobody's fault. It is the accidental and purposeless outgrowth of years, and just happened. Any recrimination of past administrators of the public domain of the Province would be inviduous and very unfair, because any fool can be wise after the event. But the future of the submarine coalfield is not yet endangered, it being fortunately, as we have already stated, largely intact, and the Government is presently empowered to review the facts, aided by the most competent advice, and to apply such remedies as full enquiry may disclose to be applicable.

The duty imposed upon the Government of Nova Scotia is unpleasant, but it is also inescapable, and the longer the undertaking of the duty is deferred, the less happy will be the ultimate result.

Some Problems Associated with the Undersea Coalfield of Cape Breton Island

Problems Include Necessity for Re-arrangement of the Mining Privileges, Preservation of Accessibility of Remote Undersea Coal-Bearing Areas, Loss of Coal in Pillarage, Possibility of Introducing Longwall Methods and Hydraulic Stowing of Coal—Immediate Appointment of Enquiry is Urged

By THE EDITOR*

A year ago the writer expressed the opinion that the whole question of the submarine coalfield was due for review.

In the meantime, much has been said and written on this vexed question, but, unfortunately, the real point at issue has been obscured by the conflicting business aims of the two large companies which between them hold the bulk of the undersea leases lying off the eastern shores of Cape Breton Island.

The word controversy has been freely used, and it has been assumed by some, and unthinkingly accepted by many, that some dispute—the word has been used on many occasions—existed between the two rival coal companies. This assumption is wide of the mark. There is no dispute, but there is a very real and pressing problem. This problem, which the Nova Scotia Government, by virtue of the legislation of 1919, undertook to solve, and was duly authorized and instructed by both houses of parliament to solve, is much wider and graver than any conflict of interest between two commercial rivals. In order that our readers may be under no misapprehension of what is really at stake, it is necessary to make a considerable quotation from last year's review. The writer urged the appointment of a competent commission, as follows:

"A plan should be made of the whole coalfield "from Cape Dauphin to Mira Bay showing the exist- "ing submarine workings, the course of the land and "submarine outcrops, the course and nature so far "as known of the parallel folds and faults that trav- "erse the coalfield. Due consideration should be "given to the facts as disclosed by soundings at sea, "the nature of the sea-bottom, the depths of super- "incumbent strata, the spacing of the coal-seams, and "the probable extent of the submarine coalfield.

"The plan should be viewed as a whole by compe- "tent mining engineers, who should disabuse their "minds of any questions concerning lease lines, and "it should be conceived as one operation, from the "viewpoint of the owners of the coal, not the view- "point of the leaseholders.

"The conservation of the submarine coal, its pro- "tection from inundation, creep, incompetent mining, "and the preservation of its accessibility over the "maximum period of operation, should be the guid- "ing ideas, and, if this were done, it is certain that "a radical re-arrangement of the submarine leases "would result that would benefit everyboly concerned, "even those competing coal operators who do not "today apprehend the true significance of the signs "of the decadence of the local coal industry, and the "necessity for compromise and reasonableness unless "all alike are to be involved in a common future dis- "aster."

There are other matters in connection with the operation of the undersea coal areas, which the people of the Province of Nova Scotia are so fortunate as to own, that are not mentioned in the foregoing summary, and it seems proper, seeing that the Government is now empowered to appoint a Commission of Enquiry, to mention these additional considerations.

The existing regulations regarding the extraction of coal in undersea areas, which are part of the statutory law of the Coal Mines Regulation Act, prescribe the practice to be followed until a cover of 500 feet of solid strata has been attained. Beyond that depth of cover the system adopted must have the approval of the Mines Office.

Methods of Extraction Should Be Reviewed

So far, the method of extraction has been that of pillar and stall, which necessitates the leaving of pillars, the size of which is increased as the workings progress seawards, and is a matter of agreement between the operator and the Inspector of Mines. Large areas of wrought territory are today standing on pillars and one matter that would form a proper question for investigation is whether the present system of pillar and stall mining is a necessary one, or the best one to be followed. Writing in 1916, the writer stated:

"If it is found necessary to leave permanent pillars "in submarine workings, this will entail the com- "plete loss of the coal contained in the pillars, and it "will also bring into operation the limitation of ex- "traction by the increased cost of mining at an ear- "lier date than if it is found possible to dispense with "permanent pillars, as the existence of a large area "of permanently abandoned workings supported by "pillars increases all mining costs, particularly that "of ventilation, and adds an element of danger that "is not present where the abandoned waste is com- "pletely filled, either by complete subsidence of the "roof, or by some method of stowing."

There are two instances in Canada where undersea coal is being completely extracted by the longwall method in one operation without leaving any pillars, and there can be no question of the advantages of such a method, whereever it is possible, as it ensures complete recovery of the coal, and moreover, it lessens the danger of inundation from the sea by breaks in the overlying strata, because it ensures an even and gentle subsidence of the roof. In neither of the Canadian instances in point is the thickness of the coal seam

*—Being a portion of an article prepared for the New Year edition of the "Halifax Chronicle."

so great as in the case in, for example, the Sydney Main Seam at Sydney Mines, or the Phalen Seam at Glace Bay. In Britain, very large areas of undersea coal have been successfully extracted by the longwall method; and in at least one colliery, which is under the direction of a former official of the Dominion Coal Company, the space from which the coal has been extracted—known to miners as the goaf or waste—is filled with sand and other suitable substances carried in by water, a system known as hydraulic stowing.

There are some serious technical difficulties in adapting the longwall method to a thick seam, but they are not by any means insuperable, and seams quite as thick as those which have been hitherto most extensively worked in the undersea areas off Cape Breton Island are being successfully extracted by the longwall method elsewhere. It should also be borne in mind that there are at least four seams, of somewhat lesser thickness than those hitherto worked under the sea in the Sydney field, that will some day be mined, when their turn comes, and there is no apparent reason why these seams could not be worked in one extraction without leaving pillars throughout their entire land and accessible seaward extension.

Reasons Why Submarine Problem Has Arisen

In regard to the arrangement of the leases, which the Government has recognized as being in need of remedy, and which, as the Hon. Commissioner of Mines has stated, will, if not altered "make the devel-"opment and operation of some of these areas diffi-"cult and economically impossible," it may be of technical interest to enquire why this unfortunate situation should have arisen, and some consideration of the circumstances will reveal that it has come about through the ignoring of three main principles of accepted mining. These three omissions are:

a. The statutory limitation of the discretionary powers of the Commissioner of Mines.

b. The non-application of the principle of "discovery."

c. The failure to recognize, in time, the importance of the ownership powers residing in the access to undersea minerals through the foreshore.

In what does the right of the Province of Nova Scotia to lease coal areas under the waters of the sea consist? Primarily, of course, in its ownership of the foreshore, or, to put it still more exactly, in its control of the means of access to the coal. Ownership of coal seams under the sea is a meaningless claim unless it includes free access thereto, and consequently, ownership of undersea minerals is inseparable from, and is in fact synonymous with access to these deposits.

Access being so primary a consideration, what follows? That to each advantageous point of access on the seashore there should be attached, for the purposes of mining, **all the undersea coal which can be best and most economically mined to that point of access.**

What has actually occurred? Undersea coal areas have been leased in detached blocks miles out to sea, not only without regard to the means of access, but worse still, so leased as to **block and to prevent access.**

Still less understandable, and certainly indefensible, is the fact that undersea coal areas have been leased in shapes that will prevent their being mined commercially, but most extraordinary is it to find that some of the worst examples of impractically and absurdly shaped leases are plotted on the lease map four and five miles out to sea!

It cannot be said that a system of leasing which not only permits such absurdities, but **causes** them is not in need of abolition.

It is open to doubt that where—as already shown—the only actual value of the undersea coalfield to the Province resides in its ownership of the foreshore, where the coalseams dip under the sea and give access to the seaward coal, whether the Province had any actual prescription to do more than grant permission to a chosen operator on a given and defined stretch of foreshore to mine all the coal that it is possible for him to extract seawards.

In Great Britain, the question of the ownership of the undersea coal has not been raised, because it has been realized that it necessarily attaches to the ownership of the foreshore. Each operator in Great Britain, along a given stretch of foreshore, mines coal from under the sea by virtue of a special lease from the Crown, applicable to his particular circumstances, and the requirements of the locality, and capable of modification to meet changing conditions. The representative of the Crown is therefore an officer with discretionary powers, and it is his duty to make the best possible bargain for the Crown that each individual set of conditions will allow.

Commissioner of Mines in Nova Scotia Has No Discretionary Powers

The position of the Commissioner of Mines for Nova Scotia, under the existing lease laws, gives him no discretionary powers whatever. His office consists in applying a hard and fast general regulation to varying conditions of great complexity connected with the leasing of coal under the sea, such general regulation having been originally designed to cover the conditions connected with the leasing of coal under land areas, and even then, applicable to only one set of circumstances. No matter how impracticable from the point of operation, nor how injurious to the interests of the Province an application for an undersea lease might be, if the application is legally made as to form, and the statutory lease rental is proferred, the Commissioner of Mines can do nothing but issue the lease. The Crown therefore has no protection against application for leases designed to block the mining operations of a competitor, **and such leases have been issued on a number of occasions.**

It is much to be questioned whether any undersea lease which has been issued by the Crown in Nova Scotia is tenable except as it retains contact with and access to the shore. The old and generally accepted principle of "discovery" in mineral claims could very well be applied to the privilege of mining the undersea coal seams.

When the Crown leases an area under the sea presumed to contain coal, is the "lease" really anything more than priority of permission to mine coal when "discovery" actually takes place? Can it be more, when the presence of coal in such a position cannot be demonstrated at the time of issuing the "lease," and is nothing more than a presumption regarding the unknown proceeding from analogy to the known?

What possible right, in fact, can the Crown possess to **lease**—in the usual understanding of that term—coal which is merely presumed to be contained in measures underlying the waters of the ocean in a detached

block situated four miles from shore? What right or justification can be advanced for leasing a detached block, such as that referred to, contained within such boundaries and having such a configuration as to render the block unworkable, and also to render unworkable the adjoining areas of other lessees should coal ultimately be discovered in the unknown area?

Leases have been given of detached blocks under the sea which were entirely surrounded by the holdings of other lessees. It is evident that a "lease" given under such conditions is in reality untenable, and is in fact not a lease at all. The Government sought to remedy this anomaly by enacting legislation which permits the lessee of a detached area to proceed through an intervening lease for the purpose of gaining access to the detached area, but the consent of the lessee of the intervening area must first be obtained and a compensation awarded for the passage. Such a method of access is however impracticable, because, firstly, it is bad mining practice and too costly, and, secondly, it would result in cutting up the intervening coal leases into a series of up-get-at-able "islands" of coal, absolutely unmineable, and of not use to anyone—indeed much worse than useless.

Should not the Government of Nova Scotia, which, by a series of fortunate accidents has inherited the ownership of the coal-seams, exercise the ordinary discretionary powers of a real estate agent in disposing of the property of the people of Nova Scotia, of which it is the steward and guardian?

Does it not seem as if the policy of the Government has been wrong, not only from the viewpoint of commonsense and engineering—the terms are interchangeable—but wrong fundamentally? Has not the lease law, designed for minerals underlying the land, been in error assumed to apply to undersea minerals, and has not the Government attempted to convey to lessees certain rights which have no certain existence? To put it another way, has not the Government issued documents giving priority of permission to mine coal in areas where it is not certain that coal exists? Has not the whole matter of the undersea coal leases been an unfortunate misconception, on which blunders have been founded which happily it is not yet too late to correct?

The Government cannot remedy the existing lease law by any half measures. It is so bad that it cannot be mended. It should be ended. An entirely new method of granting undersea mining privileges must be devised.

Apply the Principle of "Continuous Discovery"

If the principle of access is made the basis of the new arrangement, then the principle of "discovery" can be well applied by granting permission to mine coal in undersea territory to the operator whose colliery workings first reach the coal, which would mean the application of the principle of "continuous discovery," and would have as a result continuous development of the undersea coalfield under the most desirable conditions.

Commissioner of Mines Should Have Real Powers

The Commissioner of Mines should be given absolute discretionary powers, not only in the matter of granting permits to mine coal, but also in the application of the submarine law. The present hard and fast statutory regulations should be withdrawn. In any case they have no place in the Coal Mines Regulation Act. In lieu thereof the Mines Office should be vested with complete discretionary powers, which will permit of the conditions of supervision being varied and the regulations being modified to suit the ever-varying and progressive conditions of undersea coal-mining, and the widely different physical conditions accompanying the presence of coal in the several submarine coalfields. For example, it is obvious that a law which is suited to the conditions of deposition and strata existing in the Sydney coalfield is quite unsuited to the conditions at Inverness.

Let the Commissioner of Mines be given real powers. Put him in the position to act as the steward and agent of the people. No longer let his hands be tied by the dead hand of precedent, falsely and erroneously applied to conditions that have no precedent.

Past Errors Should Not Spoil the Future

Because the Government has erred in ignorance, because many men now dead have made omissions, and because certain priorities have been conferred that do not represent absolutely demonstrable values, should this error be persisted in if it means the gradual destruction of the greatest asset of the Province, the undersea coalfield of Cape Breton? This, and nothing less, will be the result of attempting to mine coal to conform with the jigsaw puzzle that is dignified by the name of the lease map of the undersea coalfield of Cape Breton.

Recall the leases of the undersea coalfield, and then re-arrange the mine territories so as to permit the workings of the existing collieries to proceed to sea as far as may prove possible. The "leases" should not be dignified by such a name. They are actually permits to mine coal on the payment of a certain royalty per ton, and the royalty could just as well be levied as a "wayleave" on each ton of coal that emerges through the shore line from an undersea colliery.

Give Maximum Life to All Existing and Future Collieries

Where stretches of the foreshore are as yet unoccupied by collieries, provide that every new colliery approved by the Commissioner of Mines shall be given free access to all the seaward coal. Lease colliery sites on the seashore, and with them submarine areas designed to give the maximum life and the maximum extraction of coal to each colliery, and abandon the the practice of leasing unmineable and detached areas of impracticable shape situated anywhere and nowhere in particular.

Problem Must Be Solved Now or Never

The problem is capable of solution today, because only two or three of the undersea coal seams have been mined in the subarine areas. In some sections of the coalfield, however, there are from seven to eight workable seams, the working of which, under existing conditions would complicate the problem to an inextricable degree. A solution is possible, moreover, without endangering the vested rights or the bonded assets of any individual or corporation. A re-arrangement of mineable areas is possible that will greatly enhance the assets and increase the stability of all the interested parties, for of what use to any corporation are areas that are not mineable at a profit, and in some instances probably not mineable at all, if present conditions are permitted to continue?

Competent Commission of Enquiry Should Be Immediately Appointed

The Government should proceed to appoint the Commission of Enquiry which is authorized by Parliament, and should extend the scope of its enquiry to include all the problems of the submarine coalfield. Fortunately, in this instance the best interest of the Province is also the best interest of the operators mostly concerned, as will speedily become apparent if a scientific, impartial and complete survey of the problem is undertaken by competent persons.

MINING COAL AT GREAT DEPTH.

Sir William E. Carforth, in an address recently delivered before the Yorkshire Geological Society made some references to the problems of mining coal at great depth which are very applicable to the problems of mining coal in the undersea coalfields of Cape Breton Island, where not only will it be necessary in the future to mine coal under great depth of cover, but also at point remote from the point of entrance or generation of motive power and fresh air for ventilation.

Sir William, whose services to coal mining are such as to make his opinions carry great weight, said in the course of his remarks that modern mining had proved that in deep mines, pillars of coal became crushed and caused other complications if left in the old method of working by pillar and stall. Hence had been substituted the long-wall method with its numerous modifications of getting the coal by one operation. Deep mining had already demanded the discarding of many usages of working coal. In future, if deep coal seams were to be successfully won, a practical knowledge and utilization of certain natural laws and their effects would be obligatory to colliery officials and workmen. Whilst the long-wall method had displaced the pillar and stall system, yet the sinuous or crooked long-wall face had until recent years unfortunately been maintained in many collieries. Sir William described some of the advantages of cutting coal by machinery, the most important of which he indicated, were the reduced risk of accidents to the miners, fewer subsidences affecting surface property, and greatly increased output, per man per shift. The straight line of coal face had also opened the way for the introduction of further mechanical appliances, and the use of conveyors or continuous troughs, which enabled the collier to throw his coal from the face right on the conveyor, instead of having to fill it into tubs, and afterwards tram or push the tub for some distance to the pony road, whence it was conveyed to the mechanical haulage road. Whilst a miner with a pick and shovel was only able to get about 3¼ tons of coal per shift, with the help of coal-cutters he was able to get about 6¼ tons. With coal-cutters and conveyors combined, the production of coal per man per shift had increased to as much as 8 to 10 tons. If the thick seams of the West Riding coalfield, he said, had been to a great extent exhausted during the past 150 years, then the coal to supply domestic and industrial requirements would have to be from the thinner seams. He suggested that the question of cheap fuel in the future should form a subject for the consideration of geologists, a special class of engineers, and of mining students at the universities and technical schools. Mechanical means must be found for conveying coal long distances underground. Discussing the question of reducing temperatures so that the deepest coal seams could be worked, Sir William suggested that the experience and knowledge of the makers of modern refrigerators and of cold storage experts should be made use of. He thought compressed air, which had proved a useful means of obtaining power in working haulage engines, pumps, and other appliances, would prove of equal service in reducing the temperature of mines.

Sir William's remarks on the smaller damage to the surface, and this applies of course whether the surface is submerged or not, is direct confirmation of the views we have expressed in the "Journal" as to the suitability of the longwall system of coal extraction to the seams of the undersea extension of the Cape Breton coalfield.

Another suggestion made by Sir William is that the question of cheap fuel should be made a subject of special study by geologists, a special class of engineers and mining students. Dean Brock of the University of British Columbia recently remarked that the study of our coal deposits had been greatly neglected by geologists in Canada, and Dean Brock is right. For example the stratigraphical position of the Cape Breton coal deposits has never been fixed with absolute certainty, no really exhaustive examination of the paleontology of this deposit has ever been undertaken in recent years, no study of the earth movements has ever been attempted, and no more is known with regard to the correlation of the several basins of the Cape Breton coalfield, to say nothing of the correlation of the coalfields of Nova Scotia, than was known to Richard Brown, Sir J. W. Dawson and Sir Charles Lyell. In short, no attempt has been made to apply the greatly enlarged knowledge of coal geology that has come with recent years to any one of the coalfields of Canada. The Geological Survey has done its best, but its personnel is too limited, and the salaries which are paid to its officers are a fair index to the importance which the Canadian people attaches to economic geology. And yet, to crack an old joke, there are some people who are fools enough to put stock in these things.—Ed.

CATALOGS RECEIVED.

The Link-Belt Co. of Chicago has issued "Book No. 380, Link-Belt Electric Hoists and Overhead Cranes" and No. 375, Link-Belt Labor-Saving Elevators and Conveyors." These catalogues are fully illustrated with industrial applications of the well-known products of the Link-Belt Co.

The Aeroil Burner Co. of 400 Main St. Union Hill, New Jersey, U. S. A., issue an illustrated pamphlet describing a flame-projector device for thawing cars, hoppers, pockets, tracks, etc., which should prove extremely useful around mining yards and buildings in Winter. They seem well adapted for colliery railway yards, particularly where it is necessary to clean up switches and release traffic quickly.

The League of Nations seems to have gone a glimmering, largely through a misunderstanding by Europeans of President Wilson's powers. They conceived him to be the fully accredited representative and plenipotentiary of the nation of which he is President, but apparently that is not the case—and more's the pity.

NICKEL COINAGE AND CANADA'S NATIONAL METAL

In a letter to The Globe, published today, Professor W. G. Miller, Provincial Geologist of Ontario, makes out a strong case for the adoption of nickel coinage for Canada. He sums up his argument with these reasons: —"Nickel is the most beautiful and the most durable metal for minor coins; ;it cannot be successfully counterfeited, and it can be called Canada's national metal, since this country produces over 80 per cent of the world's output."

Commenting upon a former Globe editorial on the subject, Professor Miller says that coins of pure nickel or nickel alloys are in use by over fifty countries, Britain and Canada being "almost the only important countries that have not employed nickel in coinage." That is not very flattering to Canada, at any rate. The conservatism of Britain is not so surprising. That Canada, with the raw material within her own borders, should in the matter of nickel coinage lag behind countries that do not produce nickel is as much a matter for wonder now as it was in the days when the project was first urged, and was brushed aside on various unconvincing pretexts.—*The Toronto Globe.*

Dr. Miller's Letter.

To the Editor of The Globe: During the last month the subject of nickel coinage has been receiving much attention from the press of Toronto and elsewhere. Your own editorial of the 12th instant induces me to address you on the subject. There are a few points concerning which there seems to be a misapprehension:

(1) France is not now introducing nickel coinage. She has been using it for years. In fact, Great Britain and Canada are almost the only important countries that have not employed nickel in coinage. Coins of pure nickel or of nickel alloys are in use by over fifty countries.

(2) Nickel coinage will consume only a small proportion of the nickel produced. Although this coinage has long been in use, it is believed that the total nickel employed for this purpose does not exceed 15,000 tons. France, for instance, used probably about 250 tons in 1918. In that year the production in Ontario was over 44,000 tons, and the quantity of New Caledonia nickel, refined partly in Europe and partly in the United States, was several thousand tons.

(3) France and several other countries have pure nickel coins—the kind that we should have in Canada. The United States "nickel" contains only 25 per cent of nickel to 75 of copper. It is not such a durable or attractive coin as the pure nickel ones of France and other countries. It was long after the United States coin was introduced that a process was discovered to roll, hammer and stamp pure nickel. These pure nickel coins are the most excellent that have been made, they are most durable in wear, they never oxidize, and it is simply out of the question to counterfeit them successfully.

(4) The Mint authorities will probably say that pure nickel coins are more costly to produce than are those of alloys of the metal. This is owing to the fact that pure nickel has a higher melting point than the alloys and is harder. But surely if France and other countries produce coins of this metal Canada can do so.

(5) Canada should have a pure nickel coinage for the following reasons: Nickel is the most beautiful and the most durable metal for minor coins, it cannot be successfully counterfeited, and it can be called Canada's national metal, since this country produces over 80 per cent of the world's output.

For years the officials of the Ontario Bureau of Mines have been urging the use of nickel in Canadian coinage. The present position of silver coinage is another reason for the employment of nickel coins.

Toronto. W. G. Miller.

DOMINION STEEL CORPORATION.

Col. Grant Morden, M.P. for the Brentford Division of Middlesex, has discussed the purchase by him and his associates of the controlling interest in the Dominion Steel Corporation. Previously they had large holdings in the concern, but their acquirement of the balance of the unissued capital held by the Treasury of the Corporation gives them control of the firm, with its ten millions capital. Col. Morden says: "We propose to consolidate and develop these properties to a much greater extent than ever before." He emphasized the potentialities of the companies with their 5,000 million tons of coal, and 5,000 million tons of ore, so well situated on the seaboard. Lord Furness is one of Col. Morden's associates. Col. Morden leaves for Canada next month, and will be accompanied not only by some of his associates in the deal, but also by a staff of skilled engineers, and together they will examine the working of the companies and their possibilities.—"Colliery Guardian."

PORT ARTHUR NOTES.

By J. J. O'CONNOR.

Another diamond drill has been put in operation on the Leitch iron lands on the Nepigon range. The parties having this range under option appear to be highly satisfied with the disclosures made by the drill-operations and intend continuing these operations during the winter. About three thousand feet of drilling has been performed to date.

J. A. Johnson and Senator W. H. Fowler, of the Swedish-Canadian Mines, Limited, returned to Port Arthur on the 21st from their gold property near Mine Centre. While at the Mine, Mr. Johnson let contracts for 2000 cords of wood and also contracts for the timber necessary for their 1600 feet aerial tramway, shaft house, and for remodelling the Mill. It is the intention to use coal for steaming purposes in the near future, instead of wood, until they develope the necessary water power. Senator Fowler left for Ottawa, and Mr. Johnson for Montreal on the 22nd.

The accident referred to in the "Journal" of the 17th, by which two men were killed owing to the explosion of an air receiver occurred at the Rognon Mine, Contact Bay, and not at the Northern Pyrites Mine, North Pines, as was incorrectly stated.

J. A. McVickie, former manager of the Chambers-Ferland Mine, has returned to Cobalt after spending several months in the Southern States.

THE C.M.I.—A YUKON APPRECIATION.

The Canadian Mining Institute has just dealt with the subjects of the utilization of returned soldiers for prospecting and the free importation of mining machinery. These are subjects of much concern to every mining section of Canada. Mining is the second industry in importance in the Dominion. It is second only to farming in volume of wealth produced.

Yukon shares in common with the other mining districts of the Dominion the need of encouragement of the development of her mineral resources, and will be pleased to see that the mining institute take up something practical and specific in the way of aiding the miner.

It is seldom that one hears of any plan for encouraging the miner. The daily press throughout the land teems with suggestions for aid to agriculture and schemes of getting returned soldiers, immigrants and others located on farming lands. How often does one hear of a scheme to give some practical public aid to the prospector or the man honestly struggling to open the mineral areas of the land with capital, brawn or brain.

It is high time there be some specialized effort for getting the assistance the miner requires. The farmers have forged ahead and have even formulated great political parties throughout the various parts of the continent. How about the miners? The coal miners are perhaps in advance of others in organizing and demanding consideration. The mineral miners are behind in the procession.

In Ontario the other day an entire provincial government was captured by the farmers. At the same time not one miner was elected from all that vast and tremendously important mineral producing area of northern Ontario. Why? What representation will the miner receive in the Ontario legislature? What will the miner receive anywhere if he does not get in and, like any others who desire special attention for his own wants, organize and fight for them.

The Canadian Mining Institute is one channel. It can make recommendations. Not all the recommendations of mining organizations of the past have been in accord with the best interests of the individual miner or th miner as a whole, but in the recommendation for free machinery for mining and for some plan to assist the returned soldier in the mining enterprise, the Canadian Mining Institute is on the right track.

Canada wants the best mining machinery and wants plenty of it, and it does not want to have to pay inflated values on the same in order that some protected or profiteering manufacturer might make a fat thing.

Let the mining machinery be supplied by those who can put up the best article regardless of where it comes from, and let it come in free.

Yukon has enjoyed this benefit in a degree through the efforts of its member. Yukon is about to expand its mineral operations. The more assistance it can secure on machinery imports and the more aid it can get for its returned soldier-miners, the speedier will the country advance, and the sooner will the national government share the prosperity and the faster will the gold and silver reserve which the Empire now so much stands in need increase.

London is crying for more gold and silver. Now is the chance for the various representatives of the people to take the recommendation of the Canadian Mining Institute and grant all the aid possible.

Let Yukon's various soldier, political, commercial, mining and other institutes support the movement and do so while it is warm.—*Dawson Weekly News.*

ACTIVITIES OF THE BRITISH COLUMBIA CHAMBER OF MINES.

So far this season there have been five lectures held in the lecture rooms.

December 4.—A cheaper and Better Fuel, Alexander Sharp. Read by Nichol Thompson.

December 9.—Recent Copper Smelting Practice. Prof. H. N. Thompson.

December 11.—Mine Sampling and Estimation of Tonnages, P. W. Racey, M. E.

December 16.—Preparation of Prospects for Examination, P. W. Racey, M. E.

December 18.—Ore Crushing for Concentration, Prof. Geo. A. Gillies, M. E.

The next lecture will be on January 6th, and will probably be given by Dean R. W. Brock of the University of British Columbia on "The Relationship of Geology to Mining." All the lectures given so far have created interest and have been well attended. Considerable discussion has taken place at each lecture. The Chamber of Mines deserves credit for conducting these lectures under the chairmanship of Professor J. M. Turnbull, as the dissemination of accurate information leads to a better understanding of mining problems, and a more discriminating attitude on the part of the public.

The nominating Committee of the B. C. Chamber of Mines have placed the following names before the members for election of officers for 1920.

President, Dr. Hodge of the University of British Columbia; first vice-president, W. H. Hargraves, Victoria; treasurer, William Godfrey, manager of the Columbia; first vice-president, J. M. Lay, manager of the Imperial Bank; second vice-president, W. H. Hargraves, Victoria; treasurer, Wm Godfrey, manager of the Bank of Montreal (Hasting and Richard street branch); honorary president, Col. E. G. Prior, lieutenant-governor-elect.; honorary vice-president, Hon. Wm Sloan, minister of mines; executive (fifteen to be elected) Messrs. A. M. Whiteside, C. E. Cartwright, J. M. Turnbull, J. A. Dawson, D. Read, P. W. Racey, B. G. Hawkins, G. M. Wooster, Nichol Thompson, N. W. Pirrie, W. T. Newman, Major Fleck, F. W. Crossland, R. S. Lennie, Chris. Spencer, Gordon Drysdale, H. G. McCraney, E. C. Gibson, G. S. Eldridge, R. D. Morkill and N. T. Burdick.

Mr. Dalby B. Morkill, a surveyor of Stewart, B. C. has presented the B. C. Chamber of Mines with a valuable and up to date map of recent stakings in the Salmon River Valley of the Portland Canal district. This gives the location of the Premier, Bush, Forty Nine and Big Missouri and other well known properties in this much talked of district. The map is on view and all are welcome to use it for reference.

A most important and valuable specimen of native and ruby silver from the La Rose claim at Alice Arm, B. C. has been recently received by the B. C. Chamber of Mines at Vancouver, This is on view at the Chamber of Mines exhibit. This is a part of a shipment of 23 tons sent to the Trail Smelter.

A previous shipment of ten tons to the Granby Smelter gave a return of about $1000 per ton. The owners of the claim propose to drive a 450 foot tunnel to enable them to carry on operations twelve months in the year.

Dr. E. T. Hodge, Asst. Professor of Geology in the University of British Columbia, recently lectured before the Rotary Club in Vancouver on "Geology as applied to Mining Prospects." The relations between the business men of Vancouver and the staff of the B. C. University seem to be unusually pleasant, and there seems to be a mutual desire to disseminate and to receive first-hand technical information. After all, this is one of the functions of an educational institution.

Montreal Branch of the Canadian Mining Institute

At a regular meeting of the Montreal Branch held in the evening of the 16th December at headquarters, the Chairman of the Branch, Capt. J. G. Ross, read a paper on the asbestos industry. The reading of the paper was followed by a discussion on the draft of a proposed bill entitled, "The Regulation of the Engineering Profession in Canada." The draft of this bill will be found in the June issue of the Bulletin.

ACTIVITY OF THE CANADIAN MINING INSTITUTE IN THE WEST.

The very successful meeting of the C. M. I. recently held in Vancouver has greatly stimulated interest in the Institute, and will result in a substantial addition to the membership. One significant feature of the Vancouver meeting was the presence of students from the University of British Columbia, and it is expected that the Institute will this year receive probably the greatest accession of student members in its history. The entrance in mining engineering classes at the Canadian universities have been unusually large, and everywhere the Registrars of the universities report not only a large enrollment, but a distinctly good grade of students.

At a meeting of the Western Branch of the British Columbia Division of the Institute held on November 29th, Mr. Charles Camsell was elected Secretary, succeeding Mr. George Wilkinson, who has latterly been in poor health. Mr. Camsell is Director of the Western Branch of the Geological Survey, with headquarters in Vancouver.

The officers and councillors of the Western Branch are now as follows:

Chairman: E. E. Campbell, Anyox, B. C.; Vice-Chairman: J. M. Turnbull, Vancouver, B. C.; Secretary: Charles Camsell, Vancouver, B. C.; Councillors: W. Fleet, Robertson, Vancouver, B. C.; W. M. Archibald, Trail, B. C.; Major R. W. Brock, Vancouver, B. C.; Thos. Braham, Cumberland, B.C.; Jas. Buchanan, Trail, B.C. ;A. G. Larson, Nelson, B.C.; Henry Lee, Britannia, B.C.; R. R. Bruce, Invermere, B.C.; C. C. Campbell, Phoenix, B.C.; A. G. Langley, Revelstoke, B.C.

As a direct result of the stimulus given by the Vancouver Meeting a Vancouver Branch of the Institute has now been formed. Although the plans for the formation of this new branch had been discussed for some time previous to the meeting of the 26th November, they really crystallized at this meeting. At a gathering held in the buildings of the B. C. University on December 9th the formal commencement of the Vancouver Branch was decided upon, and the following officers were elected:

Chairman: Major R. W. Brock; Secretary: V. Dolmage; Councillors: E. T. Hodge, S. J. Crocker, J. M. Turnbull, E. A. Haggen, P. W. Racey.

"A REAL MINISTER OF MINES"

Editor, Canadian Mining Journal:

Dear Editor,—I was very much gratified on reading the report in your issue of Dec. 10th (p. 930) about the speech made by a "real Minister of Mines" at the banquet of the Canadian Mining Institute held recently in Vancouver. This appears to have been a glorious old time banquet with everybody mellow, it could not possibly have been one of the dry affairs that have been in vogue lately. The "real Minister of Mines" announced that the government was offering a bonus of $3.00 per pound on all pig iron manufactured in the province from local ore. How much nicer this was of him than it would have been if he had said anything about taxes or nasty things like that! Pleasant visions arose before me of what this would mean—on a 300 ton plant $1,800,000 per day—the real Minister of Mines stated that this offer had not been taken advantage of. It seems to me that this is where the electric furnace would come in. I wonder none of the advocates of the electric furnace took advantage of it. But unfortunately the Minister reduces this to only $675 per day on a 300 ton plant and even then he does not allow it to operate on Sundays apparently, as he states that this would mean $213,975 per year. If the plant is run 317 days in the year at $675 per day that will give exactly the amount mentioned above, 365 — 48 = 317, that is, they are allowed to run one Sunday in each quarter. If that is not the way, what is it? Any information you can give on this point Mr. Editor would be much appreciated by all mining men. I remain,

Yours in suspense,

HOPEFUL READER.

Yes, it was a perfectly good banquet, but dry as—dry as a caucus of the U. F. O. We regret the error that our truly hopeful correspondent has detected, but we have always found departmental arithmetic difficult to follow.—Ed.

COAL COMPANY DISPOSES OF ITS INTEREST ON VANCOUVER ISLAND.

A deal has been put through by which the Nanoose-Wellington Coal Company of which Lewis Williams, of Seattle, is the president, becomes the owner of the interests of the Nanoose Collieries Company in the Grant Mine at Nanoose Bay, Vancouver Island. While the transfer price of the property could not be learned, it was stated that a very large amount is involved, the property being considered a most desirable one with exceedingly bright prospects for future development. The property comprises 1,200 acres including submarine area, it being the intention of the new owners, according to the statement of Mr. Williams, to commence immediately, operations in the development of the property with the object of largely increasing the output in the near future.

With this aim in view the company will start at once on construction work, the company's engineer having prepared plans for the erection of bunkers, a washer and other top works. These will involve an expenditure of $100,000. Contemporary with the surface improvements, underground development will be carried on. The new owners anticipate increasing the present output to 500 tons daily and, within a month to double the present number of employees which will mean an increased output. The coal area which the Nanoose-Wellington Coal Company is to develop was opened by the sinking of the Grant shaft.—Western Canada Coal Review.

Our Northern Ontario Letter

The Silver Camps

Perhaps one of the most noteworthy developments in connection with the mining industry of Ontario is the decision of the mine operators to organize in such a manner as to be able to voice in concise form the unanimous opinion of the mine operators, relative to questions which have a vital bearing upon the industry The movement has been under contemplation for some time, but it has been given added impetus and takes on greater importance because of the unexpected political developments in the province.

Northern Ontario, particularly the mining interests, is apprehensive over the present situation. There seems to be no reason for longer denying the fact that genuine fears are entertained that the trend of affairs in general is more or less in the direction of sectionalism. With the political arena being invaded, in quite a constitutional manner, by various sections, namel: Liberal, Conservative, United Farmers, Independent Labor, Soldier Candidates and Liberty Leaguers, the decision of the mine operators to form a completely representative organization appears to be quite in keeping with the times, and perhaps necessary to offset the possibility of unwise legislation at a time when the reins of government is in the hands of novices. The new organization may be known as the Ontario Chamber of Mines, or some such name, and will have branches in all the centres of mining activity in the province.

Activity at the silver mines continues at full blast. Due to a number of high grade discoveries it is quite evident that the silver output for the last quarter of 1919 has exceeded any previous quarer during the year.

According to the annual report of the Coniagas Mines, that company produced some 940,267 fine ounces of silver during the fiscal year ended October 31st, and received an average of $1.06 an ounce, or a total of not far under $1,000,000. This compares with an output of 954,264 ounces during the preceding year at which time the price of silver averaged 94¼ cents an ounce. It will be seen, therefore, that the 1919 record exceeds that of the previous year. This is pointed to as a remarkable achievement owing to last summer's labor strike having caused the complete loss of 47 days. The financial statement shows total assets of $652,837.84; current liabilities $204,092.01. Reserve for depreciation, $255,000. Surplus $2,103,-745.83.

At the Crown Reserve it is believed the shoot of high grade ore recently encountered will yield about $140,000. This comes as almost total profit over current earnings for the reason that the shoot was opened up during the course of proceeding with the development of medium grade mill rock. At the time of writing it is understood that upwards of 50,000 ounces have been bagged, with a rich floor yet to mine, and the picking over of some muck. The floor is expected to contain close to 20,000 ounces. With silver at around $1.34 an ounce plus the exchange on New York funds the shoot should have a value of $140,-000, as above stated.

A financial statement just received from the Nipissing Mining Company shows a surplus of $4,463,087, made up of securities amounting to $3,556,457 and ore and bullion worth $906,630. This is the greatest surplus ever accumulated by any precious metal mining company in Ontario. Until the annual statement is issued it will be impossible to secure exact figures relative to ore reserves, but it is intimated that as of the ending of 1919 the reserves will have a value of around $10,000,000.

Alfred R. Whitman, mining geologist, has completed his survey of the Genesee mine and after spending Christmas in the district returned to New York.

On account of the great demand for silver, together with the improved outlook in the Gowganda and Elk Lake districts, traffic to these outlying districts is steadily growing in volume. The disappointing information from that district this week consists of the curtailment of milling operations at the Reeves-Dobie and the definite closing down of the Camburn property at Leroy Lake. The curtailment at the former appears to be only temporary. However, these two disappointments are more than offset by the favorable progress in other directions. On the Walsh property the camp buildings and equipment are being put in shape for a comprehensive scheme of development. The property is pointed to as being one of the most promising of the prospective mines in the Gowganda field. It is located in close proximity to the Miller Lake O'Brien and the Castle.

The deal for control of the Everett property, among the purchasers of which is said to be Sir Henry Pellatt of Toronto, is stated to be making satisfactory progress. From the property of the Eastman Kodak interests, situated on the east arm of Gowganda Lake, a small shipment of ore has been made for testing purposes. The work of tunnelling into the hill from the shore of the lake is proceeding. Montreal interests which are operating the Diadem property at Bloom Lake (formerly known as the Powerful) are learned to be the interests which recently secured a working option on the Silver Lode property at the south end of Miller Lake. Work is to be carried forward aggressively.

In connection with the question of meter gauge railways for the outlying mining camps, W. E. Simpson, representing the Castle Cyanide Company, in an interview with your correspondent appeared to be quite optimistic over the project. From experience in West Australia, however, Mr. Simpson offers many reasons for much care in connection with building such lines. He emphasized the difficulty of linking up trunk lines where the gauge undergoes a change and strongly intimates the likelihood of the Gowganda line some day becoming a trunk line. In this connection Mr. Simpson said:— The Gowganda district is the past, as has been said, has suffered severely, but in spite of the neglect the merit of its mines is being proved and it looks as if the day of relief is coming quickly. Doubtless the government realizes that railways are the life sustaining arteries of every industrial community and may possibly recognize during the coming year that better transportation facilities are absolutely necessary for the exploitation of the mineral wealth not only at Gowganda but also in the belt extending indefinitely to the west in continuation of the proposed railway expansion. Sooner or later the time will come when the line at present known as the Elk Lake branch will be extended not only to Gow-

ganda but will connect the T. & N. O. Railway at Earlton with the Canadian Northern at some point about sixty or seventy miles west of Sudbury. In such an event, therefore, any deviation from standard gauge might prove a serious handicap to the whole district and its consideration is a matter of the greatest importance."

The Gold Mining Camps

The scope of gold mining operations in the various camps throughout Northern Ontario is gradually being enlarged. It is being found less difficult to procure men, although it is still impossible for some of the larger mines to get full requirements. The condition is well beyond its worst, however, and the future of the industry is certain to eclipse all achievements of the past.

At the Dome Mines, work at the 600 ft. level has resulted in the blocking out of a large tonnage of ore on the Dome Extension. In addition to this, it is stated that all is in readiness to cross-cut to the Dome Extension at a depth of 1,150 feet. The option which the Dome holds on the Dome Extension is good until March and promises to be the centre of considerable attention during the next sixty days. Provided the result of the treatment of a thousand tons or so of mill rock from the Extension proves satisfactory, and the Dome decides to exercise its option, the Extension will be taken over on a basis of 30 shares of Dome Extension for one share of Dome Mines. Opinion in Porcupine leans strongly to the belief that the deal will go through.

The opening of the new year once more adds the Dome Lake to the producing list, the mill which was damaged by fire last summer being once more in shape for operation.

The sampling of the Moneta property by the Porcupine Crown interests is proceeding and some kind of a deal is believed to be likely between these two companies, either on the basis of purchase of the Moneta by the Porcupine Crown or a merger of the two properties. In so far as the Moneta has considerable prospective merit but has no mining plant or mill, and considering that the Porcupine Crown is well equipped as regards mining and milling plant as well as having some $500,000 in ore reserves, the consolidation of these two properties would appear to be to their mutual benefit.

The output of the Hollinger Consolidated for the fiscal year ended December 31st, 1919, is unofficially estimated at approximately $7,000,000. Basing calculations on official figures which show an output of $4,839,845.49 for the first thirty-six weeks of the year, or an average of $134,440.01 a week, the indicated output for the whole year works out at $6,990,880.52. This does not take into account any increase during the closing sixteen week, and which increase would appear likely to bring the year's total to approximately $7,000,000. This compares with an output of $5,752,370.87 during the preceding year, and thus shows an increase of close to a million and a quarter dollars above the previous best year in the company's history. This record has been established at a time when the number of men available only permitted the operation of the plant at about seventy per cent capacity and holds out assurance of a further big increase in 1920 provided the desired number of men can be procured. The output to date from the Hollinger amounts to between $32,000,000 and $33,000,000. Owing to a typographical error, a former unofficial report referred to a production to date of close to $43,000,000.

In regard to the outlying gold areas, it has been suggested that if narrow gauge railways are to be given a trial, the Kirkland Lake-Larder Lake-Boston Creek-Skead Township areas comprise an ideal field in which to apply it. Such a line, some fifty miles in length, could serve all of the four districts mentioned. It would commence at Swastika and run east through Kirkland Lake, pass the Argonaut mine at Bearverhouse Lake, touch Larder Lake, and thence run south to Skead after which it would turn west through Catherine township and the Boston Creek district and terminate at Boston Creek. It is estimated that a narrow gauge railroad could be built for about $15,000 a mile and that the entire "loop" line as above mentioned could be built for about $750,000. As a means of financing the enterprise it is suggested that some 20,000 bonds each of $50 denomination be issued, and that a canvass of the property holders be made to see how many can be disposed of. The plan, if carried out, would appear likely to have the support of all small claimholders as well as operating companies in the districts affected. At any rate, the proposal has been drawn to the attention of the Ontario Government.

At the Miller Independence the new central shaft is nearing the fifth level, at which point cross-cutting will be carried out to the downward continuation of the rich ore bodies explored in the upper workings. It is estimated that the power plant will be completed and the electricity turned on before the annual meeting which will be held in Dayton during the first week of February.

A contract has been let to continue the shaft on the Kennedy-Boston from the former depth of 48 feet to the 100-ft. level. The work will probably be completed some time in February, after which lateral work will be commenced.

In the Fort Matachewan district work will be confined this winter chiefly to diamond drilling some of the leading properties inclusive of the Matachewan Gold Mines and the Robb-Clemens. On the Nelson claims in the township of Baden, some very rich gold ore is being encountered, and bids fair to enlarge the possibilities of the outlying parts of the Fort Matachewan district.

Following is an Order-in-Council passed by the Ontario Department of Mines, on December 19th, 1919:—

"Upon the recommendation of the Hon. Mr. Mills, the Committee of Council advise that the relief against forfeiture or loss of rights under section 84 of the Mining Act of Ontario, in the case of a recorded holder of an interest in a mining claim, who has enlisted for active service at home or overseas, against the King's enemies, be extended to the 1st day of January, 1921."

During the week ended December 26 two Cobalt companies shipped two cars containing approximately 130,696 pounds of ore, as shown in the following summary:—

Shipper	Cars	Pounds
La Rose	1	65,696
Dominion Reduction	1	65,000
Totals	2	130,696

During the corresponding period there were no bullion shipments.

MINING PERSONALS

R. J. Ennis, general manager of the McIntyre-Porcupine, paid a recent visit to the Gowganda district in connection with the Castle property.

Major Dunlap has returned to Cobalt after paying a brief visit to the Gowganda district.

Neil Morrison, superintendent of work at the Kells property, is spending the holidays in Haileybury.

Alfred R. Whitman, mining geologist, spent Christmas with Arthur A. Cole, before returning to New York.

Capt. Gordon W. Nicholson.

Capt Nicholson who recently returned to Toronto from overseas, was formerly in the employ of A. E. Osler and Company, Toronto. He has been elected a member of the Standard Stock Exchange and will open an office in Toronto.

The many friends in Toronto and elsewher of Major George A. Grover will be interested in learning that he has opened a law office in the Continental Life Building, Toronto, where he will be in partnership with his brother, Capt. J. I. Grover. The firm will be known as Grover & Grover. Major Grover will be remembered in the mining industry through his connection with the firm of J. B. Holden & Co., in the flotation of La Rose and Hollinger mining companies. He is a graduate in mining engineering of 1902 and graduated in law from Osgoode Hall in 1911. The Major had long overseas service, having been attached to the Princess Pats.

OUR BRITISH COLUMBIA LETTER.

The Metal Mines.

Stewart, B. C.

The bonding of the Northern Light, comprising eight claims, owned by Charles and William Bunting; the Woodbine group of two claims and fraction owned by Dave O'Leary and Charles Lake; and the Cobalt Group of three claims owned by John Hevland, is announced from Stewart, B. C. These properties, situated in the Salmon River Section of Northern British Columbia have been taken over by W. A. Melloche. M. E., for the Alquaquin Syndicate of Belgium. It is stated that Mr. Melloche has let a contract with Lynch Bros., of Seattle, Wn., to put three diamond drills on the ground in the spring.

C. F. Caldwell, a British Columbia operator of many years experience, has bonded the New Alaska, situated in Alaska, just across the boundary on Salmon River. Mr. Caldwell, who returned from the North a short time ago, states that development in the mining camp continues favorable. The New Alaska has three shown values already ranging from $25 to $35 a ton and energetic development is to be undertaken. The Montana Group has produced ore running from $70 to $100 a ton. Adjoining the New Alaska is the New Alaska Extension, which has been bonded by a Vancouver Syndicate and of which encouraging reports are received.

The road between the towns of Stewart and Hyder, the former on the Canadian side and the latter in American territory, has been completed. This has been an expensive work and has called for considerable engineering skill. The Provincial Government is responsible for the road, which was decided upon solely to extend mining men the necessary facilities for the opening up of the rich mineral region lying back of the Coast. The road is two and one-eight miles long. one and one-eights of this being the old Dominion Government approach. The remaining mile is entirely rock and threstle work skirting a steep bluff. There are three large trestles. The new road connects the Salmon and Bear River Valleys and makes the mines of either sections easily accessible to either Stewart or Hyder. Wagons or motors may now go from Red Cliff Mine, fourteen miles up the Bear River Valley to the Premier Mine, fifteen miles up the Salmon River, a distance of twenty-nine miles in all. Of course it is now being used by sleighs.

Alice Arm, B. C.

A. J. T. Taylor, President of the Taylor Engineering Company, Limited, has addressed a short report to Hon. John Oliver, Premier of British Columbia, bearing on last season's operations of the Dolly Varden Mine and Railroad. He states that the railroad was completed last September and was in continuous operation up to the 15th of December, 1919. During the period named the Company has hauled from its own mine approximately 7,000 tons of ore, and also has been able to supply transportation for all freight to its own property as well as for that destined to other properties operating in the district.

If reports in circulation in mining circles recently are a criterion of what may be expected there can be no doubt that there will be marked development

activity in the Alice Arm region next season. It has been stated that the Dolly Varden Mine has been sold to wealthy Eastern capitalists and that the majority of the other properties of the locality have been bonded. As to the Dolly Varden it is emphatically stated by Mr. A. J. T. Taylor, President of the mining company, that the mine had not been sold and that there is no present intention of disposing of it. Of the other reports it is learned authoritatively that the Tiger and Last Chance mineral claim, situated adjacent to the Dolly Varden, have been bonded by Eastern American interests and will be thoroughly explored next year.

Greenwood, B. C.

The Bell Mine, situated on Wallace Mountain, is a promising property which is being successfully operated by P. E. Crane, a graduate of the mines school at Pullman. The ore lies in narrow bodies containing high values in silver, this being characteristic not only of the Bell but of other claims in the same region. The product of the Bell contains 100 ounces of silver in a general way, although a carload shipped some time ago containing an average of 502 ounces and was sold for $17,000 after the deduction of all charges. Among other contributors of the districts are the Salt, Napanee, Rob Roy, Duncan and Bounty Fraction.

Princeton, B. C.

That the Canada Copper Corporation has proceeded with the construction of its concentrating mill and the development and equipment of the mine at Copper Mountain as far as possible without a railroad and electric energy is reported from Princeton. The Mill, has a capacity of 2,000 tons daily and is practically complete. In the meantime the construction of the railroad, which is to cost $1,000,000 or more, and of the power line, the cost of which will be at least $200,000, is proceeding steadily. Some 500 men are employed on the railroad. Half of the construction has been completed, including much of a tunnel which will be several thousand feet in length. A large gang of men is employed on the power line between Greenwood and Princeton. This work was started last Spring. It is believed that the railroad and the power line will be ready for operation by next Summer when the Canada Copper Company will be in a position to commence the production of ore and concentrates.

Trail, B. C.

The site of the copper mill of the Consolidated Mining and Smelting Co., at Trail, B. C., is being cleared for a new structure of steel and concrete, the cost of which is placed at $50,000. It will be much larger that the former mill which was destroyed recently by fire. The Company also is doubling the capacity of its machine shop.

The superintendence of the electrical department is being taken over by Mr. T. Hopkins, who for the past five years has been associated with one of the large Imperial Munition Plants in England. Owing to the fact that the scope of the electrolytic process of ore treatment is constantly widening Mr. Hopkins duties will be of first importance. His qualifications and his many years of experience specially fit him for the post to which he has been called.

Vancouver, B. C.

On behalf of the Tivani Electric Steel Company, now operating at Belleville, Ont., an offer of an iron and steel industry has been made to the City of Vancouver by A. P. Gillis on condition that the City undertakes the provision of 50,000 horse-power at $10 per H.P. with 24 hours continuous service guaranteed. If Vancouver agrees, the purchase of a bond issue of $5,000,000 for the establishment of an electric iron smelter in British Columbia, with a capacity of 200 tons per day for the first unit, and which will have open hearth furnaces and rolling mills, is assured according to Mr. Gillis. He asks that the question of guaranteeing the bonds be placed before the citizens to be accepted or rejected.

Barkerville, B. C.

The Bryce Syndicate, which is developing gold quartz properties on Proserpine Mountain, near Barkerville, now has options on the Dufferin Group of Claims as well as the Independence and Imperial Groups. This presumably pretty well rounds out their holdings and makes the property a big thing if the work now in progress results satisfactorily. Contracts for three 500 foot tunnels are under way, two of which are in over 100 feet each. A lot of surface trenching on the strike of the veins has also been done and two diamond drills are en route to the property.

Lillooet, B. C.

That the Lorne and another of the operating properties of Cadwallader Creek has been bonded by the Mining Corporation of Canada is reported on good authority. This corporation recent acquired the Pioneer Mine on the same waterway.

Victoria, B. C.

An application has been made to the Provincial Government by W. T. Ward and Associates for the cancellation of rental dues on the placer leases, situated in the Cariboo District, which charges have been accumulating during the years that W. T. Ward and John Hopper have been fighting the question of title through the courts. The opinion is expressed that Mr. Ward has a good case. No decsion, however, has been reached the matter being left in the hands of the Minister of Mines for investigation and report.

THE WESTERN COLLIEREIES

(From our Victoria Correspondent.)

An agreement is reported to have been reached between the operators and the miners of District 18, U. M. W. of A., which comprises Eastern British Columbia and the Province of Alberta. Negotiations as to wages, etc., were in progress at Calgary, Alta., for several days between representative of both sides, assisted by W. H. Armstrong, director of coal operations. The agreement reached covers an increase of 14% in the men's pay and also stipulates that only members of the United Mine Workers of America may work in the mines of District 18.

In discussing the situation Senator G. Robertson, Minister of Labor, said that upon receipt of a notice from the Dirtcor of Coal Operations that there was likely to be difficulty in the near future in the Alberta coal fields, and as such an occurrence could not but result in hardship and suffering in the western provinces which are absolutely dependent on these coal fie'ds for their winter supply of fuel, he had deemed it both important and necessary to take steps to meet the situation and to cope with it before any interruption occurred.

"I have no statement to make regarding the One Big Union," he continued, "other than contained in a letter to Henry Beard in reply to a communication that he addressed to me, a copy of which I am addressing to the press. I feel that from the information contained in my reply the public will approve and endorse the course taken by the coal operators, the United Mine

Workers, and approved by the Director of Coal Operations for the purpose of preventing as far as within their power a deliberate attempt, without cause, on the part of the O.B.U. to bring about a tie-up in the coal industry unless they were recognized. That, of course, is out of the question."

The main points in the Minister's letter to Henry Beard are that it is odviously impossible to recognize two organizations as having jurisdiction to negotiate wage agreements for the same workmen; that the United Mine Workers have a well established reputation for respecting and fulfilling agreements made; that the organization Mr. Beard represents (the O.B.U.) has by its acts and utterances of its leaders indicated no tendency to respect or fulfill any contractual obligation, and that the O.B.U. as an organization was wholly unreliable and untrustworthy. The Senator then adds: "If any action is indulged in by your organization at a time when miners have no justifiable grievance, and which would bring upon the community inconceivable hardship, those responsible for such action must expect to assume the responsibility therefor."

Reports from Calgary and other points on the prairies are to the effect that the shortage of fuel is likely to be felt more or less seriously in the western province of Canada this winter. Describing the situation in Calgary a writer points to its incongruity: with the Drumheller and Three Hills coal fields to the east; the Lethbridge and Crow's Nest Coal Fields to the south; the Bankhead and Canmore Mines to the east; and the Brazeau and Edmonton fields to the north, Calgary, having only 75,000 population, finds it hard to get enough coal for ordinary domestic use in cold weather. Of course, the trouble is that the One Big Union strike of last summer prevented the accumulation of surplus stocks and now that the demand is heavy the coal is being shipped straight from the mines to the hands of the consumer. The city of Calgary is expected to undertake the introduction of a system both to increase the production and facilitate distribution.

The Wakesiah Mine of the Canadian Western Fuel Company, which was opened up recently near Nanaimo, is producing some 200 tons of coal daily. This mine has not been doing much until lately, and the results now being obtained are considered satisfactory. The output, however, evidently is not to be allowed to remain at that level, it being the company's intention to bring it up to 600 tons a day in the course of a few weeks.

Figures issued by the Canadian Western Fuel Co. indicate that, whereas a few years ago the bulk of Nanaimo's coal was marketed in the United States, today the reverse is the case. In 1917, 41.5 per cent of the coal mined by the Canadian Western Fuel Company was sold in British Columbia. In 1918 the percentage had risen to 58.5 per cent and for the first ten months of the present year 70 per cent of the output was sold in the province. In November when the big coal strike started in the United States, this percentage was further increased. Instead of shipping more coal to the other side as might have been expected under the circumstances the company sold 75 per cent of its output in the province. The only coal going to the United States from this company's mines is coal for which contracts were made last summer, when there was not enough business in the province to take care of the output and the mines had to be kept running by seeking foreign contracts. Before the war the company sold most of its coal in the United, but when the war started this policy was changed so that when the war ceased it found itself without foreign markets and more output than it could sell to the domestic trade. This resulted in the seeking of contracts in Seattle, Wn., which since have been retained.

Reports received from the Lignite Utilization Board by the Research Council of Canada indicate that a plant will be in operation near Estevan, Saskatchewan, in August next which will turn out 30,000 tons of briquettes a year, and these briquettes will sell for about $9.40 a ton in Winnipeg, Manitoba.

This plant, it is said, will be the beginning of an industry which will, in a great measure, solve the fuel problem of western Canada, as these briquettes will be equal, ton for ton, to anthracite in heat value.

Dr. A. A. MacCallum, administrative chairman of the Research Council, instances the case of some 30,000 tons of Alberta coal of the inferior variety having been shipped to Winnipeg last year, which gave such poor results that the users declared they would have no more Alberta coal and this winter purchased their supplies across the line at higher prices. This, it was asserted, has taken place despite the fact that much of the Alberta coal is of excellent heat and keeping quality.

The Research Council of Canada has adopted a recommendation that a careful and thorough survey should be made of the oil shales of Canada under Dominion auspices.

The Council also recommends the establishment of a central bureau to collect and disseminate all possible information regarding all natural resources.

MOLYBDENUM RESOURCES OF BRITISH COLUMBIA

(By our Victoria Correspondent.)

With the announcement that John Oliver Arnold, Professor of Metallurgy at the Sheffield University, has perfected an improved method of manufacturing a higher grade of steel by a process in which molybdenum is declared to be the important factor, interest in molybdenite among mining men of British Columbia has revived. For a time during the war when the mineral was so much in demand and its value so high there was much prospecting for it, as well as for other of the rarer minerals brought into prominence at that time.

While molybdenite was found in different parts of the Province, and while in a few instances the indications were declared by engineers to be promising, no property was developed for this mineral alone. Before much progress could be made the war had ceased and the demand immediately fell off. If, therefore, Professor Arnold's announcement proves of the importance that is claimed for, it is expected that the work of discovery, of devlopment, and ultimately of steady shipping will be taken up where it stopped some time ago because of market conditions.

It was known at the time that the mineral was supposed to be very important to the allied cause that a deposit existed at Alice Arm, northern British Columbia. This was the one property of this character which had been developed to any extent. In 1918 it was in-

spected by Mr. George Clothier, Government Mining Enginer, who, in his annual report, said: "The only property on Alice Arm that I visited was that of the Molybdenum Mining & Reduction Company. This property was fully described in the Minister of Mines Report for 1916. It has been inactive ever since and I will therefore omit going into details. I was rather favourably impressed with the ore possibilities and it is to be regretted that the property should lie idle while the demand for molybdenum was so urgent. "It is understood that litigation was responsible for this inactivity, and it is not known whether there has yet been a settlement.

A little over six miles from the Grand Trunk Pacific Railway on Molybdenum Creek there is the Molybdenum Group of three claims, of the development of which the 1918 Report does not speak. In the Bear River Section is situated the Molly Group of four claims on which there has been some development and of which the engineer speaks encouragingly. Without sampling he estimates that the vein averages about 2 per cent molybdenite. "On the whole," he says, "it is a good showing, well located for transportation, and having all the natural advantages of timber, water, and of being easily developed by tunnels."

The New Hazelton Gold-Cobalt Company, whose property is situated on the western slope of Rocher Deboule Mountain is worthy of special mention in this connection. J. D. Galloway, Government Engineer, inspected and reported on this property in 1918. Describing the development he said that "a lower tunnel was started 250 feet below the main tunnel; it was driven as a cross cut for 75 feet and then as a drift on the vein. On November 1st this drift was in 149 feet and work was being continued. Throughout this working the vein carries a shoot of ore, more or less continuous, and varying in width from six to eighteen inches. The ore is a mixture of sulphides and arsenides of iron and cobalt and some molybdenite." Again he says: "The molybdenite content of the vein is quite variable. During the year a car-load of gold-cobalt-molybdenum ore, which came from the upper tunnel, was shipped to the concentration plant of the Mines Branch at Ottawa. The car contained 53,288 lb. dry weight, and the analysis on it was: Gold, 1.24 oz.; $Mo.S_2$, 1.40 per cent; $Mo.O_3$, 0.18 per cent; cobalt 1.12 per cent; nickel, 0.60 per cent; arsenic, 8.98 per cent."

Wm. M. Brewer, Government Mining Engineer, refers to "several occurrences of molybdenite ore found on Buttle Mountain Vancouver Island, near Cowichan Lake, as well as others on the mainland. Unfortunately for the discoverers none of the deposits was developed to a shipping stage previous to the signing of the armistice."

Later on Mr. Brewer deals with the Stave River Group situated in the New Westminster Mining Division, near the upper Stave Lake. He observes that it is possible that a mine of commercial importance "may be developed here, providing the vein material, which carries molybdenite, is concentrated on the ground. The extent of this material is apparently so great and the structure of the occurrence of the deposit of such character that mining operations can be carried on by quarrying, and possibly after further prospecting it will be determined that a steam shovel could be operated to advantage. While the assay results from the samples taken by the writer do not show a high percentage of molybdenite, it is quite possible that this feature may be overcome by the low cost at which mining, concentration, and transportation can be carried on."

Attention also has been directed to the property of the Index Milling & Mining Company, situated on Texas Creek, twelve miles from Lillooet. This company claims to have the highest grade molybdenite on the continent, assaying between 15 and 19 per cent. The Texas Creek Mine was opened in 1914 and taken over by the present company in September, 1918. Since then they have made cuts to 900 feet and have taken out 16 tons of ore, half of which was shipped to Ontario, while the remainder still is on the dump. All shares in this company are said to have been taken off the market.

It is apparent from these notes that British Columbia has potentialities as far as molybdenum is concerned and that if the demand should again become marked, important developments may be considered assured.

Note: As stated in last week's "Journal," the cabled despatches from England regarding Professor Arnold's reported new formula for molybdenum steel are so obviously incorrect in the main particulars, and so patently cabled with a political bias, that it will be well to await Prof. Arnold's own publication of his discovery before assuming that molybdenum deposits have assumed a new and increased value.—Ed.

BOOK REVIEW.

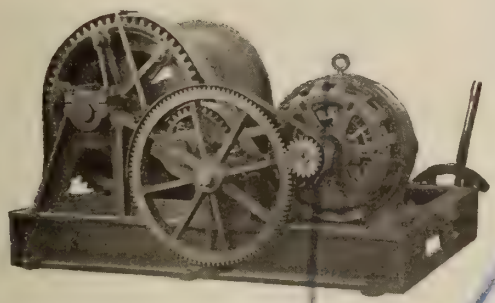
INDUSTRIAL FUELS, by J. Stephenson. Published by the Westman Press, Ltd., 72 Queen St. W., Toronto. 190 pages, 107 drawings. Paper backs, $2.25, Cloth, $3.00. 9¼ by 6 inches.

The author of this comprehensive brochure is also the author of "Elements of Water Gas," of which a second edition is in preparation, and is with the United Gas and Fuel Co. of Hamilton, Ont. As is stated in the preface, the scope of the subjects treated is unusually broad, but for executives who have the choice of several fuels and desire to make quick comparisons. the book affords a concise survey of all the better known and some of the lesser known fuels that are adapted to industrial uses. The fuels treated on include coal, natural gas, coal gas, oil gases, producer gases, coke, and fuel briquets. The application of gases as commercial sources of fuel is fully dealt with, and a chapter is devoted to fuel analysis. The concluding chapter deals with fuels of the future, including domestic garbage, and alcohol, the possible sources of fuel alcohol being enumerated.

A perusal of the work reveals an astonishing variety of fuels available for industrial uses, but we believe the most important indication afforded by the author's survey of a varied field is that the fuel of the future will tend more and more to be used in a gaseous state, or in the condition that most closely approximates to the gaseous state, namely, dust fuels, allowing an intimate admixture during combustion with the oxygen of the air and consequently approximately complete combustion.

The "Journal" is pleased to be able to review a work of this nature, written and published in Canada, and takes this opportunity to congratulates the author and the publisher thereon.

SAFETY FIRST HOISTS and CAGES



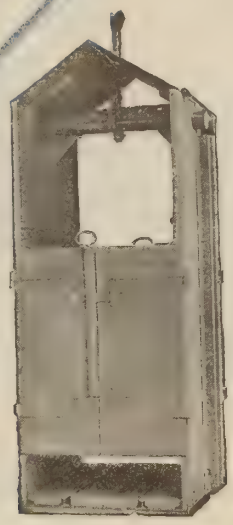
ELECTRIC MINE HOIST, with Drums keyed fast to shaft, so it cannot revolve in either direction except the power is applied.

This type Hoist is made also for Steam Drive.

Either kind, Steam or Electric, is offered in 7 sizes, from 10 to 50 Horse Power.

Send for our Catalog of Mine Hoists, Cars, Cages, Buckets, Etc.

It will interest you.



SAFETY MINE CAGES made to fit your shaft. We build these cages to suit you and your workmen. They are Safe, Strong and Reliable. We guarantee the Safety Device of our Mine Cages to be quick and positive in its action. It can be relied on to work and to hold the cage safely at any time in case of accident. The springs are strong, the dogs are properly designed and adjusted, and the whole device is made amply strong for any emergency.

Marsh Engineering Works, Limited, *ESTABLISHED 1846* **Belleville, Ontario**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

BOOK REVIEW.

Petrology for Students. An introduction to the Study of Rocks under the Microscope. By Dr. Alfred Harker, Reader in Petrology to the University of Cambridge. Revised fifth edition, 1919. Price 8s. 6d. Cloth, 5 by 7¼ inches. 300 pages with Index. Illustrated. Cambridge University Press. This little volume is a textbook designed for the use of students under the direction of a teacher and having access to demonstrations on actual rock specimens under the microscope. No colored plates are shown. The work is a standard students' textbook used in British schools, under the circumstances mentioned, and the rock specimens illustrated are chiefly drawn from British sources, with the addition of some specimens from the British Colonies and the American Continent.

REASONS FOR EMIGRATION OF MID-EUROPEANS FROM CANADA TO THEIR HOMES.

The following explanation of the reasons which are impelling many former residents of central Europe to return to their homes was given by the travelling agent of a steamship line to the Glace Bay "Gazette" recently, and is of sufficient general application to suggest re-publication for the benefit of our readers.

The steamship representative stated:

"The chief reason for these foreigners going home is that they have their families in the old country. They have not heard from them during the war and are only now receiving letters from home. Almost every one of them is a born farmer. There has not been any production in the war stricken countries for the past five years, and for that reason the value of the land has decreased. They have been receiving letters from their people lately stating that land can be purchased very reasonably.

"During their stay in Canada every one has accumulated from $2000 to $3000 in Canadian currency and at the present low rate of exchange in their own country money,, if a foreigner possesses $2000 in Canadian money it is worth about 200,000 kronen in his native money, which in their own countries is considered a vast fortune.

"That is one of the main reasons why the foreigners wish to leave the country. They feel they can do much better in their own native country, especially as the country needs them more than they ever did. In the most devastated portions of Europe, the majority of people left I imagine, are cripples, under-aged, over-aged and helpless women and children. Thus there are not many people to rebuild the country to its pre-war condition.

Most of the foreigners leaving this country will be Galicians and Poles, which represent the majority of the foreign element in Canada. After the ratification of the peace treaty almost all this element in Canada will depart for their native lands."

Nelson, B.C.—C. A. Seaton, of the staff of the Sullivan Mine, Consolidated Mining & Smelting Co., Kimberly, has taken over the management of the Molly Gibson Mine, situated on Mount Kokanee, a property operated by the Company. H. L. Batten, who has held this position for some time, is moving to the Coast.

IDLE PITY GIVING WAY TO PRACTICAL EFFORT ON BEHALF OF CANADA'S SIX THOUSAND BLIND.

You have doubtless been interested in what you have read or heard regarding the progress of a national effort on behalf of the blind of Canada.

Do you realize just what this effort means?

Here are some of the things that are being done:

Industrial training and employment is being provided for the blind in centres established in Halifax, Toronto, Winnipeg and Vancouver.

Useful handicrafts and the reading and writing of embossed characters are taught in the homes of those blind people who for various reasons are unable to take training at one of the regular centres.

The product of the home-workers is bought and sold.

Personal contact is established with recently-blinded persons, and with cases which are sometimes so old that they become new in a very real sense. This work is done by an experienced Field Agent.

Books, magazines, and music in embossed types are circulated free to the blind of Canada. The monthly average circulation of books, etc., is close to eight hundred. The Institute also arranges for the transcription of music for any of its members at cost-price.

An active publicity propaganda dealing with various dangers to which the eye is subject is carried on, and this is followed up with personal work, looking to the larger co-operation of medical men and nurses, employers of labor, Boards of Education, etc., in the vital matter of preventing blindness.

A residence and training-centre, "Pearson Hall," has been provided where blind soldiers may find congenial conditions while taking vocational instruction. In this connection it may be interesting to know that the Institute has entered into an agreement with he Department of Soldiers' Civil Re-Establishment, under which the Institute has established an after care department for Canadian Soldiers blinded in the war.

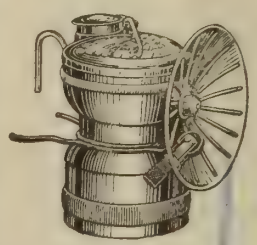
There are other things, but they may all be summed up by saying that the Institute endeavors in every practical way to advance the interests of the blind and to ameliorate the conditions under which they live.

Will you aid in supplying the most vital need of this work?

Then mail your cheque to the Canadian National Institute for the Blind, 36 King St. East, Toronto, Ont.

Note: We are glad to give space to the foregoing announcement.—Ed.

SUN*RAY



WORKS WITHOUT WATCHING

Every *SUN*RAY* is built upon lines proven correct by experience, — built of absolutely the best material and with the best workmanship procurable.

The *SUN*RAY* stands as a triumph in carbide lamp building. Its construction combines with greatest efficiency and durability a simplicity that is the wonder of all who see it. This is the feature that commends itself to all who have ever had trouble with carbide lamps. It means minimum attention required, greatest ease of operation and lowered operating expense. The *SUN*RAY* represents the nearest to perfection in mining lamps.

DEWAR MFG. COMPANY
